NOTICE
CUMULATIVE INDEX(ES)
PUBLISHED SEPARATELY

PUBLISHED MONTHLY BY
THE AMERICAN PSYCHOLOGICAL ASSOCIATION, INC.
at Prince and Lemon Sts., Lancaster, Pa. 17604 and
1200 SEVENTEENTH ST., N. W., WASHINGTON, D. C. 20036

EQUAL EMPLOYMENT OPPORTUNITY

The American Psychological Association endorses equal employment opportunity practices, and we reserve the right to edit all copy and to refuse ads that are not in consonance with the principles of Title VII of the Civil Rights Act of 1964.

Second-class postage paid at Lancaster, Pa., and at additional mailing offices.

Business communications are to be addressed to the Washington Office of the American Psychological Association. Correspondence on production and right matters is to be directed to the Managing Editor; on advertising and sales, to the Advertising Manager; and on subscriptions and address changes, to the Subscription Office. Changes of address must reach the Subscription Office by the tenth of the month to take effect the following month. Copies undelivered because of address changes will not be replaced; subscribers should notify the post office that they will guarantee second-class forwarding postage. Other notices for undelivered copies must be made within four months of publication.

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract, four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) Single cell activity in the hypothalamus in intact and adrenalectomized rats. (4) *Psychological Journal*, (5a) 1970(Jan), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.)—(10) *Journal abstract*.

1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address: A mailable address is included for the first-named author only.

3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., [Parapsychology].

4—Primary journal title in full.

5a—Year and month of the primary publication issue.

5b—Volume number followed by issue number in parentheses.

5c—Inclusive pagination of the article.

6—Text of the abstract.

7—Reference to a previous entry in *Psychological Abstracts*.

7a—PA—*Psychological Abstracts*.

7b—PA volume number.

7c—PA abstract number.

7d—PA issue number where abstract number is unavailable at time of publication. When only the issue number is given, in one must consult the Author Index of the PA issue noted in order to determine the abstract number for the author and article cited.

8—Summaries included in the primary source are listed when in language(s) other than that of the article.

9—Number of references is included when 15 or more. May also appear as pages, e.g., (3 p. ref.).

10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U. Chicago, Medical School*) (4) *Sleep and dreams*. (5) New York, N.Y.: (6) Appleton-Century-Crofts, (6a) 1970. (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper).

1—Name of author(s) or editor(s). If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Designation of editor.

3—Address of first-named author/editor only.

4—Book title.

5—Place of publication.

6—Publisher's name.

6a—Year of publication.

6b—Prepagination.

6c—Total pagination.

6d—Hardcover price.

6e—Paperback price.

BOOK CHAPTER ENTRY

(1) Wilson, J. T. (2) (*U. California, Santa Cruz*) (3) *The stages of sleep*. (4) In (4a) J. J. Jones (4b) (Ed.), (4c) "Sleep and dreams." (5) (See (5a) PA, (5b) Vol. 45: (5c) Issue 1) (6) 17-47.

1—Author(s) of chapter cited. If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address of first-named author only.

3—Chapter title.

4—Reference to entry in PA which includes bibliographic information for the whole book. When only the issue number is given (see 5c), one must consult the Author Index of the PA issue noted in order to determine the abstract number for the Editor of the book.

4a—Editor's name.

4b—Editor designation.

4c—Book title.

5—Referral information.

5a—PA—*Psychological Abstracts*.

5b—Volume number.

5c—Issue number.

6—Inclusive pagination for cited chapter.

A READER'S GUIDE TO LINGUISTIC LITERATURE

Psychological Abstracts, Psychiatry Abstracts, and other abstracting services are available for the study of the human mind. The reader is advised to consult these sources for the latest information on the state of the art in the various branches of the study of the human mind.

The following is a list of the most important works in the field of linguistics, arranged in alphabetical order of the author's name. The list is intended to be a guide to the literature, and not a bibliography. It is not intended to be exhaustive, but to give the reader a general idea of the state of the art in the various branches of the study of the human mind.

VOLUME 45

JANUARY 1971

NUMBER 1

EDITORIAL NOTE

The publishers of *Revue de Psychologie et des Sciences de l'Education* are interested in establishing exchange subscriptions between their journal and other similar psychological journals. Interested publishers may contact Miss M. F. Voisin, Exchange Department, *Revue de Psychologie et des Sciences de l'Education*, Groupe de Louvain, A.S.B.L., 104, Tienestraat, 3000 Leuven-Louvain, Belgique.

ERRATUM

In the abstract of the S. I. Shapiro and Irene Ponce article (see PA, Vol. 44:11804), the subject population should have been 200 undergraduates rather than 191 undergraduates.

GENERAL

OBITUARIES

1. Zangwill, O. L. **Obituary notice: Sir Frederic Bartlett (1886-1969).** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 77-81.—Describes F. Bartlett's contributions to experimental psychology and his influence on the study of social factors, memory, thinking, and skill and human performance.

HISTORY

2. ———. **Some unpublished letters of Freud.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 419-427.—These 9 unpublished letters, written when Freud was between the ages of 16-18, were to his friend Emil Fluss and describe Freud's adolescent adventures and thoughts.—J. Chyatte.

3. Crannell, Clarke W. **Wolfgang Köhler.** *Journal of the History of the Behavioral Sciences*, 1970 (Jul), Vol. 6(3), 267-268.—An eyewitness report by an American student at the time (1933) of Köhler's extraordinary courage in his defiance of the Nazis during his career as Director of the Psychological Institute in Berlin.—C. M. Franks.

4. Harms, Ernest. **Awareness: A new psychological category.** *Journal of the History of the Behavioral Sciences*, 1970 (Jul), Vol. 6(3), 263-264.—"It would appear that we are now witnessing the emergence of a new psychological category the importance of which lies especially in the fact that it challenges 1 of the most basic psychological concepts of the past hundred years, i.e., the concept of consciousness."—C. M. Franks.

5. MacLeod, R. B. (Cornell U.) **Newtonian and Darwinian conceptions of man, and some alternatives.** *Journal of the History of the Behavioral Sciences*, 1970 (Jul), Vol. 6(3), 207-218.—Over the past century or so, the psychologist's conception of man has slipped into

2 molds, patterned after either Newtonian physics or Darwinian biology. While both have served their purposes, alternative models—still within the realm of science—exist. Discussed here are verstehende Psychology and field theory.—C. M. Franks.

6. Merrifield, Marilyn & Watson, Robert I. (U. New Hampshire) **Eminent psychologists: Corrections and additions.** *Journal of the History of the Behavioral Sciences*, 1970 (Jul), Vol. 6(3), 261-262.—Clerical errors in the reporting of biographical data (see E. L. Annin, E. G. Boring, & R. I. Watson, PA, Vol. 43:3229) pertaining to certain eminent psychologists have now come to light. Corrections are noted and some additions made.—C. M. Franks.

7. Yaroshevskii, M. G. (Inst. of the History of Science & Technology, Moscow, USSR) **V. I. Lenin i krizis psikhologii na rubezhe XX stoletiya.** [V. I. Lenin and the crisis of psychology at the turn of the century.] *Voprosy Psikhologii*, 1970 (Mar), Vol. 16(2), 46-58.—Presents a historical discussion of the criticism of the idealist notions of Wundt and Brentano by Mach and Avenarius and of Lenin's criticism of the views of the latter 2 as idealistic despite their seemingly materialistic flavor. (English summary)—L. Zusne.

PHILOSOPHY

8. Bloor, David. **Is the official theory of mind absurd?** *British Journal for the Philosophy of Science*, 1970 (May), Vol. 21(2), 167-183.—Examines Ryle's arguments to the effect that the "official theory of mind" is absurd. The theory of mind is likened to postulated theoretical entities in physical science. As such the theory becomes an "embryonic explanatory theory" of behavior with a status much like that of atomism before Dalton. By showing the ineffectiveness of Ryle's arguments when applied to atomism the author is able to throw into question the same arguments when used against the theory of mind. The theory of mind is defended against the charge that it is logically absurd, but no attempt is made to demonstrate that the theory is true.—P. E. Lichtenstein.

9. Ghosal, Hironmoy. **Jean-Paul Sartre.** *Samiksa*, 1967, Vol. 21(4), 169-179.—Presents an analysis of Sartre's personality from a study of his autobiography and discusses how this relates to his existential philosophy.

10. Kolbanovskii, V. N. (Inst. of Psychology, Moscow, USSR) **V. I. Lenin o roli sotsial'no-psikhologicheskogo faktora v obshchestvennoi zhizni.** [V. I. Lenin on the role of social psychological factors in social life.] *Voprosy Psikhologii*, 1970 (Mar), Vol. 16(2), 124-142.—Presents an analysis of how Lenin used social psychological insights to decide on the suitability of the various social classes and groups for his revolutionary purpose as well as in winning them over to his ideas. (English summary) (20 ref.)—L. Zusne.

11. Korotkova, G. P. *Printsipy tselostnosti*. [The principles of wholeness.] Leningrad, USSR: Leningrad U., 1968. 160 p.—Analyzes several general philosophical and methodological problems arising in the development of contemporary biological science.—I. D. London.

12. Pitcher, George. (Princeton U.) *Pain perception*. *Philosophical Review*, 1970 (Jul), Vol. 79(3), 368-393.—Argues "that in standard cases to feel a pain is to be (directly) aware of a perfectly objective state of affairs ... [i.e.] a part of one's body that is in a damaged, bruised, irritated, or pathological state, or that is in a state that is dangerously close to being one or more of these kinds of states."—H. Rujia.

13. Ricoeur, Paul. (U. Paris, France) *Freud and philosophy: An essay on interpretation*. Trans. D. Savage. New Haven, Conn.: Yale U. Press, 1970. xiii, 573 p. \$15.

14. Shorokhova, E. V. (Inst. of Philosophy, Moscow, USSR) *Leninskie idei o potrebnostyakh lyudei*. [Lenin's ideas concerning human needs.] *Voprosy Psikhologii*, 1970 (Mar), Vol. 16(2), 97-109.—While Marxism recognizes the importance of ideas in the historical progress of mankind, it seeks the roots of ideas in the needs of people. The thesis that thought and feelings are determined by the social and historical conditions is a point of departure for the psychological analysis of human motivation within the framework of dialectic materialism. An account of Lenin's ideas concerning this problem area is given. (English summary) (28 ref.)—L. Zusne.

15. Shorokhova, E. V. (Ed.) *Metodologicheskie i teoreticheskie problemy psikhologii*. [Methodological and theoretical problems of psychology.] Moscow, USSR: Nauka, 1969. 376 p.—Presents a collection of 11 contributed papers in the form of chapters, presenting the results of studies on the philosophical problems of psychology. Chapters: "[a] the principle of determinism in psychology, [b] the methodology of psychology and the principle concerning the connection of consciousness and activity, [c] the principle of development in psychology, [d] on the interconnection of the theory and history of psychology, [e] the individual approach as a principle of psychology, [f] methodology and methods of psychological research, [g] on some methods of constructing models in psychology, [h] physiological methods of studying psychic activity, [i] the methodological significance of medical [pathological] psychology, [j] the methodological aspect of the problem of the subjective, [and k] man and the world (excerpts from a manuscript [by S. L. Rubinshtein])."—I. D. London.

16. Smirnov, A. A. (Inst. of Psychology, Moscow, USSR) *A. I. Gertsen i problemy psikhologii*. [A. I. Gertsen and the problems of psychology.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 25-33.—On the occasion of the 100th anniversary of A. I. Gertsen's (1812-1870) death some of the psychological ideas of this early Russian revolutionary-philosopher are discussed. (English summary)—L. Zusne.

17. Smirnov, A. A. (Inst. of Psychology, Moscow, USSR) *Leninskaya teoriya otrazheniya i psikhologiya*. [Lenin's theory of reflection and psychology.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(2), 3-33.—Discusses the importance of Lenin's theory of reflection as the philosophical foundation of psychology and his criticism of idealistic views of sensations. The view of sensations as symbols that inadequately reflect reality is

contrasted with Lenin's view according to which symbols ultimately reflect objective reality. The thesis that the reflection of reality is an active process has the corollary that mind and activity form a unitary whole, mental processes being different kinds of activity. (English summary) (61 ref.)—L. Zusne.

18. Spicker, Stuart F. (Ed.) *The philosophy of the body: Rejections of Cartesian dualism*. Chicago, Ill.: Quadrangle, 1970. x, 367 p. \$15(cloth), \$2.95(paper).

19. Vedenov, A. V. (Inst. of Psychology, Moscow, USSR) *V. I. Lenin i stanovlenie lichnosti rabochego kak aktivnogo deyatelya obshchestvennogo razvitiya*. [V. I. Lenin and the formation of the personality of the worker as an active participant in societal development.] *Voprosy Psikhologii*, 1970 (Mar), Vol. 16(2), 110-123.—Discusses Lenin's idea that the personality of the working man is formed in the process of his active participation in the various phases of the revolutionary struggle to overthrow the capitalist order. (English summary) (16 ref.)—L. Zusne.

PARAPSYCHOLOGY

20. Beloff, J., Cowles, M., & Bate, D. (U. Edinburgh, Scotland) *Autonomic reactions to emotive stimuli under sensory and extrasensory conditions of presentation*. *Journal of the American Society for Psychical Research*, 1970 (Jul), Vol. 64(3), 313-319.—20 schoolboys were tested for their GSR reactions on being presented unexpectedly with their self-image or own name. Presentation was sensory (by means of slides), and extrasensory, using a set of photoprints with 1 author acting as agent. Scoring was done blind by another author who had to pick out the most salient deflections of the polygraph record. On this basis 2×2 stimulus response contingency matrices were set up and analyzed. The sensory runs gave an overall phi contingency coefficient of .453, which is overwhelmingly significant, but the extrasensory runs gave a phi of only .008, which is almost exactly at chance expectation.—*Journal abstract*.

21. Eisenbud, Jule, et al. (U. Denver) *Two camera and television experiments with Ted Serios*. *Journal of the American Society for Psychical Research*, 1970 (Jul), Vol. 64(3), 261-276.—In the 2 experiments Ted Serios succeeded in putting onto videotape (by no known mechanical means) images corresponding to those he put onto camera film in the experiments in question. A detailed study of the appearance and dissolution of the video images obtained is possible through a 24 frame/sec filmstrip made of the videotape record. The significance of various aspects of the data, including the relation of the images to a hidden target provided in 1 of the experiments, is discussed.—*Journal abstract*.

22. Krippner, Stanley. (Maimonides Medical Center W. C. Menninger Dream Lab., Brooklyn, N.Y.) *Electrophysiological studies of ESP in dreams: Sex differences in seventy-four telepathy sessions*. *Journal of the American Society for Psychical Research*, 1970 (Jul), Vol. 64(3), 277-285.—An analysis was made of 74 telepathy sessions involving 14 male and 9 female agents and 41 male and 32 female Ss. There was a total of 55 "hits" and 22 "misses," producing a (significant) chi-square ($p < .001$, 1 degree of freedom). When a male served as S, there were 31 hits and 10 misses ($p < .001$) but when a female served as S, the chi-square was no

statistically significant. The data were not significant when a female agent and a female S were paired; neither were they significant when a male agent and a female S were paired. However, significant results were obtained when a male agent and a male S were paired ($p < .03$) and when a female agent and a male S were paired ($p < .05$). (15 ref.)—*Journal abstract*.

23. **Morris, Robert L.** (Psychical Research Foundation, Durham, N.C.) **Psi and animal behavior: A survey.** *Journal of the American Society for Psychical Research*, 1970 (Jul), Vol. 64(3), 242-261.—Presents a survey of evidence of psi in animals (homing and psi-trailing, hive behavior, "thinking" animals, and experimental evidence based on choice and emotional behavior), and discusses methodological problems likely to be met by anspsi researchers. "The guidelines offered ... are intended to bring together the methodologies of animal behavior research and parapsychology." (39 ref.)—*R. A. White*.

24. **Moss, Thelma; Paulson, Morris J., Chang, Alice F., & Levitt, Marc.** (U. California, Center for the Health Services, Los Angeles) **Hypnosis and ESP: A controlled experiment.** *American Journal of Clinical Hypnosis*, 1970 (Jul), Vol. 13(1), 46-56.—Teams of transmitter and receiver (in isolated rooms) used "emotional episodes" as stimulus material for the transmitter to "send" the receiver in order to learn if hypnosis would facilitate telepathic rapport. 8 teams of 14 "hypnotized" and 9 "nonhypnotized" teams completed the required 6 sessions of 24 trials; the 4 teams achieving statistical significance all belonged to the "hypnotized" group.—*M. V. Kline*.

25. **Stanford, Rex G. & Pratt, J. G.** (U. Virginia) **Extrasensory elicitation of sensorially acquired response patterns?** *Journal of the American Society for Psychical Research*, 1970 (Jul), Vol. 64(3), 296-302.—An ESP S, in guessing whether the white or green side of a concealed card was upward, developed guessing habits related to the sides of the outer cover enclosing each colored card. These covers were themselves then randomized as to order and side upward and concealed in opaque containers. This was done in most series by a 2nd E out of sight of the S and the testing E. The responses associated with each cover side as shown by the ratios of "white" to total guesses were related in the sensory and concealed situations as shown by high positive correlations between test series. These results are compatible with the hypothesis that habits formed in a sensory situation can also function when the relevant stimulus is presented extrasensorially.—*Journal abstract*.

26. **Turner, Malcolm E. & Osis, Karlis.** (Emory U.) **A probability model for symbol-calling experiments.** *Journal of the American Society for Psychical Research*, 1970 (Jul), Vol. 64(3), 303-312.—"A new mathematical model is needed which would more comprehensively indicate the ESP processes in whatever measure they might occur (psi-missing or psi-hitting; direct hits or displacements). We hope that more stable relationships between ESP and other variables—personality traits, moods, hypnosis, distance, etc.—will emerge if comprehensive measures which more adequately represent the ESP processes become available. The probability model which follows is not the final solution; it is rather our contribution toward the development of more comprehensive assessment methods for use in ESP research."—*R. A. White*.

THEORY & SYSTEMS

27. **Bibring, Edward.** **The development and problems of the theory of the instincts.** *International Journal of Psycho-Analysis*, 1969 (Jul), Vol. 50(3), 293-308.—The biological life instincts which create tensions, the sexual instincts, the ego instincts, with their aim of maintaining life, and the pleasure principle are related to each other; the death instincts which seek to cancel out tensions, the instincts of destruction at work within, aggressiveness directed outwards, the trend towards a state of rest (Nirvana), and the inclination to suffer are also related to each other. Instinct operates in a directive fashion on biological events. It becomes differentiated and concentrated into centers of tension which are somehow bound to organic phenomena as sources; it turns outwards on an object, strives after an aim which consists externally in a particular kind of behavior towards that object and internally in removal of a state of excitation. How it operates is not clear. What it is doing when it is directed towards objects on which it carries out purposive actions can be seen. Concepts are vague and ill defined. Some advance into this field is advocated even if there is an unawareness of facts or if there are operational definitions.—*Journal summary*.

28. **Kernberg, Otto F.** **A contribution to the ego-psychological critique of the Kleinian school.** *International Journal of Psycho-Analysis*, 1969 (Jul), Vol. 50(3), 317-333.—Summarizes a recapitulation of various critics of Kleinian theory. These concern acceptance of the inborn death instinct which determines anxiety, innate knowledge of genitals and intercourse, general lack of consideration of biological development, the "pushing back" of intrapsychic development, neglect of environmental factors, lack of structural differentiation within both ego and superego formation, lack of differentiation of normal from pathological development, vagueness of terminology, application of identical techniques to all patients regardless of illness, neglect of the reality of the analytic situation, neglect of defense organization of the patient and neglecting to deepen the analytic situation through interpretation, and peculiar use of terms regarding infantile development. Acceptable aspects include importance of early object relations, importance of defensive constellations known as paranoid-schizoid, depressive, manic, importance of aggression in early development, early superego development, application of analytic techniques to children, early defensive operations as contributors to borderline or psychotic behavior, and focus on regressive features in the opening phase of analysis. (43 ref.)—*J. Chyatte*.

29. **Schmeck, Ronald R. & Bruning, James L.** (Southern Illinois U.) **Frustration theory and quality of performance: Elicitation and elimination of competing responses.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 987-994.—Within a Hull-Spence framework, attempts to elucidate the implications of frustration theory regarding the quality of complex task performance. The specific and nonspecific effects of frustration are distinguished. Specific effects relate to the compatible or incompatible nature of the responses directly elicited by the stimulus properties of frustration. Nonspecific effects relate to the increase in the probability of occurrence of competing responses due to the general drive increase produced by frustration. It is proposed that the number and habit strengths of the competing

responses will determine whether the motivational increase produced by frustration is beneficial or detrimental to performance. Further, the competing responses will produce more frustration which will raise the general drive level of the organism and increase the probability that more competing responses will occur. At the same time, the possibility exists that the association of the competing responses with a frustration reaction will cause them to acquire classically conditioned inhibitory properties leading to a decrease in the probability that those particular competing responses will occur again. Finally, the correct response could reduce the frustration produced by the competing responses and produce an increase in the probability of that response recurring. (2 p. ref.)—*Journal abstract.*

30. Tarantino, Santo J. (Florida Atlantic U.) **Toward a conception of behavior based on concepts of approach-withdrawal and adaptation level.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 767-776.—Emphasized the basic responding nature of organisms in an integration of concepts from comparative, physiological, and social psychology. A formulation was offered which states that organisms will make expansive approach responses to stimuli slightly or moderately deviant from the adaptation level and that such responses involve innervation of extensor muscles and are associated with positive affect. Conversely, stimuli strongly deviant from the adaptation level will evoke restrictive withdrawal responses which involve innervation of flexor muscles and are associated with negative affect. An integration of these concepts is used to explain phenomena and data from various areas of psychology. (24 ref.)—*Journal abstract.*

31. van der Leeuw, P. J. **On Freud's theory formulation.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 573-581.—Psychoanalysis has given science a new area of experience (unconscious), a new instrument, and a new experiment in vivo (psychoanalytic situation). Freud's metapsychological way of thinking is a multidimensional approach. The number of viewpoints can be increased when the psychoanalytic situation necessitates it. Only this scientific viewpoint makes empirical science possible. Only then can further development be encouraged. When this is lost we create speculative theories, not science, and we become rigid and closed-minded. It is herein stated that Freud's multidimensional attitude is the purest form of this capacity. (32 ref.)—*J. Chyatte.*

32. Wallerstein, Robert S. & Smelser, Neil J. **Psychoanalysis and sociology: Articulations and applications.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 693-709.—Life is both psychological and social and both forces affect our behavior. Society permits expression and restriction of individual needs. Psychoanalysis and sociology should mesh their aims toward common goals but do not do so because of difficulties in communication. When knowledge is accumulated it is difficult to direct it to purposive action due to value differences, policies, strategies, etc. The task is not to determine value positions but to disseminate scientific knowledge which can act as guidelines for value judgments. (27 ref.)—*J. Chyatte.*

EDUCATION & TRAINING

33. Earley, L. W., et al. (Eds.) (U. Pittsburgh, Medical School) **Teaching psychiatry in medical school: The**

working papers of the Conference on Psychiatry and Medical Education, 1967. Washington, D.C.: American Psychiatric Assn., 1969. ix, 589 p.

34. Tornatzky, Louis G., Fairweather, George W., & O'Kelly, Lawrence I. (Michigan State U.) **Psychology in action: A PhD program aimed at survival.** *American Psychologist*, 1970 (Sep), Vol. 25(9), 884-888.—Discusses the current involvement of psychology in social problems in terms of the citizen-scholar, and the social clinician. It is argued that these roles are inadequate to solve current social problems, since they either have no community experimentation, or have a naive conception of the social change process. A new PhD training program is described in which innovative social subsystems are set up experimentally in the community, evaluated longitudinally, and, if successful, implemented on a wide scale. The focus of such training is described as problem-oriented, experimental, and with a strong interdisciplinary flavor. Details of such a program at a state university are presented.—*Author abstract.*

PROFESSIONAL DEVELOPMENTS

35. Archer, E. James. (U. Rhode Island) **Proceedings of the Forty-Second Annual Meeting of the Midwestern Psychological Association.** *American Psychologist*, 1970 (Sep), Vol. 25(9), 806-816.

36. Barry, John R. (U. Georgia) **Criteria in the evaluation of consultation.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 363-366.—Reviews studies concerned with identifying criteria for judging effectiveness of psychological consultation. It is suggested that a 1st necessity is to identify ultimate goals, and that both the consultee and consultant should take part in formulating them. It is concluded that establishing research controls for measuring effectiveness remains difficult and new methodologies are needed. (17 ref.)—*P. McMillan.*

37. Blackstone, William T. (U. Georgia) **Proceedings of the Sixty-Second Annual Meeting of the Southern Society for Philosophy and Psychology.** *American Psychologist*, 1970 (Sep), Vol. 25(9), 869-873.

40. Iverson, Marvin A. (Adelphi U.) **Proceedings of the Forty-First Annual Meeting of the Eastern Psychological Association.** *American Psychologist*, 1970 (Sep), Vol. 25(9), 817-838.

41. Jacoby, Jacob. (Purdue U.) **The plight of the uniformed Air Force psychologist.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 383-387.—States that the recent report by the ad hoc committee on career status of military psychologists does not reflect adequately the state of affairs for Air Force psychologists. Cross-service pay and grade differences exist, and there are also class distinctions among Air Force psychologists. Recommendations for improving conditions for all uniformed psychologists are (a) adequate and uniform entry levels for all PhD psychologists, (b) entitlement to "incentive" pay, (c) available preinduction counseling concerning psychological work being conducted within the service.

(d) establishment of a program in which all uniformed psychologists could discuss their research and problems in military psychology, and (e) compilation by the American Psychological Association of a publication on professional military opportunities.—*A. M. Berg.*

42. Mayer, Ronald W. (San Francisco State Coll.) **Proceedings of the Fiftieth Annual Meeting of the Western Psychological Association.** *American Psychologist*, 1970 (Sep), Vol. 25(9), 787-805.

43. Prescott, Suzanne. (American Psychological Association, Washington, D.C.) **The utility of communications media for practitioners.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 389-391.—Reports selected results of a larger survey of information needs of psychologist practitioners. In a 1969 survey, 292 practitioners named the areas in which they most recently needed information. 39% of the respondents indicated a need for method and procedure for diagnosing and treating disorders, and 36% indicated specific data, conclusions, or general points about a topic. In another survey, a comparison between books and journals showed a preference for books as more useful in meeting information needs. The role of workshops and other informational media, including audiovisual materials, is reviewed.—*P. McMillan.*

44. Reiff, Robert. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Psychology and public policy.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 315-330.—Presents the thesis that the growth of psychology as a profession and an applied science during the last 50 yr. has been related to its activities during and following World War I and II. Problems associated with psychology's participation in the resolution of social issues is reviewed. It is concluded that psychology has a responsibility to respond to public and government need for "more knowledge about how to make human institutions more effective for human development." Comments by M. B. Smith and G. A. Miller and a response by R. Reiff are included.—*P. McMillan.*

45. Simon, Leonard J. (City Coll., City U. New York) **The political unconscious of psychology: Clinical psychology and social change.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 331-341.—Discusses the position that psychology, especially as a mental health profession, may have difficulty distinguishing between its professional and political roles. It is suggested that while clinical psychology has many liberals among its practitioners, its emphasis on intrapsychic causation has resulted in its movement away from active involvement in social change. (37 ref.)—*P. McMillan.*

46. Simpkins, Gary & Raphael, Phillip. (California State Coll., Los Angeles) **Black students, APA, and the challenge of change.** *American Psychologist*, 1970 (May), Vol. 25(5), xxi-xxvi.—Presents a revised and expanded version of a report of the joint committee, composed of members of the Association of Black Psychologists, the Black Students Psychological Association (BSPA), and the American Psychological Association (APA) to the APA Council of Representatives. 5 areas of major concern and plans for their implementation are outlined. These areas include: (a) "recruitment of Black students into psychology," (b) "recruitment of Black faculty members into psychology," (c) "gathering and disseminating of information concerning the availability of various sources of financial aid for Black students," (d) "the design and provision of programs offering meaningful community experience for Black

students in the field of psychology," and (e) "the research and development of terminal programs at all degree levels that equip Black students with the tools necessary to function within the black community." It is suggested that APA members in all fields can assist the implementation of these goals by providing professional expertise to students, using the influence of APA to accomplish academic reforms, and aiding in establishing and funding. Possible funding sources are envisioned as foundations, federal government, philanthropic individuals, and industrial donations. The governmental structure of the BSPA and the purpose for which funds will be used are also outlined.—*M. Maney.*

47. Spears, William D. (Auburn U.) **Proceedings of the Sixteenth Annual Meeting of the Southeastern Psychological Association.** *American Psychologist*, 1970 (Sep), Vol. 25(9), 855-868.

48. Van Cott, Harold P. (American Psychological Assn., Washington, D.C.) **National Information System for Psychology: A proposed solution for a pressing problem.** *American Psychologist*, 1970 (May), Vol. 25(5), i-xx.—Describes the existing system of information exchange within psychology, discusses how effectively it functions in terms of quantity, quality, relevance, timeliness, and efficiency, and outlines the development and organization of a new plan, the National Information System for Psychology (NISP). This system, as now envisioned, will consist of 3 components: (a) a primary publication system with 4 publication channels—scientific memoranda, psychological dissemination, journals, and "The Archives of Psychology"; (b) a system of bibliographic services and publications, characterized by a centralized machine-readable data base and a capability to selectively retrieve and repackage material from this data base; and (c) supports to the informal process of communication which would amplify existing channels, develop new ones, alleviate producer burden, and reduce the amount of redundant requests in the channels. It is emphasized that all these proposals are based on the philosophy that: (a) changes will be introduced slowly and evaluated carefully, (b) all permanent modifications will be contingent on approval of the governing structure of the American Psychological Association, (c) periodic feedback from those affected by changes will be obtained, and (d) ultimately the income from NISP's information services will cover the costs of operation. (34 ref.)—*M. Maney.*

49. Wright, Logan. (U. Oklahoma) **The Albee Report and the professional psychologist.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 377-380.—Discusses unfavorable implications to professional psychology of an affirmative vote on the final recommendations of the 1967 Commission on the Composition of Council (Albee Report). Special attention is given to Recommendation 9, which if approved would eliminate representation from state associations on the American Psychological Association Council of Representatives. It is concluded that a "fair and acceptable solution" should include such representation.—*P. McMillan.*

50. Yaker, Harold E. (Hofstra U.) **A note on the question: How well known are APA award winners?** *Journal of the History of the Behavioral Sciences*, 1970 (Jul), Vol. 6(3), 265-266.—27 1st-yr graduate students in psychology were asked to rate the extent of their knowledge concerning the 39 Winners of the American Psychological Association Award for Distinguished Scientific Contributions. At 1 extreme, all 27 students

were familiar with the names Tolman and Skinner; at the other extreme, the relatively total unknowns were Birren, Nancy Bayley, and Richter.—C. M. Franks.

INTERNATIONAL PSYCHOLOGY

51. Batsan, V. Na rodine S. S. Korsakova. [In the home town of S. S. Korsakov.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 135.—Presents details of a commemoration of the Russian psychiatrist's birthplace.—J. D. London.

[All-Union Conference on Social Psychology.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 173-177.—Presents the proceedings of a 1969 conference organized by the Moscow Institute of Psychology. Of the 250 who attended, 45 presented papers.—L. Zusne.

53. Rozanova, T. V., Chuprikova, N. I., Lubovskii, V. I., & Farapova, E. A. XIX mezhdunarodnyi psikhologicheskii kongress. [19th International Psychological Congress.] *Voprosy Psikhologii*, 1970 (Mar), Vol. 16(2), 173-184.—To complement previously published accounts of the proceedings of this Congress as a whole, a more detailed report is presented on the papers read and symposia held in the areas of thinking, speech, memory, emotions, generalization, RT, abnormal psychology, and exceptional children.—L. Zusne.

54. Zavalishina, D. N. Ocherednaya sessiya tsentral'nogo soveta obshchestva psikhologov SSSR. [Regular meeting of the Central Committee of the USSR Psychological Association.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 170-172.—Presents the proceedings of a 1969 meeting held in Moscow.—L. Zusne.

GENERAL BOOKS & REFERENCE WORKS

METHODOLOGY & RESEARCH TECHNOLOGY

55. Brozek, Josef. (Lehigh U.) A note on historians' unhistoricity in citing references. *Journal of the History of the Behavioral Sciences*, 1970 (Jul), Vol. 6(3), 255-257.—Illustrated with examples from key American texts in psychology, strong objection is made to "(a) Citing only the publication date of the edition the author happened to use, without reference to a classical work's initial publication date. (b) Citing the works published in a foreign language, especially in Russian, by giving only the translated title—whether or not the work has actually been translated—with no information on the language in which the work has actually been published."—C. M. Franks.

56. de Groot, Adriaan D. (U. Amsterdam, Netherlands) *Methodologies: Foundations of Inference and research in the behavioral sciences*. Hague, Netherlands: Mouton, 1970. xviii, 400 p.—Presents a problem-oriented methodology based on a conception of science as a system of activities rather than a system of concepts, statements, and facts. The book is a revised translation of a widely used Dutch text in the area of behavioral sciences.

57. Kalish, Richard A. (U. California, Los Angeles) I am, therefore I think. *Professional Psychology*, 1970 (Sum), Vol. 1(4), 392-394.—Discusses problems that can arise from assigning causality to relationships that may

only be correlated. Several instances are offered "in which the reversal of implicit causal relations would produce new—and sometimes productive—possibilities." Examples are given from educational, child, clinical, and industrial psychology. Some "suspect" reversals are also cited.—P. McMillan.

MODELS & MATHEMATICAL MODELS

58. Gupta, V. P. & Srivastava, S. R. (Panjab U., Advance Center for Research in Mathematics, Chadi-garh, India) Inference for a linear hypothesis model using two preliminary tests of significance. *Trabajos de Estadística y de Investigación Operativa*, 1968, Vol. 19(3), 75-105.—Studies the "behavior of the power function of the test when the proposed... sometimes pool test procedure involving 2 preliminary tests of significance is used for testing the hypothesis of no treatment effects in a linear hypothesis model." 4 mean squares are given in the problem. The aim is to test the hypothesis $H_0: E(V_1) = E(V_2)$ vs. the 1-sided alternative $H_1: E(V_1) > E(V_2)$. It is known that $E(V_1)$ and/or $E(V_2) \geq E(V_3)$. Ways of testing the 2 hypotheses are examined, including the size and power of the test for certain combinations of degrees of freedom. A comparison of the power of the proposed test procedure with that of a never pool test of the same size is also presented.—H. Singer.

59. Williams, Gloria K. (U. Washington) A model of memory in concept learning. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5271.

60. Smith, Douglas K. (Purdue U.) A dynamic component suppression algorithm for the acceleration of vector sequences. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5010.

MATHEMATICS & STATISTICS

61. Anderson, Andy B. (Purdue U.) Brief report: The effect of aggregation on nonmetric multidimensional scaling solutions. *Multivariate Behavioral Research*, 1970 (Jul), Vol. 5(3), 369-373.—Conducted a nonmetric multidimensional scaling analysis on similarities between 12 objects on data gathered from 42 Ss. Each S's data were used to produce a separate configuration. Then, data were aggregated over all Ss and a single solution configuration was obtained. Comparisons between the 2 approaches were made. It was found that aggregation did not produce a configuration which differed greatly from those obtained by analyzing each S's configuration separately. However, the aggregate stress figures consistently indicated a far better fit than did the corresponding individual stress values.—Journal abstract.

62. Barton, D. E. (London U., Inst. of Computer Science, England) The solution of stochastic integral relations for strongly-consistent estimators of an unknown distribution function from a sample subject to variable censoring and truncation. *Trabajos de Estadística y de Investigación Operativa*, 1968, Vol. 19(3), 51-73.—Simple and complicated types of censoring that occur in practice are illustrated in 3 typical cases involving: (a) the varying duration of clinical treatment for diverse Ss, (b) the measurement of track lengths from 1 nuclear event of Type A (initial) to Type B (terminal), and (c) in microphotography where both terminal and initial events may occur outside the system. In addition to the "reduced sample" and "product limit" estimators

noted in the literature of these problems, the advantages and disadvantages of a new "unbiased" estimator are reported. Estimators constructed from stochastic integral relations, the merits of estimators under certain sampling conditions, and the significance of a proposed method for dealing with separate or combined difficulties posed by variable truncation and censoring are also discussed. —H. Singer.

63. **Claudy, John G.** (U. Tennessee) **An empirical investigation of small sample multiple regression and cross-validation.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5273.

64. **Greenhouse, Samuel W.** (National Inst. of Mental Health, Theoretical Statistics & Mathematics Section, Bethesda, Md.) **On the meaning of discrimination, classification, mixture, and clustering in statistics.** *Public Health Service Publication*, 1968, No. 1584, 197-201.

65. **Jain, H. C.** (Defense Science Lab., New Delhi, India) **Availability of a complex system with preemptive repeat repair discipline.** *Trabajos de Estadística y de Investigación Operativa*, 1968, Vol. 19(3), 107-115.—Discusses the behavior of a complex system with 2 types of components (L_1, L_2): the failure of L_1 type contributes to the complete failure of the system, while the failure of L_2 type reduces its efficiency; the failure of L_1 type preempts L_2 type, if the latter is under repair; the L_2 type is repaired on reentering under preemptive repeat repair discipline. The Laplace transforms for various joint probabilities were calculated under the assumptions that the failure occurs in Poisson stream and repair time follows general distribution. The system's availability in normal and reduced efficiency was derived. A comparison of its long run efficiency is represented graphically. —*Journal abstract.*

66. **Johnson, Norman L. & Kotz, Samuel.** (U. North Carolina) **Discrete distributions: Distributions in statistics.** New York, N.Y.: Houghton Mifflin, 1969. xvi, 328 p. \$12.50.

67. **Malhotra, N. K.** (Directorate of Scientific Evaluation, New Delhi, India) **Operational readiness of a complex system having two types of components.** *Trabajos de Estadística y de Investigación Operativa*, 1968, Vol. 19(3), 117-130.—Examines the exponential failure and the waiting and repair time distributions of a complex system having components of Class R_1 with m components and Class R_2 with n components. Differential equations governing the system's behavior are presented and used to derive "the probabilities that the system is operating under normal efficiency, reduced efficiency, waiting to repair or is under repair..." The behavior of a complex system under "steady state" is also considered. —H. Singer.

68. **McNeil, Keith A.** (Southern Illinois U.) **Meeting the goals of research with multiple linear regression.** *Multivariate Behavioral Research*, 1970 (Jul), Vol. 5(3), 375-386.—Discusses multiple linear regression as it relates to several goals of research: predictability, parsimony, replication, and validity generalization. These goals are presented with the development of a well established physical law. The emphasis is upon the per cent of variance accounted for in the criterion under investigation, rather than on statistical significance from random events. Additional remarks concerning curvilinear relationships and data snooping are also presented. H. F. Dingman's (see PA, Vol. 44:9546) canons of reproducibility are discussed within the framework of

multiple linear regression and the goals of research.

69. **Oshanin, D. A.** (Inst. of Psychology, Moscow, USSR) **Predmetnoe deistvie kak informatsionnyi protsess.** [Action on objects as an informational process.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 34-50.—Proposes an algorithm to describe those actions which are directed by the actor at objects or concrete events and which result in their modification. The algorithm represents an ordered sequence of operations whereby information about the current state of the object of action is transformed into purposeful acts by the actor which are directed at the object to achieve a change. This "psychological functional system of object action" is contrasted with such concepts as "motor action," "motor act," and "behavioral act." (English summary) (33 ref.). —L. Zusne.

70. **Poch, Francisco Azorin.** **Algunas aplicaciones de los criterios de espaciamento óptimo.** [Some applications of optimal spacing criteria.] *Trabajos de Estadística y de Investigación Operativa*, 1968, Vol. 19(3), 3-49.—Extends previous results on the determination of optimal allocation of experimental data. Different optimum criteria are possible by combining several measures of the deviation or discrepancy between the true value and the estimate (variance, mean square error, etc.) with different averages of said measures or with the maximum value, so that the measure attains a certain range of values, which need not always coincide with the observational range. Diverse applications are reviewed and solutions are obtained or indicated for several criteria combinations. (25 ref.). —*English summary.*

72. **Zimmerman, Donald W.** (Carleton U., Ottawa, Ontario, Canada) **Expected values of correlated measurements and correction for attenuation.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 907-911.—The correlation between scores on 2 measurements or test procedures in a population is attenuated by variability of the individual measurements. If S 's scores are uncorrelated random variables, X_i and Y_i , the correction for attenuation provides an estimate of the correlation between the expected values, EX_i and EY_i , in the population. However, if S 's scores are correlated random variables, the usual correction formula is not applicable. A general formula which includes correlation between expected values of correlated measurements and which reduces to the usual correction for attenuation in the case of uncorrelated measurements is derived. —*Journal abstract.*

Factor Analysis

73. **Boruch, Robert F.** (American Council on Education, Office of Research, Washington, D.C.) **Extensions of a multitrait-multimethod model to experimental psychology.** *Multivariate Behavioral Research*, 1970 (Jul), Vol. 5(3), 351-367.—Presents a simplified description of restricted maximum likelihood factor analysis of multitrait-multimethod data. The series of hypothetical examples and data are taken from motivational-experimental psychology. Implications of the model and the relations between this approach and other multitrait-multimethod analytic techniques are discussed briefly. (18 ref.). —*Journal abstract.*

74. Fritz, Kentner V. (U. Wisconsin) **Indices of the adequacy of factor extraction suggesting a general function in factor analysis.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 683-688.—In a systematic study of factor-extraction-termination criteria, computer generated data were arranged in matrices having 4, 8, and 16 true factors with 16, 32, and 48 variables for sample sizes of 50, 100, 200, and 500. Results of 4 graphical methods of data treatment involving residuals, factor loadings, number of variables, and sample sizes suggest the possibility of a mathematical approach to factor extraction termination.—*Journal abstract*.

COMPUTERS & PROGRAMING

(Inst. for Problems of Information-Transmission, Moscow, USSR) **Modelirovanie na ETsVM povedeniya membrany nervnogo volokna pri ritmicheskom razdrazhenii.** [Computer simulation of the behavior of nerve fiber membrane under rhythmic stimulation.] *Biofizika*, 1970 (Jan), Vol. 15(1), 147-155.—Utilized the Hodgkin-Huxley model in this mathematical study. It was possible, using this model, to reproduce the effect of summation of sub-threshold stimuli—a process shown to be determined mainly by the time constant of resting membrane. The periodic falling off of impulses and the character of the ionic processes, responsible for this effect, are investigated in detail. The existence of maximal frequencies, produced by the membrane on high-frequency stimulation, lying in the range of 140-170 responses/sec, is demonstrated. A hypothesis is examined which makes change of fiber ionic gradients the cause of its "fatigue" and the gradual transition from long cycles to shorter ones in the process of sustained rhythmic stimulation.—*I. D. London*.

76. Brix, V. H. **You are a computer: Cybernetics in everyday life.** New York, N.Y.: Emerson Books, 1970. 146 p. \$4.95.—Deals with the workings of the human brain as a computer and compares the decision-making process to computer functions. Nontechnical illustrations are provided of cybernetics as a practical science of trial and error.

EXPERIMENTATION & OBSERVATION

80. Gorman, Benjamin. (U. Florida) **Respondent accessibility and respondent surfeit: Refusal rate bias in sampling.** *Rural Sociology*, 1969 (Mar), Vol. 24(1), 75-80.—Hypothesized that refusal rates among respondents to surveys is related to levels of surfeit, i.e., frequency of being contacted by a survey interviewer. Indirect indices of number of callers were accessibility of residence location and social class. 349 dwellings from an estimated universe of 21,800 were contacted from a study of rural and small town residences in the southwest plains. Results suggest that refusal rate is significantly higher in the more accessible dwellings, accessibility being classified along a continuum ranging from town, outlying areas and state highways, main farm roads, secondary farm roads, and isolated dwellings. Refusals within towns by social class was not statistically demonstrated, although the trend was in the right direction.—*P. McMillan*.

EXPERIMENTAL PSYCHOLOGY

PERCEPTION

82. Ross, Helen E. & Gregory, R. L. (U. Stirling, Scotland) **Weight illusions and weight discrimination: A revised hypothesis.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 318-328.—Reports results of 2 experiments with 24 and 3 undergraduate and research students which suggest that there is an optimum density for weight discrimination. This density corresponds to the nonillusory density, as determined by the density at which a visible weight is correctly matched with a hidden weight. The greater the illusion the poorer the discrimination. It is pointed out that similar changes in discrimination occur as a result of peripheral sensory adaptation in many modalities; but that the size-weight illusion, and the associated discrimination changes, is due to a central scaling process. A theoretical model is suggested. (22 ref.)—*Journal abstract*.

Illusion

83. Anstis, S. M. & Moulden, B. P. (U. Bristol, England) **After effect of seen movement: Evidence**

for peripheral and central components. *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 222-229.—In Exp. I, the left eye viewed a sectorized disc rotating to the left, and the right eye viewed a disc rotating to the right, on corresponding retinal areas. When each eye in turn then viewed a stationary disc, the left eye saw a movement aftereffect (MAE) to the right, and the right eye an MAE to the left. It is concluded that these MAEs must be peripheral. In Exp. II, the movement information was shared between the eyes, using a ring of lights which were switched on and off to give rotating phi movement. Each eye saw a random flashing oscillation but the 2 eyes together saw rotation anticlockwise. It is concluded that the clockwise MAE must be central. In Exp. III, the switching program was modified so that each eye saw rotation clockwise, but the 2 eyes together saw rotation anticlockwise. A clockwise MAE was seen, which is concluded to be central. (19 ref.)—*Journal abstract*.

84. Coren, Stanley. (New School for Social Research) Lateral inhibition and geometric illusions. *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 274-278.—Tested the hypothesis that lateral inhibitory processes, operating through the mutual inhibition and displacement of spatially adjacent contours imaged on the retina, account for many of the classical geometric illusions. 2 experiments, with 10 and 12 Ss. were conducted, 1 using an alternative form of the Poggendorff illusion, and 1 an alternative form of the Müller-Lyer. In both instances the illusion was still found to exist, although somewhat reduced in magnitude. Results indicate that lateral inhibition plays a contributory role in illusion formation, but it is not the primary causal mechanism.—*Journal abstract*.

Time

85. Handel, Stephen & Lewis, William E. (Kansas State U.) Effect of practice on the perception of temporal patterns. *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 97-108.—Presented patterns consisting of a set of 8 dichotomous left-right elements in auditory, tactual, or visual modalities, or in modality pairs. In some conditions, all pattern elements were presented in 1 modality; in other conditions, 4 elements were presented in 1 modality and the remaining 4 elements were presented in the 2nd modality. Ss were 8 undergraduates. When all pattern elements were presented in 1 modality, naive Ss organized the sequence into a well-structured pattern while practiced Ss organized the sequence into a pattern beginning at the starting element. When 4 pattern elements were presented in each of 2 modalities, naive Ss organized elements in each modality separately while practiced Ss disregarded the modality structure and organized the sequence into a well-structured pattern. These changes in organization suggest a hierarchy of perceptual modes; perception by modality, i.e., by sensations, is least complex, perception by pattern structure is intermediate, and perception by start point is most complex. Changes in pattern identification rate confirm this hierarchy. Changes in organization and identification found for highly practiced patterns were also found for novel patterns.—*Journal abstract*.

VISION

86. Chainova, L. D., Komarova, I. A., & Zonabend, F. I. Kompleksnaya psikhofiziologicheskaya otsenka chitaemosti znakovoi informatsii. [Complex psychophysiological evaluation of the readability of symbolic information.] *Voprosy Psikhologii*, 1970 (Mar), Vol. 16(2), 163-168.—Slides of conventional cartographic symbols varying in number were exposed for 2 sec. and their recognition difficulty determined. 12 such symbols were selected experimentally to cover the range of difficulty. Recordings were then made in 10 Ss of their EEG, GSR, EMG, and electrooculogram (EOG) in a recognition task in which the number and difficulty of the symbols were varied. The GSR, EOG, and EEG measures were found to reflect the condition of the visual system best. The results obtained make it possible to make decisions regarding informational "saturation" of the visual field, ways of representing symbols, exposure time, and the individual differences. (25 ref.)—*L. Zusne*.

87. Egorov, A. S. & Yakovets, B. N. (Academy of Military Medicine, Leningrad, USSR) Ob osobennostyakh informatsionnogo polska v svyazi s razlichnoi prochnostyu zapominaniya informatsii. [Characteristics of information search as a function of differential stability of memory for that information.] *Voprosy Psikhologii*, 1970 (Mar), Vol. 16(2), 160-162.—Studied the search time for 6 2-digit numbers among other such numbers distributed in a 64-sq checkerboard field as a function of the degree of memorization of the numbers to be searched. Success in search was influenced by the goodness of memory indirectly. When memory was incomplete search occurred on a conscious verbal level; this produced certain sequentiality in the functioning of the cognitive processes, which seldom coincided with the objective display characteristics. It also decreased search efficiency. When retention was good, search occurred automatically, suggesting parallel functioning of several cognitive systems. In this condition the order in which information was encountered was immaterial, leading to a higher level of efficiency in information search.—*L. Zusne*.

88. Engel, G. R. (U. Waterloo, Ontario, Canada) An investigation of visual responses to brief stereoscopic stimuli. *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 148-166.—Describes an analytic model of the temporal properties of visual responses to brief stimuli. The model is based on the notion that visual responses persist for some time after the occurrence of brief stimuli. The model is quantified from data on stereopsis obtained with alternating brief monocular presentations of disparate stimuli with 7 college students as Ss. The relevance of the analysis for the data of experiments using tachistoscopic techniques is discussed.—*Journal abstract*.

89. Grigor'eva, L. P. & Sokolov, E. N. Issledovanie kriticheskogo intervala diskretnosti zritel'nogo analizatora. [Study of the critical interval of discreteness of the visual analyzer.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 61-67.—Studied the critical interval of discreteness—the minimal interval of time for which discrimination of successive visual stimulation is possible and which is a characteristic of the restoration cycle of excitability of the visual system—as a function of place of stimulation in the visual field, flash brightness, and conditions of adaptation. 74 Ss participated. A consid-

erable shortening of the critical interval of discreteness occurred on (a) increase in the density of the retinal receptor-nerve elements, (b) increase in the intensity of the afferent signal, and (c) application of rhythmic stimulation of the visual system. The restoration cycle was lengthened with pathological changes in the retina and optic nerve. It is suggested that the mechanisms of inhibition and posttetanic potentiation participate in its formation, and its duration is an index of "temporary visual acuity."—*I. D. London.*

90. Ivanov, A. I. (All-Union Research Phototechnical Inst., Moscow, USSR) **Metod postoyannykh periodov.** [The method of constant periods.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 171-176.—Discusses the "principle and technique of the method of constant periods" for determining visual thresholds. The relationship, experimentally established in the range of 2.5-8 sec. between magnitude of threshold and the period for reporting sensation makes it possible to procure all thresholds with the same period.—*I. D. London.*

91. Khitun, V. A., Korzun, P. A., Shostak, V. I., & Ohukhova, E. A. **Vosstanovlenie ostroty zreniya posle yarkoi kratkovremennoi vspyskh svetla.** [Restoration of visual acuity after a bright brief flash of light.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 142-143.—Restoration time of visual acuity was determined in 2 series of experiments: (a) after illumination of the whole retina with a flash at 2 levels of brightness; and (b) after illumination, at 1 level of brightness, of the whole retina and of only its central part (6°). Screening out the retinal periphery had no effect on restoration.—*I. D. London.*

92. Kozyr'kova, M. G. **Izuchenie dinamicheskoi ostroty zreniya.** [Study of dynamic visual acuity.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 138-141.—130 20-40 yr. olds were used to study visual acuity in viewing a test object undergoing angular displacement in a horizontal plane. With velocity of $20^\circ/\text{sec}$ and exposition time of 1 sec., visual acuity was the same as in the case of a stationary object. With increase to $40^\circ/\text{sec}$ or decrease in observation time to .5 sec., visual acuity declined by .1. Each successive increase in velocity by $20^\circ/\text{sec}$ lowered visual acuity by .1-2. The presence of a range of individual differences suggests the advisability of using the experimental procedures as a means of selecting personnel for work involving the perception of moving objects.—*I. D. London.*

I. **Primenenie polarizovannogo sveta dlya izucheniya anatomii, fiziologii i patologii glaznogo dna.** [Application of polarized light for study of the anatomy, physiology and pathology of the ocular fundus.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 164-167.—Analysis of the results of ophthalmoscopic examinations of 60 patients shows that the structure of the ocular fundus is better differentiated in polarized light, thereby assisting in the early diagnosis of different affections of the optic nerve and macula lutea.—*I. D. London.*

94. Petrov, Yu. P. **Vliyanie faktorov kosmicheskogo poleta na zritel'nye funktsii.** [Influence of space-flight factors on visual functions.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 124-127.—Examined the visual tasks which face astronauts during flight, and the influence on their performance of physiological and physical factors, operative at various stages of flight—on projection into orbit, during flight, and on return to earth. Discussed are the methods by

means of which the action of these factors can be ameliorated, or the ensuing disturbances of the visual functions may be compensated for.—*I. D. London.*

95. Shostak, V. I. **O nekotorykh osobennostyakh vozdeistviya kratkovremennykh sverkh'yarkikh svetovykh vspyshek na fone polnoi temnovoi adaptatsii.** [On several features characterizing the action of brief superbright light flashes against a background of complete dark adaptation.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 144-146.—7 Ss were used to study photic sensitivity after illumination of the eye by superbright light flashes, along with electrical sensitivity of the eye, electroretinogram, EEG, and critical frequency of disappearance of electrical phosphene. Certain averaged curves of dark and light adaptation were procured. When the central part of the retina was screened out, photic sensitivity of the periphery was restored more rapidly, providing evidence for the inhibitory influence of the photopic afferent system upon the scotopic under the action of superintense stimuli.—*I. D. London.*

96. Sychev, A. A. (Medical Inst., Kharkov, USSR) **O metodike issledovaniya vremeni akkomodatsii u cheloveka.** [On a method for studying time of accommodation in man.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 168-170.—Describes the operation of a newly designed apparatus, which made it possible to procure data on accommodation time in shifting view from object to object placed at different distances from 3 emmetropic and 2 myopic Ss.—*I. D. London.*

97. Tamarova, R. M. (All-Union Research Inst. of Medical Instrumentation, Moscow, USSR) **Ob issledovanii glaznogo dna v polarizovannom svete.** [On examination of the ocular fundus in polarized light.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 158-163.—Presents a detailed description of the ocular fundus, examined in polarized light: vessels, optic nerve disc, macula lutea; followed by a mathematically developed "optic model of the retinal yellow spot," consisting of optically anisotropic layers.—*I. D. London.*

98. Zinchenko, T. P. (Leningrad U., USSR) **O modeli informatsionnogo poliska.** [On modeling informational search.] *Voprosy Psikhologii*, 1970 (Mar), Vol. 16(2), 151-154.—Visual search experiments were conducted with 20 Ss, in which a number of stimulus parameters were varied. Search time was not affected by the number of symbols within subsets. It was affected by the total number of symbol subsets in the visual field, location of the critical subset in the field, degree of organization in the field, and the direction of eye movements. In all experiments variance of search time correlated positively and significantly ($p < .01$) with mean search time. It is suggested that the observed increase in response variance with increasing information content in the visual field must be taken into consideration in formulating any mathematical models of information search.—*L. Zusne.*

Perception

99. Kitaev-Smyk, L. A. **Znachenie zritel'noi informatsii v formirovani prostranstvennogo vospriyatiya v nevesomosti.** [The effect of visual information on space perception under conditions of weightlessness.] *Voprosy Psikhologii*, 1970 (Mar), Vol. 16(2), 155-159.—Tested space perception in 33 Ss during the 25-30 sec. of weightlessness in a power dive of an airplane. In previous tests of weightlessness 10 of the Ss had

experienced the feeling that they were falling, 13 felt that the plane was flying upside down, and 10 had no illusions. In this experiment, blindfolding enhanced the feeling of fear and of falling in Group 1. In Group 2, 9 Ss reported that they no longer felt they were upside down as long as they remained seated. In Group 3, 4 Ss did not report any change when blindfolded, 2 felt as if they were falling when floating freely, and 4 experienced fear. The results are interpreted in terms of differential utilization of visual and gravitational clues by individuals under conditions where these compete or are in contradiction. (19 ref.)—*L. Zusne.*

100. Lacher, Miriam R. & Riegel, Klaus F. (U. Michigan) **Word recognition thresholds as a function of instructions, type of word relations, and associative frequency.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 23-33.—Investigated the effects of restricted association parameters on tachistoscopic recognition threshold ($N = 70$). Specificity of clues, frequency of restricted association between clue and response word, and the interaction between these 2 were statistically significant. Differences in the effect of particular relations (superordinate, coordinate, and attribute) were of borderline significance. No consistent correlation was found between the last finding and type-token ratio, response overlap among the 3 types of relations, or free associative frequency reported in norms. Specificity of clues was related to the correlations between free associative frequency and recognition threshold, the number of whole-word prerecognition responses, and the distribution of prerecognition responses within restricted association distributions. (27 ref.)—*Author abstract.*

101. Lansford, Theron G. & Baker, Howard D. (Tri-State Coll.) **Dark adaptation: An interocular light-adaptation effect.** *Science*, 1969 (Jun), Vol. 164(3885), 1307-1309.—Reports that presentation of light to the left eye simultaneously with adaptation of the right eye to light may accelerate dark adaptation in the right eye. Ss were 1 man and 3 women. The result is that the rod-cone-break and the final threshold of the rods are achieved earlier than when the right eye alone is adapted to light.—*Journal abstract.*

Yu. **Formirovanie zritel'nogo obraza.** [Formation of the visual image.] Moscow, USSR: Moscow U., 1969. 107 p.—Presents the results of research on the "activity of the visual system" in this monograph. Chapters: (a) "methods of studying the activity of the visual system under conditions of image stabilization and under those of free scrutiny," (b) "new data on perception under conditions of stabilization," (c) "manipulative capacity of the visual system and the problem of image invariance," (d) "investigation of vicarious actions in the context of problems of thinking [problem solving]," and (e) "a [proposed] functional model of the sensory link in the visual system."—*I. D. London.*

Size & Distance & Depth Perception

104. Kamenshchikov, Yu. V. **Rol' konvergentsii v vospiryatii udalennosti pri posadaka samolëta.** [Role of convergence in the perception of distance in landing

an airplane.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 134-137.—Ss were 100 flight personnel with normal binocular vision, emmetropic refraction, and visual acuity. In 75% of the Ss, convergence increased the accuracy of gauging the distance of an object (range = 30-50 m.) from 20-50%; however, in 25% of the Ss, convergence had no influence on the threshold of absolute distance.—*I. D. London.*

105. Pantle, Allan & Sekuler, Robert. (Northwestern U.) **Size-detecting mechanisms in human vision.** *Science*, 1968 (Dec), Vol. 162(3858), 1146-1148.—Conducted an experiment to determine whether the human visual system can directly encode the area of retinal images produced by objects of different sizes. Inspecting a pattern of alternating dark and light bars makes it difficult to see a similar pattern presented afterward. This phenomenon can be used to isolate mechanisms responsive to bars of a given width. Results suggest that the human visual system contains several different classes of size detectors, each maximally sensitive to visual targets with sizes in a particular range.—*Journal abstract.*

106. Petrov, K. S. **K voprosu issledovaniya prostranstvennogo zreniya u létного sostava.** [On the study of spatial vision in flight personnel.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 128-129.—Reports results of a study on the perceptual evaluation of absolute distance (determination of the distance of an object from the O) in 100 gunners and navigators with emmetropic refraction and flight experience from 5-25 yr. It is shown that threshold magnitudes for the perception of graded changes in absolute distance range from 10-12 m. It is suggested that this be taken as the standard of spatial vision required of flight personnel.—*I. D. London.*

Color Vision

107. Fol'b, R. L. & Voronina, S. V. (All-Union Research Phototechnical Inst., Moscow, USSR) **Svetovye i tsvetovye porogi ognei na fone raznoi yarkosti.** [Photic and chromatic thresholds of light sources against backgrounds of various brightness.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 49-53.—7 Ss were used to determine achromatic and chromatic binocular thresholds involving steady and flashing light sources against backgrounds of various brightness for 4 colors—yellow, green, blue, and red. Where the achromatic interval for red light is taken as 1, that for blue light attains the value of 1000 and more. With growth of brightness of background, the achromatic interval decreases for all colors. Against a dark background the noticeability of blue and yellow flashing light sources improves as compared with steady light sources.—*I. D. London.*

108. Hepler, Norva. (McGill U., Montreal, Quebec, Canada) **Color: A motion-contingent aftereffect.** *Science*, 1968 (Oct), Vol. 162(3851), 376-377.—After 16 Os alternately viewed green stripes moving up and red stripes moving down for $\frac{1}{2}$ -4 hr. periods, they saw a pink aftereffect when white stripes moved up and a green aftereffect when white stripes moved down. Longer exposures produced aftereffects which were visible 20 hr. after stimulation. Thus, experience which pairs simple attributes (color and motion) of visual stimulation can result in a lasting modification of perception.—*Journal abstract.*

109. Kitaev-Smyk, L. A. *Issledovanie akhromaticheskoi i khromaticheskoi chuvstvitel'nosti pri kratkovremennom deistvii nevesomosti.* [Study of achromatic and chromatic sensitivity under the brief action of weightlessness.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 130-133.—Weightlessness was created for 28-30 sec. by an airplane following a parabolic trajectory, and was studied with and without preceding increase in gravity pull (1.5-1.8 g.). In 5 of 28 Ss studied, photic sensitivity and the visual field were also investigated. In weightlessness, sensitivity to yellow and, to a lesser extent, to red increased, while in a number of cases sensitivity to blue-violet declined. The threshold of scotopic vision also decreased, but the visual field remained unchanged.—I. D. London.

110. Lobanova, N. V. (State Optic Inst., Leningrad, USSR) *Vozmozhnye formy tsvetovogo zreniya.* [Possible forms of color vision.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 39-42.—26 Ss were used to study the spectral sensitivity of the retinal receptors of normal and nonnormal trichromats, using M. M. Bongard and M. S. Smirnov's method for determining the spectral sensitivity of retinal receptors from composition curves. The data suggest the hypothesis that in man there are a total of 4 kinds of spectral sensitivity curves for the receptors of the eye which, combining in 2s or 3s, determine all investigated forms of color vision: normal trichromasia, 3 forms of nonnormal trichromasia (prot-, deuter-, and tritanomalias), 3 forms of normal dichromasia (prot-, deuter-, tritanopia), and 3 forms of almost unstudied nonnormal dichromasia. An 11th form of color vision may logically be added, for which the presence of all 4 retinal receptors is characteristic (tetrachromasia).—I. D. London.

111. Makarov, P. O. (Leningrad State U., USSR) *Mikrointerval'nyi analiz razvitiya zritel'nykh oshchushchenii u cheloveka.* [Microinterval analysis of the development of visual sensation in man.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 57-60.—Microinterval analysis of the emergence of color sensations in man discloses the regular phasic character of their arising: presensation, achromatic sensation, and chromatic sensation. The phasic dynamics are distinctively manifested in color discrimination when 2 stimuli are presented successively. Thus, when 2 short stimuli—1st red, then green—successively stimulate the same retinal area, then on intensification of the one (e.g., green), it will mask the appearance of the other (the weaker red). With a 20-msec interval between flashes, a sensation of mixed color arises; with a 35-55 msec. interval between flashes, the more intense flash dominates with respect to color; with increase of the interval to 75 msec. or more, 2 successive color stimuli are seen—red and green. With the action of 2 color stimuli, a discontinuity emerged in the electroretinogram in the potentials, corresponding to the time that discontinuity was perceived.—I. D. London.

112. Shabanov-Kushnarenko, Yu. P. (Inst. of Radioelectronics, Kharkov, USSR) *Deduktivnoe postroenie modeli nizshei metriki tsвета.* [Deductive construction of a model for the lower measure of color.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 27-29.—Presents a new formulation of Grassman's 3 laws in which the operation of color composition is not utilized, along with a demonstration of the logical equivalence of a mathematically formulated model of the statics of vision and Grassman's laws. The former can be generalized to the case where an image is presented which undergoes change in time and in the visual field.—I. D. London.

Form & Pattern Discrimination Eye Movement

113. McFarland, William H. (U. Washington) *An investigation of ocular response to various methods of sound field auditory stimulation.* *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5277.

114. Podd'yakov, N. N. (Inst. of Preschool Education, Moscow, USSR) *O genezise protsessa upodobleniya v zritel'noi sisteme.* [On the genesis of the process of comparison in the visual system.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 139-141.—24 Ss performed a motor task that simulated eye movements. A shape was traced on a sheet of paper with invisible ink. When a lever-activated beam crossed a contour it would show up in purple. 85% of the Ss used fanning strokes to find the contour when they lost it, the axis of the fan being in the assumed general direction of the contour; only 15% used "cross-hatching" movements when they lost the contour, although this method was more efficient. When instructed to compare the size of the shape with that of a sample, all Ss used a very different type of movement, scanning the whole extent of the sheet with long strokes that went in all directions. The results are thought to support the hypothesis that scanning movements of the eye are of 2 types: 1 is used to locate visual objects, the other serves to judge size, proportions, and other attributes of spatial distribution.—L. Zusne.

117. Spreen, Otfried; Spellacy, Frank J., & Reid, J. R. (U. Victoria, British Columbia, Canada) *The effect of interstimulus interval and intensity on ear asymmetry for nonverbal stimuli in dichotic listening.* *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 245-250.—Investigated the question of ear asymmetry in 48 undergraduates for musical and pitch pattern stimuli with 1-sec interstimulus intervals (ISIs). Results were compared with those obtained in a 1970 study by F. J. Spellacy, using 5- and 12-sec ISIs. Also the effect of intensity on ear asymmetry was examined. Results confirm previous findings of D. Kimura (see PA, Vol. 39:6584) and Spellacy of a left ear superiority for musical stimuli. The size of the difference between ears for music and tonal pattern decreases with increasing length of the ISI. Overall performance level showed a monotonic decrease with increasing length of the ISI. No significant effect of intensity level (50 and 70 db.) was obtained. Results are discussed in relation to a temporary storage model and a perceptual model. (French & German summaries) (28 ref.)—*Journal abstract.*

Perception

118. Massaro, Dominik W. (U. Wisconsin) *Pre-perceptual auditory images.* *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 411-417.—4 female

and 2 male undergraduates in 4 experiments identified the pitch of a 20-msec test tone which was followed by a masking tone after a variable silent intertone interval. The masking tone interfered with the perceptual processing of the test tone such that pitch identification performance improved with increases in the silent intertone interval. Results also indicate that: (a) the amount of interference produced by the masking tone was relatively independent of the similarity of the test and masking tones, (b) dichotic (contralateral) masking was as effective as the binaural case, and (c) presenting the masking tone before the test tone did not disrupt pitch-identification performance. It is concluded that the experiments demonstrate the existence of a central auditory image that remains after a short tone burst is terminated. (17 ref.)—*Journal abstract*.

119. Perl, N. T. (Royal Belfast Hosp. for Sick Children, Child Guidance Clinic, Ireland) **The application of the verbal transformation effect to the study of cerebral dominance.** *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 259-261.—Demonstrated the phenomenon of illusory perception of aurally presented repeated words and tones, with a sample of 48 adults. When the material was presented monaurally, with masking noise to the contralateral ear, an ear effect analogous to that found in dichotic listening experiments was produced. (French & German summaries) (17 ref.)—*Journal abstract*.

120. Stanaway, R. G., Morley, Tania, & Anstis, S. M. (U. Bristol, England) **Tinnitus not a reference signal in judgments of absolute pitch.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 230-238.—Hypothesized that judgments of absolute pitch rely on a subliminal tinnitus (ringing in the ears) which is used as a reference tone. In a series of 144 pairs of trials, S, an undergraduate, alternately measured his own tinnitus and made absolute judgments of pitch by setting a variable tone to match the frequency of a named (target) note. S judged the frequency of the 48 notes spanning the 4 octaves from A flat = 106 Hz. to G = 1584 Hz. It was found that judgments of the pitch of named notes were significantly more accurate ($p < .01$) than had been predicted from the variability of the pitch of tinnitus. There was a low correlation ($r = .246$) between absolute pitch judgments and tinnitus settings made on the same trial. Thus the hypothesis is false. Nevertheless, it is argued that absolute pitch judgments may not require a channel capacity of more than 3 bits/decision. (27 ref.)—*Journal abstract*.

121. Zurif, E. B. & Sait, P. E. (Sir George Williams U., Montreal, Quebec, Canada) **The role of syntax in dichotic listening.** *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 239-244.—Compared in 16 undergraduates identification of dichotically presented pairs of meaningless sequences presented under 2 different conditions—structured and unstructured. The dichotic sequences in both conditions contained the same nonsense syllable stems, English bound morphemes, and English function words. The sequences in the structured condition were grammatically ordered in the sense that if the nonsense stems were replaced by English stems a grammatical sentence would result; as well, the structured sequences were characterized by the acoustic correlates of constituent structure. In contrast, the elements of the unstructured sequences were randomly rearranged and delivered in list form containing none of the overt rhythms of speech. Total accuracy of recognition was found to be significantly superior in the structured condition. In addition,

although right-ear superiority was observed in both conditions, the laterality effect was significant only in the structured condition. (French & German summaries) (19 ref.)—*Journal abstract*.

Speech Discrimination

Audiometry

122. Murphy, E. H. & Venables, P. H. (Birkbeck Coll., U. London, England) **Ear asymmetry in the threshold of fusion of two clicks: A signal detection analysis.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 288-300.—Describes 3 experiments comparing 2 methods of measuring the threshold of fusion of 2 clicks: a signal detection method, and a modified method of constants. Ss were 14, 15, and 20 adults. The former method reveals a significant ear asymmetry effect, which is accentuated when a burst of white noise is presented contralaterally with the clicks. Results are discussed with reference to differentiation of function of the cerebral hemispheres. (22 ref.)—*Journal abstract*.

CHEMICAL SENSES

123. Mitchell, M. J. & Gregson, R. A. (U. Canterbury, Christchurch, New Zealand) **A re-examination of the value of the olfactory power law exponent.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 301-304.—Reexamines the exponent value of the psychophysical power law for olfactory intensity by olfactometric methods over 2 levels of standard stimulus and 2 types of magnitude estimation procedure. 42 undergraduates served as Ss. Neither the method of measurement nor the level of the standard significantly influenced the exponent. A value of .80 was obtained, not significantly different from a value of .72 previously determined by category scaling methods. Both values are considerably greater than exponents previously reported. The differences between studies are attributed to the degree of stimulus control available in the different methods of stimulus presentation.—*Journal abstract*.

ENVIRONMENTAL EFFECTS

SLEEP & FATIGUE & DREAMS

126. Honorton, Charles. (Maimonides Medical Center, William C. Menninger Dream Lab., Brooklyn, N.Y.) **Some current perspectives on the hypnotic dream.** *Journal of the American Society of Psychosomatic Dentistry & Medicine*, 1969 (Jul), Vol. 16(3), 88-92.—Discusses a number of methodological problems, and suggests that future studies in the area should be directed

toward: (a) further exploration of electrophysiological concomitants of nocturnal and induced dreams, and (b) comparison of nocturnal and hypnotic dreams from the same Ss.—*M. V. Kline.*

HYPNOSIS & SUGGESTIBILITY

127. Goldstein, Marvin S. & Sippelle, Carl N. **Hypnotically induced amnesia versus ablation of memory.** *International Journal of Clinical & Experimental Hypnosis*, 1970 (Jul), Vol. 18(3), 211-216.—Divided 33 hypnotizable undergraduates, all capable of achieving the criterion of amnesia for a 7-digit number, into 3 groups: 2 hypnotized and 1 pretend. The distributions of errors for an amnesic performance of these groups were compared with the theoretical chance distribution of errors expected in an amnesic performance. Both hypnotized groups differed significantly from the pretend group and from the theoretical distribution, while the performance of the pretend group did not differ significantly from the chance distribution. The performance of the pretend group conformed to the expectancy for amnesia significantly better than did the performance of either of the hypnosis groups. (Spanish & German summaries)—*Journal abstract.*

128. Hall, James A. & Crasilneck, Harold B. (712 N. Washington, Dallas, Tex.) **Development of a hypnotic technique for treating chronic cigarette smoking.** *International Journal of Clinical & Experimental Hypnosis*, 1970 (Oct), Vol. 18(4), 283-289.—4 hypnotic sessions were found successful, in the majority of cases, in eliminating cigarette smoking without undesirable substitution symptoms. Patients were strongly motivated by the referring physicians and by various nonhypnotic techniques incorporated into the treatment program. Examples are given of the specific nature of both the hypnotic and the nonhypnotic suggestions employed. (German & Spanish summaries)—*Journal abstract.*

129. Mitchell, Meredith B. **Hypnotizability and distractibility.** *American Journal of Clinical Hypnosis*, 1970 (Jul), Vol. 13(1), 35-45.—Results suggest that hypnotic susceptibility involves an ability which operates in the tracking situation to enable establishment of optimal sympathetic and psychomotor means for overriding effects of exposure to the irrelevant, unexpected stimuli. Evidence from a multiple choice questionnaire indicated that the susceptible S does not ignore distracting stimuli; instead he seems to render them ineffectual as interfering with goal achievement.—*M. V. Kline.*

130. Nuland, William & Field, Peter B. (42 Bretton Rd., Scarsdale, N.Y.) **Smoking and hypnosis: A systematic clinical approach.** *International Journal of Clinical & Experimental Hypnosis*, 1970 (Oct), Vol. 18(4), 290-306.—Compared 2 methods of helping cigarette smokers stop smoking using 181 patients. After 6 mo., 60% of those treated with an active, personalized approach were not smoking. This approach emphasized: (a) the feedback, under hypnosis, of the S's own reasons for quitting, (b) maintaining contact with the S by telephone, (c) use of meditation during hypnosis to obtain individualized motives, and (d) self-hypnosis. Only 25% of Ss were successfully treated by an earlier hypnotic procedure that did not systematically employ these features. (German & Spanish summaries)—*Journal abstract.*

131. Podolnick, Edward E. & Field, Peter B. (Youth Development Clinic, Newark, N.J.) **Emotional involve-**

ment, oral anxiety, and hypnosis. *International Journal of Clinical & Experimental Hypnosis*, 1970 (Jul), Vol. 18(3), 194-210.—48 undergraduates were randomly assigned to either a high or low emotional arousal manipulation and then underwent a tape-recorded hypnotic induction and test of depth. The high-arousal group was exposed to infantile oral objects and were led to believe that they would have to suck on them as part of a physiological psychology experiment in which the cutaneous sensitivity of the human mouth was being mapped. The low-arousal group believed they only had to blow on whistles or pipes. While both groups were anticipating these experiences, hypnosis was induced. Ss in the high-arousal group were significantly more hypnotizable ($p < .001$) than their counterparts in the low-arousal group. Ss in the high-arousal group were significantly less anxious after hypnosis than they were before hypnosis, while the low-arousal Ss did not show a reduction in anxiety. The groups did not differ on several background personality tests given as checks on the randomization. (Spanish & German summaries) (22 ref.)—*Journal abstract.*

132. Swiercinsky, Dennis & Coe, William C. (Fresno State Coll.) **Hypnosis, hypnotic responsiveness, and learning meaningful material.** *International Journal of Clinical & Experimental Hypnosis*, 1970 (Jul), Vol. 18(3), 217-222.—Compared 3 antecedent conditions for their ability to enhance recall of meaningful material. Ss were 35 male and 10 female upperclass undergraduates. The conditions were: (a) group hypnotic instruction followed by posthypnotic suggestions of enhanced concentration and recall ability, (b) task motivation instructions to Ss to imagine and try their best, and (c) no special instructions (control). No differences in recall ability were found. Also, high and low susceptible Ss performed essentially the same. (Spanish & German summaries)—*Journal abstract.*

MOTIVATION & EMOTION

134. Moon, W. Harold & Lair, Charles V. (Auburn U.) **Manifest anxiety, induced anxiety and digit symbol performance.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 947-950.—Divided 2 groups ($N = 144$) of female undergraduates into 3 subgroups with different drive levels according to scores on the Taylor MA scale. A group having viewed a stressful film showed a significant depression in Digit Symbol scores when compared with controls which observed a nonstressful film, regardless of MA scale scores. Also, differences in gain scores across pre- and posttest trials were noted, with moderate MA scale Ss showing significantly greater improvement regardless of stress condition. Interpretation of impaired Digit Symbol performance on the WAIS and the WISC as a response to situational stress is more conservative than predicting motivational levels based on a single 90-sec trial.—*Journal abstract.*

ATTENTION & EXPECTANCY & SET

135. Chase, Wendell D. (NASA, Ames Research

Center, Mountain View, Calif.) **Evaluation of several TV display system configurations for visual simulation of the landing approach.** *IEEE Transactions on Man-Machine Systems*, 1970 (Sep), Vol. MMS-11(3), 140-149.—Examines the effects of several variations of 2 types of visual display systems on subjective evaluations of 7 professional pilots and objective measures of performance in the landing approach. 2 types of flight approaches were made with either a projector or collimated monitor visual display: (a) the instrument approach, and (b) the visual approach without the normal cockpit instrumentation assistance. The variables examined were color, differences between displays due to collimation, and reduced resolution. Ss were more critical of the black and white variation for either display, and favored more use of a color system. Advantages cited for a color system included greater S relaxation, decreased fatigue, better picture quality, and more realistic depth perception, particularly with the monitor display. With regard to the reduced-resolution monitor display, Ss also noted a loss in depth perception and height references, increased visual fatigue, and increased efforts for a reasonable approach, in comparison with the projector display. The objective performance measures of the study were consistent with the Ss' subjective evaluations and comments.—*Journal abstract*.

136. Jones, E. C. & Schuster, D. H. (Iowa State U.) **Design and development of an adaptive, auditory, and distractive stressor.** *IEEE Transactions on Man-Machine Systems*, 1970 (Sep), Vol. MMS-11(3), 161-163.—Developed an auditory, distractive stressor that automatically adjusts its rate of presenting random digits to human Ss. The rate of digit presentation serves as an inverse index of the amount of attention S can spare from a primary task. The auditory pattern recognition of the device was evaluated under several speaking conditions and for a variety of human speakers. The distractive stressor has a satisfactory digit recognition accuracy, and adapts its digit presentation rate quickly according to how well an S repeats its given numbers.—*Journal abstract*.

LEARNING

146. Frankel, Fred; Levine, Marvin, & Karpf, David. (U. California, Irvine) **Human discrimination learning: A test of the blank-trials assumption.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 342-348.—M. Levine's (see PA, Vol. 40:5014) general hypothesis (H) model of discrimination learning consists of 3 assumptions: (a) on any trial, an adult human S holds an H which serves as a basis for responding on that trial; (b) when S receives a blank trial (i.e., a trial without feedback), the same H is held on the next trial; and (c) the H set is finite and is known to E. These assumptions were tested in 2 experiments with 32 and 48 undergraduates. A series of 30 consecutive blank trials (30-probes) was interposed once within 4-dimensional discrimination problems. Data which support these assumptions are: (a) with few exceptions, Ss showed an overwhelming tendency to respond on the basis of a single H throughout the 30-probe; and (b) with increasing degree of pretraining, the proportion of 30-probes showing a simple H increased, while the number of discrepancies in responding to a single H on these 30-probes decreased.—*Journal abstract*.

Conditioning

147. Conger, Judith C. & Conger, Anthony J. (U. Western Ontario, London, Canada) **Internal consistency of verbal response classes.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 777-778.—Questioned the traditional determination of adequacy of measurement in verbal conditioning studies. Reliance on the single

criterion of interrater reliability ignores other critical aspects, i.e., the internal consistency of response classes and problems intrinsic to derived scores. Illustrative data are presented in which interrater reliabilities are respectable but the typical significance test for experimental effects would be applied to a measure that contained little nonerror variance because of low internal consistency. In such a case, experimental effects could not be detected.—*Journal abstract.*

148. Dawson, Michael E. (Andrew Norman Research Center, Gateways Hosp., Los Angeles, Calif.) **Cognition and conditioning: Effects of masking the CS-UCS contingency on human GSR classical conditioning.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 389-396.—A discrimination classical conditioning paradigm was embedded in a masking task and presented to 75 undergraduates to attenuate learning of the CS-UCS contingency without affecting perception of the individual CSs. $\frac{1}{2}$ of the Ss were instructed about the CS-UCS contingency, while the other $\frac{1}{2}$ were not. Results were that instructed Ss conditioned, while the noninstructed Ss failed to condition. Results were confirmed whether the CS-UCS interval was 1 or 8 sec. and whether the number of trials was 30 or 60. These findings, in conjunction with other reports, suggest that the ability to verbalize the CS-UCS contingency is an important, perhaps even essential, variable in human GSR classical conditioning. (21 ref.)—*Journal abstract.*

149. Edwards, Joseph S. & Peek, Vickie. (U. Kansas, Medical Center, Bureau of Child Research) **Conjugate reinforcement of radio listening.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 787-790.—Used 4 conjugate contingencies to evaluate radio listening as a reinforcer for operant responding. Radio volume was a direct function of S's response rate. Results from 2 males, 13 and 26 yr. old, demonstrated that radio listening can be used to reinforce response rates. The method of directly recording the listening response was also sensitive to commercials.—*Journal abstract.*

150. Kennedy, John J. (Ohio State U.) **Response measure efficiency in verbal conditioning research.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 898.—Assessed the relative efficiency of 15 response measures (RMs) generated from a Taffel-type task. Frequency of self-reference response for each of 4 20-trial-blocks was obtained on 80 Ss who comprised 2 groups demonstrating conditioning and failure to condition. 1-way analyses of variance between groups, with associated eta coefficients, were calculated for each RM. Results suggest that selected RMs are not equally efficient.—*Author abstract.*

151. Vandament, William E. (State U. New York, Binghamton) **Generalization and the ISI in human eyelid conditioning.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 717-718.—Following 80 eyelid conditioning trials with a 400-, 600-, or 800-msec interstimulus interval (ISI), 60 undergraduates were given 20 extinction trials to a test stimulus, then shifted to the acquisition CS for 10 extinction trials. Generalized extinction was found negatively related to ISI with no systematic ISI trends observed for generalization of positive response tendencies.—*Journal abstract.*

Verbal Learning

152. Birnbaum, Isabel M. (U. California, School of Social Sciences, Irvine) **Response selection and**

retroactive inhibition. *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 406-410.—After a 12-pair list (A-B) had been learned, either 0, 2, or 4 of the 12 stimuli were omitted during single- (A-C) or double-list (A-C, A-D) interpolated learning (IL) for 120 undergraduates. On an unpaced test of List 1 recall, double-list IL produced the greatest amount of retroactive inhibition (RI). Total RI was significantly greater in the 12-pair IL groups than in the 8-pair IL groups. RI for specific List 1 pairs was not differentially influenced by the presence or absence of the stimulus member of the pair on the IL list(s). These results were obtained for both single and double interpolation with either 8-pair or 10-pair interpolated lists. Results support the hypothesis that specific components of interference do not contribute to RI in the A-B, A-C paradigm.—*Journal abstract.*

154. Dyer, Luann C. (U. California, Los Angeles) **The orienting reflex and semantic profile as predictors of semantic generalization.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5255-5256.

155. Hass, Wilbur A. & Doty, Dennis. (U. Chicago) **Change in the meaning of symbolic vehicle and referent as a result of word-object reference learning.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 53-60.—Investigated whether learning word-object pairs leads to changes in the learner's interpretation of the words or the objects or both. High school students rated nonsense words and nonsense objects on the semantic differential, learned 1 or another pairing of the words with the objects, and then rated them on the semantic differential again. The meanings of both the words and the objects converged toward the other member of the pair, although a greater effect was noted for the words than for the objects. The findings generally support Werner and Kaplan's view of symbol formation, but are also compatible with a view that there is simultaneous conditioning of mediators to both verbal and nonverbal items in reference learning.—*Author abstract.*

156. Hersen, Michel. (Fairfield Hills Hosp., Newtown, Conn.) **Controlling verbal behavior via classical and operant conditioning.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 3-22.—Surveyed the manipulation of verbal behavior in terms of the mediational framework, the concept-formation approach, attitude acquisition, and operant conditioning. Selected verbal operant conditioning experiments are reviewed with special attention directed towards the range of differences, limitations, and advantages of each type of paradigm employed. The nonlinearity of the control-compliance relationship is stressed and suggestions for further research are made. (77 ref.)—*Author abstract.*

157. Howe, Edmund S. (U. Missouri, St. Louis) **Transformation, associative uncertainty, and free recall of sentences.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 425-431.—8 sentences, each under a different transformation condition, were learned by 8 groups of 10 undergraduates each given different sentence \times transformation pairing. Free recall followed each of 16 presentations of a list. It was conjectured that learning of transformation conditions and learning of sentence contents should not interact. The conjecture was supported for total correct

recall data. However, while intralist intrusion errors were independent of transformation condition, transformation errors were partly a function of sentence content. The possibility is raised that syntactic and semantic errors are not wholly independent. While learning rate and number of intralist intrusion errors for the sentences were predictable from their free-associative uncertainty values, transformation errors were not.—*Journal abstract.*

158. Miller, Adam & Hood, Randolph. (St. Cloud State Coll.) **Awareness, social deprivation and verbal operant conditioning for adults.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 893-894.—In a $2 \times 2 \times 5$ factorial design the effects of social deprivation and reinforcement upon Taffel sentence construction were studied for 40 adults. Only reinforced Ss conditioned, and of them both aware and unaware Ss conditioned. Social deprivation did not affect conditioning or awareness.—*Journal abstract.*

159. Miller, Adam W. & Rumans, Jane. (St. Cloud State Coll.) **Taffel and Greenspoon: Comparative effects of obviousness of reinforcement and response structure.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 43-51.—Compared the Taffel and Greenspoon procedures for verbal operant conditioning in terms of effects from obviousness of reinforcement and response structure upon learning, awareness, and their relationship. For each procedure $1-2 \times 3$ factorial design was for learning and another for awareness. 10 undergraduates were used for each of the 12 groups. For each procedure obviousness of reinforcement was varied on 2 levels and response structure on 3 levels. Comparing the 2 procedures, obviousness of reinforcement had more pronounced effects on learning for Taffel, had similar effects on awareness for both procedures, and provided a more consistent relationship between awareness and learning for Taffel. Response structure had no significant effects.—*Journal summary.*

160. Palermo, David S. & Howe, Herbert E. (Pennsylvania State U.) **An experimental analogy to the learning of past tense inflection rules.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 410-416.—24 undergraduates learned 3 single-letter responses to 2-digit stimuli. The letter response was contingent upon the environment specified by the 2nd digit. 4 exceptions to the rule required different letter responses. Results indicate that 2 different strategies were employed and the resulting performance followed the pattern observed in the acquisition of past tense inflection by young children. The irregular forms were acquired 1st, by rote learning, and the rule-governed responses 2nd. Once the 2nd strategy was employed the rule was applied to the exceptions, and overgeneralization errors to the irregular forms occurred. Rate of acquisition of the irregular forms was positively related to frequency of presentation, and overgeneralization errors were inversely related to frequency of presentation.—*Journal abstract.*

161. Paul, Coleman; Hoffman, Charles D., & Dick, Stuart. (Adelphi U.) **Acquired (conditional) equivalence: A basis for response-set effects in verbal-discrimination reversal performance.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 361-367.—Reports 2 experiments on a 50% reversal shift. In Exp. I with 36 undergraduates, reversed and nonreversed pairs were discriminatively color coded during transfer, so that word-pair color could identify shift status (reversed-nonreversed) of each pair. In Exp. II with 48

Ss, reversed and nonreversed pairs were respective members of experimentally established equivalence classes; the equivalence mediator (label) could identify shift status of each pair. Results support a conditional equivalence analysis of verbal-discrimination shift tasks.—*Journal abstract.*

162. Trumbo, Don & Noble, Merrill. (Pennsylvania State U.) **Secondary task effects on serial verbal learning.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 418-424.—On the basis of prior studies involving pursuit tracking, it was predicted that performance of 60 right-handed male undergraduates in a serial verbal learning of CVC lists would be interfered with when a 2nd overlapping task required response-selection decisions. The hypothesis was confirmed using a 2×5 design with 2 CVC lists and 5 secondary task conditions. While tasks requiring the selection of anticipatory responses or responses in random sequences resulted in decrements in primary task performance, tasks requiring response execution or signal processing without overt responding produced no interference. Results are discussed in terms of a 4-stage information-processing model wherein the response-selection stage is seen as an important limitation on dual-task performance.—*Journal abstract.*

Verbal Paired Associate Learning

163. Hatano, Giyoo & Kuhara, Keiko. (Dokkyo U., Japan) [Experimental studies of meaningful learning: I. Effectiveness of meaningful learning.] *Japanese Journal of Psychology*, 1969 (Oct), Vol. 40(4), 192-200.—Defines the process of meaningful learning as identifying equivalence between incoming and stored information, by transforming the former. An experiment of successive paired-associate learning was conducted to compare the learning performance between 2 conditions of preceding learning. Although Ss of both conditions learned the same list, in 1 condition Ss could learn it meaningfully, by displacing components in the response term (using preceding associations) and integrating them by connectives; in the other condition, Ss could not find equivalence by such transformation and had to learn the list by rote. Results indicate that the effectiveness of meaningful learning was clearly shown.—*English abstract.*

165. Johnson, Ronald E. (Purdue U.) **Differential availability of associative components in rehearsal.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 356-360.—After attaining a 7:12 criterion on 1 of 2 types of paired-associate lists, 88, 80, and 160 undergraduates in 3 experiments rehearsed for 5 min. and 24 sec. and then attempted recall on 5 postrehearsal trials. During rehearsal, Ss were allowed access to random listings of either the stimuli, the responses, or both the stimuli and responses. Antirehearsal groups engaged in reading. Generally, the availability of stimuli in rehearsal was more critical than the availability of responses. However, the meaningfulness of the available components was not a determinant of rehearsal effectiveness. The patterning of results supports the thesis that the effectiveness of rehearsal depends upon the similarity

of the rehearsal activity to the learning and criterion tasks.—*Journal abstract.*

166. Paivio, Allan & Foth, Dennis. (U. Western Ontario, London, Canada) **Imaginal and verbal mediators and noun concreteness in paired-associate learning: The elusive interaction.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 384-390.—40 undergraduates generated mediators for 30 concrete or 30 abstract noun pairs, in each case $\frac{1}{2}$ the pairs were linked by nonverbal images and $\frac{1}{2}$ by verbal mediators. The novel feature of the procedure was that the Ss explicitly produced the respective mediators by drawing the image and writing the phrase or sentence. A subsequent paired-associate recall test revealed an interaction such that imagery produced better recall than did verbal mediation in the case of concrete pairs whereas the reverse occurred with abstract pairs, as predicted from a 2-process theory of meaning and mediation. 2 further experiments confirmed these findings and supported the theory.—*Journal abstract.*

168. Richardson, John T. (St. John's Coll., Oxford, England) **Verbal learning: Incremental vs. all-or-none theory.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 196-204.—Compared the incremental and all-or-none theories of verbal learning by means of a little-used variation of the "drop-out" paradigm with paired associates using 16 undergraduates as Ss. Earlier experiments purporting to be relevant to the controversy were rejected as failing to offer a conclusive distinction between the 2 theories. Results support the incremental theory. It is suggested that irregularities in the results of this and other experiments are caused by several intrusive factors, and a "dual-factor" hypothesis which was put forward to account for these irregularities is questioned on logical and methodological grounds. (23 ref.)—*Journal abstract.*

169. Wichawut, Chalyaporn & Martin, Edwin. (U. Michigan, Human Performance Center) **Selective stimulus encoding and overlearning in paired-associate learning.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 383-388.—Studied the nature of stimulus cue selection and inclusion using a paired-associate list of 3-word stimuli and 1-word responses, together with a stimulated recall test. Results from 3 groups of 32 Ss each show that: (a) the number of selected cues increased with increasing degree of learning; (b) the effect of cue position was differential for different Ss; and (c) there was dependence among cues recalled, as well as between cues and responses recalled. It is concluded that stimulus cues are selected on a spatially determined attentional basis and that these cues are associated with the responses independently in a parallel fashion. (17 ref.)—*Journal abstract.*

Reinforcement

170. McGinley, Hugh. (U. Manitoba, Winnipeg, Canada) **The development of a conditioned reinforcer through direct and vicarious reinforcement.** *Journal of Experimental Social Psychology*, 1970 (Jul), Vol. 6(3), 364-377.—Task learning Ss received response contingent reinforcement which followed either a red or a blue light by about 3 sec. Os watched the task Ss. Some Os merely observed the task S, others observed but

received reinforcements which depended upon the task S's responses. Conditioning was measured by S's preference for the color associated with reinforcement. Under similar conditions, task Ss showed conditioning while Os did not. 96 female undergraduates served as Os and Ss. Results suggest that the difference of conditioning in the 2 conditions may be interpreted as a difference in S involvement. (31 ref.)—*Journal abstract.*

171. Miller, Adam & Swan, John. (St. Cloud State Coll.) **Effects of four reinforcement schedules on the generalization gradient.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 828-830.—Compared the relative effects of 4 reinforcement schedules and a random control upon the gradient of generalization for 25 undergraduate volunteers. During color discrimination learning, ratios and intervals were selected to equalize response rates among schedules and overlearning established equal response latencies among schedules. Different schedules did not produce significantly different gradients.—*Journal abstract.*

172. Spence, Janet T. (U. Texas) **Verbal reinforcement combinations and concept-identification learning: The role of nonreinforcement.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 321-329.—Tested the hypothesis that the poorer performance on concept-identification tasks produced by a right-blank (rb) reinforcement combination than by wrong-blank (wb) is due to the tendency of some rb Ss to treat blank as signaling correct responses. Ss were 40 undergraduates. Observational learning problems were devised in which the solutions reached by members of wb and rb groups differed according to the informational characteristics, r or w, S attributed to blank. Wb Ss tended strongly to reach b = r solutions and were indistinguishable in performance from right-wrong Ss. Of 20 rb Ss, 9 consistently gave b = r solutions, 3 consistently gave b = w solutions, and 8 tended to vary in type of solution across problems.—*Journal abstract.*

MEMORY

173. Bobrow, Samuel A. (U. Washington) **Memory for words in sentences.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 363-372.—Presented noun pairs as the subject and object nouns of sentences. In Exp. I with 18 undergraduates noun pairs were repeated in 1 of 3 ways: (a) exact sentence repetition, (b) change in adjective and verbs which did not alter noun meanings, or (c) change in adjectives and verb which biased different noun meanings. In a cued-recall test, it was found that Conditions 1 and 2 resulted in equal recall, but Condition 3 recall was lower than the other conditions, supporting the hypothesis that semantic information about words is remembered. Exp. II with 36 undergraduates explored whether categorical or distinctive information about words is remembered.—*Journal abstract.*

174. Cornish, Elizabeth R. & Wason, P. C. (West Ham Coll. of Technology, London, England) **The recall of affirmative and negative sentences in an incidental learning task.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 109-114.—Presented positive and negative clues (N = 16) describing a nonexistent object to 40 Ss who identified the object and listed as many clues as they could recall. A significantly greater number of affirmative than negative clues were correctly recalled. The majority of errors were conver-

sions from negative to affirmative, independent of meaning. The difficulty associated with negative clues was attributed to the fact that they appeared inappropriate because there was no prior established condition for them to negate.—*Journal abstract.*

175. **Gumenik, William E. & Slak, Stefan.** (U. Toledo) **Denotative meaning isolation effect in multitrial free recall.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 434-435.—In a multitrial free recall task with fixed stimulus presentation order, isolating an item by embedding it in a list of items of a different superordinate category improved performance on that item. Isolation of an item did not affect performance on the nonisolated items on the list. 96 undergraduates served as Ss.—*Journal abstract.*

176. **Holding, Dennis H.** (U. Louisville) **Guessing behaviour and the Sperling store.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 248-256.—Measured recall of briefly exposed letters by whole and partial report procedures with 12 undergraduates. The cues for partial report were presented in advance, or in random, constrained or nonrandom sequences. The degree of statistical constraint determined S accuracy in guessing the cues. Results indicate that the amount of letter recall is largely dependent upon both sequential and spatial guessing accuracy. It is suggested that the data are adequately explained by cue anticipation with the visual storage hypothesis receiving no support.—*Journal abstract.*

177. **Howell, David C.** (U. Vermont) **Free association reliability as a function of response strength.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 431-433.—Investigated the reliability of the free association process over a 3-mo interval. 44 undergraduates free associated to the same 45 stimulus words on 3 separate sessions, separated by 1-mo intervals. Data demonstrate that the probability of repeating a response from 1 session to another is a function of the normative strength of that response. Instructing Ss to either free associate on subsequent sessions or to repeat their original responses did not have any important effect on the data. It is concluded that free association norms reflect individual response hierarchies moderately well.—*Journal abstract.*

178. **Jahnke, John C.** (Miami U.) **Probed recall of strings that contain repeated elements.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 450-455.—Examined the relation of intraserial repetition to memory under each of 4 conditions of probed recall where either the item or the pair of items preceding a target item, the item succeeding the target item, or the serial position of the target item were chosen as probes. Stimuli were 7-consonant strings, $\frac{1}{2}$ of which contained no repeated letters and $\frac{1}{2}$, a single repetition of a single letter. 80 female undergraduates served as Ss. In no instance was the recall of repeated letters significantly poorer than that of corresponding control letters. The failure to observe a Ranschburg effect (RE) supported the notion that the RE depends in part on the contribution of output interference.—*Journal abstract.*

179. **Kintsch, Walter.** (U. Colorado) **Recognition memory in bilingual subjects.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 405-409.—Gave 19 bilingual adults a continuous recognition memory test. All items were English or German nouns and were repeated twice, either in the same language or with a language change. Group I identified

each item as either new, repeated in the same language, or repeated in the other language. In Group II, Ss responded Yes only if an item was repeated in the same language, while in Group III, yes responses were given even when items were repeated with a language change. Results show that Ss could respond either on the basis of language-specific or general semantic cues. However, certain interference effects indicate that the 2 sets of cues were not independent.—*Journal abstract.*

180. **Klein, Gary A.** (U. Pittsburgh) **Stimulus representation in memory.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5259.

181. **Klein, Leslie S. & Arbuckle, Tannis Y.** (U. Manitoba, Ft. Garry, Canada) **Response latency and task difficulty in recognition memory.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 467-472.—Examined changes in response latency under conditions where task difficulty was varied by manipulating length of retention interval and formal similarity of test alternatives. The task was to select a previously shown CVC from 5 alternatives having 0-2 letters in common. Retention interval was varied by having S count backwards for 3.75 sec. from each of 0-5 successively presented 3-digit numbers. 84 undergraduates were each tested on all 42 combinations of 6 retention intervals and 7 degrees of similarity. Results indicate that correct recognitions decreased and latencies of correct recognitions increased with increasing length of retention interval and degrees of similarity. Data are discussed in terms of available information and search and decision processes. (19 ref.)—*Journal abstract.*

182. **Lachman, Roy & Mistler, Janet L.** (State U. New York, Buffalo) **Rehearsal, test trials, and component processes in free recall.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 374-382.—Exp. I investigated the improvement in free recall in 192 female undergraduates due to interpolated test trials. Rehearsal instructions and rehearsal prevention were varied independently of presence or absence of interpolated test trials. Overt recall was equivalent to covert rehearsal in influencing terminal recall, suggesting the operation of identical component processes. Exp. II with 200 female Ss attempted to conceptually identify and experimentally isolate 3 such component processes: implicit item generation, implicit item editing, and physical response. These were simulated in various combinations by the 5 treatments of Exp. II: test trial, with all 3 components present; physical response, with only the overt response; editing, with a simulation of item editing; rehearsal, with assumed generation and editing; and nonrehearsal, with 0 components present. Overall recall levels were: rehearsal = test trial > physical response = nonrehearsal > editing. Subject to explicitly stated assumptions, it is concluded that subsequent level of recall is raised by activation of the item generating system, unaffected by occurrence of the physical response, and reduced by activation of the editing mechanism. (17 ref.)—*Journal abstract.*

183. **Lesgold, Alan M. & Bower, Gordon H.** (Stanford U.) **Inefficiency of serial knowledge for associative responding.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 456-466.—Examined organization of serial memory. 36 adults learned a serial list chunked into triplets, then learned a paired associate (PA) task in which the pairs were consecutive items from the original series. Ss who were informed of the relationship between the tasks gave PA error patterns

that corresponded more closely to the transition-shift probabilities of the serial task than did the PA error patterns of uninformed Ss. Further, the informed Ss showed positive transfer on early PA trials but negative transfer on the later trials, with overall learning rates averaging $1/2-1/3$ of those of control Ss. The effects of the instructions show that (a) Ss have multiple PA strategies available, and (b) serial-recall memory may not always include direct links between consecutive items. (22 ref.)—*Journal abstract.*

184. Martin, David W. (New Mexico State U.) **Residual processing capacity during verbal organization in memory.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 391-397.—Used continuous compensatory tracking performed concurrently with a verbal memory task to monitor the information-processing demands of memory in 14 male undergraduate and graduate students. Tracking performance within 2 temporally defined memory stages reflected processing demands as the following variables were investigated: blocked vs. nonblocked presentation, association strength to a category, and number of list presentations. These variables were manipulated to isolate the memory stage in which organization occurs. Adding a memory task to the tracking task caused a consistent decrement in tracking performance. More processing was required for retrieval from memory than for encoding. Finally, retrieval of the blocked lists required less processing on succeeding trials, whereas retrieval of nonblocked lists required equal amounts of processing over trials. (19 ref.)—*Journal abstract.*

185. Matthews, W. A. & Manasse, K. (U. Southampton, England) **Associative factors in free recall.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 177-184.—Varied associative frequency, word frequency and the number, and therefore size, of the presented groups of 18-word lists. Recall efficiency was positively related to increasing associative frequency and larger presented group size. 24 college students served as Ss. Measures of clustering were obtained along with Ss' own reports of the associative labels helpful in organizing their recall. A 2-level storage model is proposed to account for results.—*Journal abstract.*

186. Nelson, Douglas L., Garland, Richard M., & Crank, Donald. (U. South Florida) **Free recall as a function of meaningfulness, formal similarity, form and amount of internal structure, and locus of contingency.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 417-424.—Determined the effects of meaningfulness and various conditions and levels of formal similarity on free recall acquisition, and identified processes involved in stimulus encoding under these treatments. 192 undergraduates served as Ss. Variations under conditions of high similarity included form and amount of internal structure, and locus of pairwise contingency. When stimulus sets were words, high similarity impaired recall, the extent of impairment depending upon the nature of the contingency. When stimuli were nonsense syllables, high similarity facilitated recall, with the exception that an interaction contingency significantly impaired acquisition. Both form and amount of structure affected performance to a greater extent under conditions of low than of high meaningfulness. (18 ref.)—*Journal abstract.*

187. Petrov, Y. I. (Inst. of Research in General Adult Education, Leningrad, USSR) **O strukture pamyati kak psikhicheskoi funktsii.** [Memory structure as a psychic

function.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 132-136.—Factor analysis of 14 measures of memory yielded 4 factors: verbal memory, iconic memory, long-term retention of verbal materials, and a bipolar factor of short-term fixation of visual images.—*L. Zusne.*

188. Postman, Leo. (U. California, Inst. of Human Learning, Berkeley) **Effects of word frequency on acquisition and retention under conditions of free-recall learning.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 185-195.—Compared 3 levels of frequency—high (HF), medium (MF), and low (LF). 24 undergraduates in each of 6 groups served as Ss. Original learning consisted of 4 study-test cycles. A retention test was given either 30 sec. or 7 days after original learning and was followed by 3 relearning cycles. List HF was learned and retained better than lists MF and LF. The latter 2 did not differ. Degrees of sequential organization in original learning increased with word frequency, as did the persistence on the tests of retention of the output orders which had occurred at the end of acquisition. For Ss learning a given type of list there was little relation between degree of sequential ordering and amount of recall. (20 ref.)—*Journal abstract.*

189. Rundle, Sarah A. (U. California, Los Angeles) **An experimental and theoretical study of recognition memory.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5265.

190. Sampson, Jeffrey R. (U. Alberta, Edmonton, Canada) **Free recall of verbal and non-verbal stimuli.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 215-221.—In 2 experiments, 40 and 72 male undergraduates viewed 24 items, $1/2$ as words and $1/2$ as drawings. In Exp. I, all Ss were given a learning set and free recall was tested immediately after stimulus presentation and 30 min. later. In Exp. II, $1/2$ the Ss were set and recall was tested immediately and/or 1 day later. Picture recall was superior to word recall in all conditions ($p < .005$). Major extensions to previous procedures involved incidental learning, mixed stimulus lists, nonverbal reporting of pictures and delayed recall. A double-encoding explanation for the superior non-verbal performance is discussed.—*Journal abstract.*

192. Shallice, T. & Warrington, Elizabeth K. (University Coll., London, England) **Independent functioning of verbal memory stores: A neuropsychological study.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 261-273.—Describes 5 experiments concerning verbal short-term memory (STM) performance of a patient with a markedly reduced verbal span. Results of the 1st 3, free recall, the Peterson procedure, and an investigation of proactive interference, indicate that S has a greatly reduced STM capacity, while the last 2, probe recognition and missing scan, show that this cannot be attributed to a retrieval failure. Since S's performance on long-term memory (LTM) tasks was normal, it is difficult to explain these results with theories of normal functioning in which verbal STM and LTM use the same structures in different ways. They also make the serial model of the relation between STM and LTM less plausible and support a model in which verbal STM and LTM have parallel inputs. (42 ref.)—*Journal abstract.*

193. Stelmach, George E. & Wilson, Mark. (U.

California, Santa Barbara) **Kinesthetic retention, movement extent, and information processing.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 425-430.—Using a lever response, kinesthetic recall of various movement lengths was studied under 3 retention interval conditions: immediate recall, 20-sec rest, and 20 sec. of information reduction activity (1.82 bits). 16 undergraduates served as Ss. The information reduction condition required S to accurately displace the lever to mimic and add pairs of angles. Increased absolute error was found in both delayed recall conditions. The information reduction condition was significantly larger than 20-sec rest. However, the main effect of conditions for constant error was not significant. Systematic undershooting characterized the recall responses. Inspection of the absolute error as a function of the movement length revealed a Movement Distance \times Information Reduction Activity interaction. The effect of occupying S's processing capacity was interpreted as making his responses more variable.—*Journal abstract*.

194. Straus, Erwin W. & Griffith, Richard M. (Eds.) **Phenomenology of memory: The Third Lexington Conference on Pure and Applied Phenomenology.** Pittsburgh, Pa.: Duquesne U. Press, 1970. xiv, 205 p. \$6.95.

Short Term & Immediate Memory

195. Holding, Dennis H. (U. Louisville) **Digit size in short-term memory.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 257-260.—During an experiment requiring the recall of 7-digit sequences it was noted that errors appeared more likely in lists composed of the larger digits. Ss were 18 undergraduates. Subsequent analysis confirmed that, with immediate recall, there was a significant association between error frequency and mean digit size. When recall was delayed by an unfilled 6-sec interval, the effect was abolished. It is suggested that interfering with rehearsal by interpolating a task of motor memory may reinstate the effect.—*Journal abstract*.

196. Morton, John & Holloway, C. M. (Medical Research Council, Applied Psychology Unit, Cambridge, England) **Absence of a cross-modal "suffix effect" in short-term memory.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 167-176.—Reported 3 experiments involving the presentation of lists of either letters or digits for immediate serial recall with 80 Ss. The main variable was the presence or absence of a suffix-prefix, tick or cross, occurring at the end of the list which had to be copied before recall of the stimulus list. With auditory stimuli and an auditory suffix-prefix there was a large and selective increase in the number of errors on the last few serial positions—the "suffix effect". The effect was not found with auditory stimuli and a visual suffix-prefix nor with a visual stimulus and an auditory suffix-prefix. Results are interpreted as supporting a model for short-term memory proposed by R. G. Crowder and J. Morton (see PA, Vol. 43:15225) in which it is suggested that with serial recall information concerning the final items following auditory presentation has a different, precategorical, origin from that concerning other items. (16 ref.)—*Journal abstract*.

197. Pinkus, Allen L. & Laughery, Kenneth R. (Carnegie-Mellon U.) **Recoding and grouping processes in short-term memory: Effects of subject-paced presentation.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 335-341.—Measured time requirements of recoding and grouping processes by allowing 9 undergraduates to pace the presentation of 12-letter lists arranged into 4 groups of words, CVCs, abbreviations, or random letters. Results indicate that Ss take less time on lists for which a recoding strategy is appropriate than on lists for which only grouping rules apply. Performance comparisons with constant-paced studies indicate that retention is superior for the S-paced procedure when total time is equated. The proper allocation of time, and not simply total time, appears to be the crucial factor for improving retention.—*Journal abstract*.

198. Smith, Edward E. & Nielsen, Gerald D. (Stanford U.) **Representations and retrieval processes in short-term memory: Recognition and recall of faces.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 397-405.—Combined recognition and probe recall tasks with 3 retention intervals, 1, 4, and 10 sec., to study 144 undergraduates' memory for faces. In recognition, Ss decided whether a test face was the same as or different from a previously presented original. In recall, Ss indicated the size of a probed-for feature (e.g., eyes) of a previously presented original face. The number of features relevant to S's memory decision, r , was varied in both tasks and RT was the dependent measure. In recognition, same RT increased with r only at the longer retention intervals while different RT decreased with the number of features that differed between test and original at all retention intervals, suggesting that different retrieval processes underlied same and different judgments. Recall RT increased with r but was unaffected by retention interval, suggesting that retrieval in recall was from a verbal representation. (21 ref.)—*Journal abstract*.

199. Tulving, Endel. (U. Toronto, Ontario, Canada) **Retrograde amnesia in free recall.** *Science*, 1969 (Apr), Vol. 164(3875), 88-90.—Describes 2 experiments with 40 university and 20 high school students, respectively, using a new method of demonstrating a phenomenon that resembles retrograde amnesia. The basic experimental paradigm was that of a single-trial free recall. It was found that supervention of high-priority events in a series of events constituting a free-recall task interferes with postexposure processing of mnemonic information about immediately preceding events, with the result that recall of these preceding events is impaired. Recall of immediately following events is not affected. This retrograde interference is time dependent.—*Journal abstract*.

200. Turvey, M. T., Brick, P., & Osborn, J. (U. Connecticut) **Proactive interference in short-term memory as a function of prior-item retention interval.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 142-147.—Examined the effect of prior-item retention interval on the retention of a given item in 5 short-term memory tests with 5 conditions each. Retention intervals for Tests 1-4 were constant for a condition but varied across conditions. These retention intervals were 5, 10, 15, 20 and 25 sec. In Test 5 the retention interval was 15 sec. for all 5 conditions. 5 consonant trigrams constructed from the set of letters sharing the vowel sound "e" were used for all conditions. Recall on Test 5 was a direct function of prior-item retention interval. Data indicate that the availability of prior items for proactive interference is an inverse function of prior-item retention interval.—*Journal abstract*.

201. Turvey, M. T. & Fertig, Joanne. (U. Connecticut) **Polarity on the semantic differential and release from proactive interference in short-term memory.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 439-443.—Used word triads rated on the semantic differential as the to-be-remembered items in 3 successive short-term memory tests with 108 undergraduates. The dimension of the semantic differential from which a triad was drawn varied on each of the 3 tests. In the control condition, polarity was held constant across the tests, and in the experimental condition, the polarity of the triad on the 3rd test differed from the polarity of the triads on the preceding 2 tests. A release from proactive interference was observed with change in polarity and proactive interference was observed to develop across the evaluative, activity, and potency dimensions of the semantic differential when polarity was held constant.—*Journal abstract*.

THINKING

202. Brooks, Lee R. (McMaster U., Hamilton, Ontario, Canada) **An extension of the conflict between visualization and reading.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 91-96.—Gave 10 undergraduate and graduate students sentences which described a set of spatial relations. After the spatial layout described by a given sentence had been deduced, Ss either read or listened to a final presentation of this same sentence. It was found that the modality of this presentation influenced the speed with which Ss performed a subsequent mental transformation of the spatial relations. The transformation was completed more slowly immediately after reading the sentence than after listening to it. Results confirm Ss' reports that visualization of the spatial relations is interrupted by reading the sentence, but not by listening to it. The relation between the visual and the analogical aspects of visualization is briefly discussed.—*Journal abstract*.

203. Collins, Allan M. & Quillian, M. Ross. (Bolt Beranek & Newman, Cambridge, Mass.) **Does category size affect categorization time?** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 432-438.—Conducted 2 experiments with 12 and 6 adult Ss. I a partial replication of an experiment by T. K. Landauer and J. L. Freedman (see PA, Vol. 43:1987) to disentangle 2 possible explanations for the fact that it takes longer to categorize object names into larger categories than into smaller categories. Several factors were found to affect categorization time: nesting, whether or not subcategories were utilized by Ss in the categorization task, and semantic relatedness or confusability. There was no evidence that larger categories, in and of themselves, required longer categorization times than smaller categories.—*Journal abstract*.

205. Guilford, J. P., Fulgosi, Ante, & Hoepfner, Ralph. (U. Southern California) **A multivariate analysis of some controlled-association tasks.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 119-134.—4 pairs of controlled-association tasks were factor analyzed in order to determine what psychological functions they represent. Special interest was in the extent to which they involve divergent- vs. convergent-production abilities,

and the products of units, vs. relations, vs. classes of the structure-of-intellect model. The tasks were found to represent 2 semantic-cognition abilities for units and classes, and 4 production abilities for units and relations. Implications for understanding problem solving are suggested. The same procedure could lead to a taxonomy of intellectual tasks, including those used in the psychological laboratory.—*Author abstract*.

206. Helvey, T. Charles & Charles T. (U. Tennessee) **Cybernetic aspects of symbol processing in man.** *Acta Symbolica*, 1970 (Spr), Vol. 1(1), 53-56.—Discusses the computerizable aspects of symbol processing in man and the possibility of developing an amplifier for human intelligence. Artificial intelligence which can reproduce the symbol acquisition and manipulation of man insofar as primary interpretation is concerned seems feasible. The major barrier is posed by the secondary interpretations, involving the interaction of formed symbols with the emotional milieu.—*M. Cynamon*.

207. Roby, Thornton B. & Lyons, Teresa. (Tufts U.) **Use of state and transitional information.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 329-336.—Investigated relative human ability to digest information describing the state of the environment (σ) or state transitions (τ). The task required the summing or differencing of symbolically presented σ or τ information items. In Exp. I undergraduates were presented σ or τ information in mixed order and σ or τ queries at variable intervals. Exp. II entailed uniform translation from σ to τ or τ to σ modes. Results show that: (a) acquisition across modes— τ - σ or σ - τ —is more difficult than within mode acquisition; (b) τ - σ acquisition is superior to σ - τ acquisition; (c) both number of elements and number of phases or levels within elements add to task difficulty; and (d) the relative advantage of σ over τ acquisition decreases with an increasing number of presented items. Results are explained in part by the comparative economy of state information storage for normal decision making tasks.—*Journal abstract*.

213. Posner, Michael I. (U. Oregon) **On the relationship between letter names and superordinate categories.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 279-287.—Explored the sequence of processing steps in obtaining the classifications vowel-consonant and letter-digit using 32 undergraduates. The procedure involved measuring the RT to classify pairs of stimuli as same. Inferences were drawn from RTs to letters with the same name and from other differences between the RT structures obtained in the 2 classifications. When same was defined as both vowels or both consonants Ss seemed to determine the letter name and then classify the name into its superordinate category. When same was defined as both letters or both digits Ss appeared to classify the visual form directly into 1 of the 2 superordinate classes without 1st obtaining the name. The most likely explanation for the difference between conditions is the nature of training which Ss have had while learning the classifications.—*Journal abstract*.

216. Gabriel, M. & Ball, T. S. (U. California, Irvine) **Plethysmographic and GSR responses to single versus double-simultaneous novel tactile stimuli.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 368-373.—Following 9 tactile stimulations of 1 of 4 fingertips of 48 18-35 yr. old Ss, GSR and finger-plethysmograph (FPR) orientation responses (ORs) were observed at 3 novel fingertips. OR stimuli were either single stimulations (SSs) of the novel fingertip, or simultaneous stimulations of novel and original fingertips (DSSs). Trials of habituation to the original fingertip were interspersed among the test trials. The FPR data suggest that DSS is a more effective OR-producing stimulus than SS, and that OR magnitude is inversely related to proximity of habituation and test fingertips. The GSR showed reduction of the OR for some pairs of adjacent (highly proximate) habituation and test fingertips. This reduction depended upon an interaction of the stimulus factor with relative position of habituation and test loci. Even under adjacent conditions, ample GSR-ORs occurred when either the habituation or test fingertip had high localizability.—*Journal abstract*.

Chicago) **Hydroxyindole-O-methyl-transferase activity: Effect of sympathetic nerve stimulation.** *Science*, 1968 (Oct), Vol. 162(3851), 367-368.—Stimulation of the preganglionic nerve trunk to the superior cervical ganglion causes a reduction in pineal hydroxyindole-O-methyl-transferase levels which is time-dependent. Results provide direct evidence for a role of afferent input in the control of pineal enzymatic activity.—*Journal abstract*.

221. Collins, Robert L. & Fuller, John L. (Jackson Lab., Bar Harbor, Me.) **Audogenic seizure prone (ASP): A gene affecting behavior in linkage group VIII of the mouse.** *Science*, 1968 (Dec), Vol. 162(3858), 1137-1139.—Conducted an experiment using 940 C57BL/6J and DBA/2J mice as Ss. The incidence of initial audiogenic seizures in Ss from crosses between a susceptible and a resistant inbred strain is attributable to the effects of a single pair of alleles. The locus responsible for this behavioral variation is located in Linkage Group VIII of the mouse. Sensitization-dependent convulsions are influenced in whole or in part by alleles at an independent locus.—*Journal abstract*.

222. Corning, W. C. & Freed, Simon. (Fordham U., Animal Behavior Lab.) **Planarian behaviour and biochemistry.** *Nature*, 1968 (Sep), Vol. 219(5160), 1227-1229.—Analyses of nucleic acids from planarians removed at various stages of conditioning showed that the RNA/DNA specific activity ratios were significantly different in trained Ss during the middle stages of training when learning was not pronounced. The ratios

were, however, similar at the terminal stage when the conditioned response performance was high.—*Journal abstract.*

223. Deshcherevskii, V. I. (Inst. of Biological Physics, Pushchino, USSR) *Teoriya sokrashcheniya myshts.* [Theory of muscular contraction.] *Biofizika*, 1970 (Jan), Vol. 15(1), 53-61.—The kinetic theory of contraction for striped muscles, developed earlier for vertebrate skeletal muscles, is capable of accounting for the autooscillatory contractions of the flight muscles of several insects (asynchronous muscles, having the capacity to produce several contractions in response to a single stimulation—a capacity possessed also by glycerinated fibers), if the special features of their structural organization are considered. The theory yields a reasonable quantitative agreement with the experimental data. A large number of facts are explained for the 1st time within the frame of the kinetic model employed. The invariance of the "molecular parameters" of the model, on extrapolation from vertebrate skeletal muscles to insect flight muscles, is evidence of the "unity of their elementary contractile mechanisms."—*I. D. London.*

224. Fuller, John L. & Collings, Robert L. (Jackson Lab., Bar Harbor, Me.) *Mice unilaterally sensitized for audiogenic seizures.* *Science*, 1968 (Dec), Vol. 162(3859), 1295.—To test the possibility that the site of sensitization may be relatively localized, possibly in the ear itself, strain SJL/J mice were exposed to loud bell-ringing (primed) with 1 ear blocked. Ss did not convulse, but were susceptible to audiogenic seizures 48 hr. later when stimulated only through the ear open at priming. S stimulated through the ear blocked at priming did not convulse, but were convulsible when retested on the opposite ear. The site of sensitization appears to be either in the ear or in those portions of the auditory system receiving input only from 1 side.—*Journal abstract.*

M. *Vliyanie razobshchitelei oksilitel'nogo fosforilirovaniya na vykhod atsetilkholina.* [Influence of the uncouplers of oxidative phosphorylation on the release of acetylcholine.] *Biofizika*, 1970 (Jan), Vol. 15(1), 76-83.—Studied the influence of different uncouplers of oxidative phosphorylation on the parameters of the miniature potentials of the neuromuscular union in the frog. The ability of the uncouplers to increase membrane conductance and to release Ca^{++} ions from the mitochondria and vesicles of the endoplasmic reticulum was used to introduce Ca^{++} ions into the nerve endings near the inner surface of the axon membrane. All the uncouplers studied increased miniature potential frequency by 2-3 times, and the mean amplitude (2-3 times) in both Ringer's solution and Ca^{++} -free solutions. Correlated effects of the uncouplers on bimolecular (artificial phospholipid) membrane conductance, mitochondrial respiration, and miniature potential frequency were observed. Data confirm an earlier proposed hypothesis that the secretion of acetylcholine from the nerve endings is connected with the adhesion of the synaptic vesicles to the membrane of the nerve ending under the action of van der Waals forces. The increase in the concentration of Ca^{++} ions, freed from the mitochondria under the action of the uncouplers of oxidative phosphorylation, led to screening out the surface negative discharges of the membranes and to an increase in the secretion of acetylcholine.—*I. D. London.*

Lindsay, R. D. (Syracuse U.) *Compound net model of the cerebral cortex.* *USAF AMRL Technical Report*, 1969 (Jun), No. 68-189, 61 p.—Based on the belief that the CNS consists of a network of neurons, combining in its structure genetically determined design with probabilistic features, a model is described in which probabilistic nets are used as building blocks from which systems can be assembled. The operation of compound nets is based on the dynamics of single probabilistic nets and on a set of assumptions concerning the coding of sensory information into the language of central neuronal activity. Data describing the dynamics of simple nets are presented. It is found that various types of information processing can be explained by applying the hypothesis of synaptic facilitation to compound nets. Sustained neural activity is investigated, particularly the problem of ergodicity. Highly nonergodic types of reverberations were found both theoretically and by computer simulation for certain types of nets. (39 ref.)—*Journal abstract.*

Change in excitability of an adjacent fiber.] *Biofizika*, 1970 (Jan), Vol. 15(1), 120-129.—Presents a mathematical analysis of the conduction of nerve impulses along fibers adjacent to each other and bathed in a limited volume of conducting fluid. A system of equations was deduced for membrane potential differences, and its solution found. 2 stationary solutions were obtained for each fiber, corresponding to impulses with different rates of propagation. 1 of these impulses was stable; the other unstable. A case is analyzed in detail where the impulse of nervous excitation was propagated along only 1 of the fibers, while the 2nd one remained passive. As this occurred, a wave of membrane potential changes was propagated along the 2nd fiber, so that in the beginning it was hyperpolarized (increased) then depolarized (decreased), and finally again hyperpolarized (increased). Such a change in excitability has been experimentally observed. Conditions in another situation are analyzed, where the threshold of excitability was decreased. If it was diminished to zero, spontaneous excitation of the fiber occurred. Analysis shows that such excitation was practically impossible under normal conditions. It could only happen if the threshold of excitability of the 2nd fiber was artificially lowered, as a consequence, for example, of its injury or treatment by special chemical agents.—*I. D. London.*

232. Mogendovich, M. R. (Ed.) *Motorno-vistseral'nye refleksy v fiziologii i klinike*. [Influence of stimulation of the vestibular analyzer on cerebral circulation in man.] *Fiziologicheskii Zhurnal SSSR*, 1969 (Sep), Vol. 55(9), 1100-1104.—40 16-30 yr. old Ss were utilized in a rheoencephalographic study of changes in cerebral blood flow under angular acceleration. Single excitation of the ampullar apparatus by an adequate stimulus (angular acceleration) produced a pronounced and prolonged (up to 5-8 min.) change in cerebrovascular tonus. Impulsations, originating from the ampullae of the semicircular canals, produced 2 types of cerebrovascular reactions. In some Ss a pronounced and prolonged (up to 5-8 min.) constriction occurred in the internal carotid arterial system, while in others a temporary dilatation was followed by prolonged constriction. In the vertebrate arterial system, in some Ss a pronounced and prolonged (up to 5-8 min.) dilatation occurred; in others, constriction. The data broaden to a certain degree our ideas concerning the genesis of vestibulo-autonomic disorders, arising in persons suffering from different diseases of the vestibular analyzer and in healthy persons under specific conditions developing in flight." (English summary)—*I. D. London.*

234. Peters, Ronald H. & Kent, Michael A. (Iowa State U.) *Preoptic temperature during oral and intragastric feeding*. *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 135-136.—Recorded preoptic brain temperatures of 4 male Sprague-Dawley rats during oral and intragastric feeding. Oral ingestion of solid dry food was the only treatment that significantly increased preoptic

temperature. Oral ingestion of liquid food and infusion of either liquid food or water directly into the stomach via a cannula failed to produce a significant change in brain temperatures. These data are not consistent with J. R. Brobeck's thermoregulatory hypothesis which predicts that both ingested and infused liquid nutrients should also increase preoptic temperature.—*Journal abstract.*

235. Pirlot, P. & Stephan, H. (U. Montreal, Quebec, Canada) *Encephalization in Chiroptera*. *Canadian Journal of Zoology*, 1970 (May), Vol. 48(3), 433-444.—51 species representing 10 families of bats were compared using the relation of brain weight to body weight as an estimate of degree of encephalization. The degree of encephalization appeared to be more related to their particular feeding behavior rather than to their position on the scale. The insect-eating bats had the least amount of encephalization while those who were bloodsuckers and fruit eaters were the most encephalized.—*J. M. Roberts.*

237. Rabin, Edwin R., Jenson, A. Bennett, & Melnick, Joseph L. (Jewish Hosp., St. Louis, Mo.) *Herpes simplex virus in mice: Electron microscopy of neural spread*. *Science*, 1968 (Oct), Vol. 162(3849), 126-127.—Herpes simplex virus rapidly infected the trigeminal nerves of mice after intranasal inoculation. Centripetal neural spread was suggested by histologic evidence of encephalitis in the area of attachment of the trigeminal nerve. Furthermore, electron microscopy revealed virus replication primarily within Schwann cells of the trigeminal nerve, and neurons of the gasserian ganglion.—*Journal abstract.*

238. Wurtz, Robert H. (National Inst. of Mental Health, Lab of Neurobiology, Bethesda, Md.) *Visual cortex neurons: Response to stimuli during rapid eye movements*. *Science*, 1968 (Dec), Vol. 162(3858), 1148-1150.—While awake, unanesthetized rhesus monkeys held their eyes stationary, a motionless or slowly moving stimulus falling on the receptive field of striate cortex neurons produced an excitatory response. When a REM was made across the same stimulus, many of these neurons continued to give an excitatory response. The discharge of other neurons was unchanged or was suppressed during the eye movement.—*Journal abstract.*

Neuroanatomy

239. Harris, Fredric A. (U. Washington, Medical School) *Population analysis of somatosensory thalamus in the cat*. *Nature*, 1970 (Feb), Vol. 225(5232), 559-562.—Analyzed aggregations of neurons which have common natural stimulus sensitivity in anesthetized cats. Stimulus pulses were given to each forepaw via bipolar needle electrodes to evoke discharge and to identify

thalamic cells. Results of pooled data from 46 experiments demonstrated the isolation of 640 neurons of which 30% were classified as M neurons having irregular receptor fields on the contralateral forelimb and 1 or more other limbs. 68% were classified as S neurons. It is concluded that touch and hair cells and S and M neurons are segregated within the nucleus. In addition, hair cells outnumber touch cells in the set S by 50% as opposed to 30% in the M set.—*P. Shibelski.*

LESIONS

240. Colvin, Gerald B., Whitmoyer, David L., & Sawyer, Charles H. (State U. New York, Upstate Medical Center, Syracuse) **Circadian sleep-wakefulness patterns in rats after ovariectomy and treatment with estrogen.** *Experimental Neurology*, 1969 (Dec), Vol. 25(4), 616-625.—Obtained EEG records from 12 Sprague-Dawley unanesthetized freely moving rats with electrodes permanently implanted in the olfactory bulb, hippocampus, and frontal cortex while Ss were housed in large glass cylinders within a sound-, temperature-, and light-controlled chamber. EEG records were converted to percentages of alertness, slow-wave sleep, and paradoxical sleep for each 10-min interval around the clock and analyzed by computer. After ovariectomy, records showed greater amounts of slow-wave sleep/day largely because of major increases in nighttime slow-wave sleep levels. The circadian pattern of paradoxical sleep was altered by ovariectomy: the daily amounts of paradoxical sleep remained constant but the night-time hr. contained more and the daylight hr. concomitantly less, almost obscuring the circadian rhythm. Estrogen injections restored the circadian pattern by sharply reducing the amount of paradoxical sleep at night, resulting in significant diminution in total paradoxical sleep/24 hr. (23 ref.)—*Journal abstract.*

241. Glebovskii, V. D. & Zhdanov, V. A. (Pediatric Medical Inst., Leningrad, USSR) **Vliyaniye vagotomii na ventilyatsiyu legkikh pri spokoinom i usilennom dykhanii.** [Influence of vagotomy on pulmonary ventilation in quiet and increased respiration.] *Fiziologicheskii Zhurnal SSSR*, 1969 (Sep), Vol. 55(9), 1118-1124.—Ss were 13 decerebrated cats. Hypercapnic hyperpnea after vagotomy was not accompanied by an increase in the rate of respiration; its decrease was often observed. When the vagal nerves were intact, increase in the rate of respiration was due to afferent impulses from the pulmonary mechanoreceptors. Depth and rate of respiration in hypercapnic hyperpnea were regulated by separate mechanisms and could change independently. CO₂ acted in an excitatory manner on the structures of the respiratory center, determining the depth of respiration. The maximal magnitude of pulmonary ventilation after vagotomy decreased by more than twofold. The pulmonary afferent system played an important role in securing high levels of pulmonary ventilation. The chemoreceptor mechanisms of the pontobulbar region of the brain were capable of securing, in the quiet state of the organism, a constant level of pulmonary ventilation independently of whether the vagal nerves were intact. (English summary) (19 ref.)—*J. D. London.*

Brain Lesions

242. Barnes, P. J., Smith, L. M., & Latta, R. M. (Psychological Lab., Cambridge, England) **Orientation**

to visual stimuli and the superior colliculus in the rat. *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 239-247.—Trained 12 naive female hooded rats in a 6-choice jumping stand apparatus to enter the dark door and avoid the 5 bright doors. Ss with bilateral superior collicular lesions were severely impaired, although further experiments showed that they were able to discriminate bright from dark stimuli and could perform correctly if allowed to approach each door in turn. It is suggested that the superior colliculus is important in orientation to visual cues, and there is some evidence that it is involved in orientation to brightness but not visual form cues. 244. Butter, Charles M., McDonald, John A., & Snyder, Daniel R. (U. Michigan) **Orality, preference behavior, and reinforcement value of nonfood object in monkeys with orbital frontal lesions.** *Science*, 1969 (Jun), Vol. 164(3885), 1306-1307.—Reports that 4 adolescent male rhesus monkeys with orbital frontal ablation, compared with 4 sham-operated controls, showed enhancement of oral tendencies toward nonfood items. Unlike controls, they persistently performed an instrumental response for 1 of these nonfood items. However, lesioned Ss did not show altered preferences for food vs. nonfood items. Findings suggest that reinforcement value and preferential ordering are dissociated by orbital frontal ablation.—*Journal abstract.*

245. Deets, Allyn C., Harlow, Harry F., Singh, Sheo D., & Blomquist, Allen J. (U. Wisconsin) **Effects of bilateral lesions of the frontal granular cortex on the social behavior of rhesus monkeys.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 452-461.—Observed 11 rhesus monkeys with bilateral lesions of the frontal granular cortex and 11 matched controls during pairings with each of 12 stimulus monkeys. Frontal Ss were more withdrawn and distressed than the controls. Operated Ss showed less proximity and contact with the stimulus Ss, directed less exploration toward the inanimate environment, and displayed more fear grimacing, screeching, and other disturbance behaviors. The stimulus Ss, in turn, interacted less with the frontal Ss than with the controls. They spent less time near the operated Ss, and less frequently mounted and presented to them. Overall, the operated Ss directed more challenges toward the male stimulus Ss, threatening them more than was appropriate for the circumstances, although levels of overt physical aggression were no higher, and in some cases depressed, in the monkeys with frontal lesions. (18 ref.)—*Journal abstract.*

246. Holdstock, T. L. (U. Witwatersrand, Johannesburg, South Africa) **Plasticity of autonomic functions in rats with septal lesions.** *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 147-160.—Presented 2 experiments in which both control and septal rats (total N = 24) rapidly developed clear-cut differential autonomic responses. In contrast to the nonreinforced stimulus which produced slight heart rate (HR) change and small GSR, the reinforced stimulus produced consistent deceleration of HR and larger magnitude GSR. In marked contrast to the control group, septal Ss consistently exhibited smaller overall GSR and higher base-line levels of skin resistance. Septal Ss also showed less accelerative HR response to shock, but greater persistence of response

with repeated shocks. The hypothesis was considered that the autonomic nervous system of septal animals was chronically imbalanced due to a decrease in sympathetic tonus. (French & German summaries) (3 p. ref.)—*Journal abstract.*

247. Iwai, Eichi & Mishkin, Mortimer. (Fukushima Medical Coll., Japan) **Further evidence on the locus of the visual area in the temporal lobe of the monkey.** *Experimental Neurology*, 1969 (Dec), Vol. 25(4), 585-594.—Tested pattern discrimination retention in 33 Macaca mulatta monkeys divided into 9 operated groups in an attempt to define the limits of the inferotemporal visual area more precisely than before. 6 groups had small coronal strip lesions distributed along the length of the inferior temporal convexity, and the other 3 had much larger removals adjacent to the convexity. Impairment was found only after the small strip lesions made in that part of the inferotemporal cortex which extends from the ascending limb of the inferior occipital sulcus forward for about 2 cm. to the posterior tip of the anterior middle temporal sulcus. Correlation with data from neuroanatomical and neuronographic studies suggests that this behaviorally defined visual area may be composed of 2 neurally distinguishable subareas, TE and TEO of G. V. Bonin and P. Bailey. (17 ref.)—*Journal abstract.*

248. Kemble, Ernest D. & Beckman, Gary J. (U. Minnesota, Morris) **Vicarious trial and error following amygdaloid lesions in rats.** *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 161-169.—19 rats with amygdaloid lesions showed increased vicarious trial and error behavior and errors during the acquisition and reversal of a position discrimination. Results suggest that the amygdala of the rat, as well as that of the monkey, is vitally involved in attention-directing behavior. More than 1/2 of the amygdaloid Ss refused to make a choice in the apparatus during the experiment and were discarded. 2 possible interpretations of this finding are discussed. (French & German summaries)—*Journal abstract.*

249. Kulagin, A. S. & Shik, M. L. (Inst. for Problems of Information-Transmission, Moscow, USSR) **Vzaimodeistvie simmetrichnykh konechnostei pri upravlyaemom lokomotsii.** [Interaction of symmetrical extremities during controlled locomotion.] *Biofizika*, 1970 (Jan), Vol. 15(1), 164-170.—Studied the controlled locomotion of 15 mesencephalic cats on a treadmill with 2 tracks—a left and a right, each capable of independent change of velocity. With two- and threefold differences of track velocities, the symmetrical extremities of the Ss produced stepping movements in common rhythm (with identical cyclic duration). At the same time, the structure of the stepping cycle of the extremities remained the same as in velocities of locomotion corresponding to those of the "bonded" tracks (the normal case). With greater differences of velocities, the interaction of the extremities changed, and stepping movements could arise with a ratio of cyclic duration of 1:2.—I. D. London.

250. Lindsley, D. F., Barton, R. J., & Atkins, R. J. (U. Southern California, Medical School) **Effects of subthalamic lesions on peripheral and central arousal thresholds in cats.** *Experimental Neurology*, 1970 (Jan), Vol. 26(1), 109-120.—Implanted 6 cats with electrodes to compare peripheral and central EEG and behavioral arousal thresholds. After making bilateral subthalamic lesions, 5 Ss showed increased sciatic EEG and behavioral arousal thresholds. This increase in peripheral

arousal thresholds was not simply a reflection of increased central-arousal thresholds, as 4 Ss had reticular-formation EEG and behavioral arousal thresholds which were either less than or the same as before the lesions were made. The latency for EEG arousal was 2-4 times longer than before the lesion in some threshold trials. Durations of EEG and behavioral arousal were shorter than before lesions, which was consistent with Ss' lack of sustained attention to sensory stimuli. There was more slow-wave EEG activity following subthalamic lesions, which was perhaps related to Ss' waxing and waning state of vigilance with increased periods of inattention and drowsiness. Gross behavioral observation indicates that Ss were hypophagic, hypokinetic, and hyporesponsive. It is suggested that subthalamic involvement in problems of attention and vigilance may be related to interruption of interconnections of limbic and neocortical areas with subcortical regions, interconnections which are important in initiating and sustaining attention to sensory stimuli.—*Journal abstract.*

251. Long, Charles J. & Tapp, Jack T. (Memphis State U.) **Significance of olfactory tracts in mediating response to odors in the rat.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 435-443.—Assessed the importance of fiber tracts which connect the olfactory bulb to other areas of the brain in the mediation of 48 albino male Holtzman rats' reaction to odors. When compared with sham controls, Ss with bilateral lesions of the lateral olfactory tract showed severe impairments in their preference for rat-food odor and their capacity to use an odor cue to learn to avoid shock in a double-grill box and discriminate the location of an odor in a T maze. No preference deficits were observed in Ss with bilateral lesions in the olfactory tubercles, the anterior limb of the anterior commissure, or the neocortex. Since these groups could thus detect the odor, no further tests were run. Results suggest that the lateral olfactory tract, like the olfactory bulb, is necessary for the detection of odor. 253. Murphy, Helen M. & Brown, Thomas S. (John Carroll U.) **Effects of hippocampal lesions on simple and preferential consummatory behavior in the rat.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 404-415.—Examined simple and preferential consummatory behaviors in 20 male Sprague-Dawley rats with hippocampal and neocortical lesions and in 10 operated controls in a number of behavioral tasks. Changes in consummatory behavior were observed in Ss with hippocampal lesions. Such changes consisted of an absence of the typical rat preference for sucrose in a 5-min test session, attenuation of increased NaCl intake following subcutaneous injection of formalin, attenuation of a negative contrast effect following a downshift in incentive from 32% to 4% sucrose, and increased intake of a highly palatable solution of glucose and saccharin over a 24-hr test session. The observed changes in consummatory behavior are secondary to some change in perseverative tendencies rather than as primarily resulting from incentive changes. (25 ref.)—*Journal abstract.*

254. Robinson, John S. & Voneida, Theodore J. (Somona State Hosp., Brain-Behavior Research Center,

Eldridge, Calif.) **Quantitative differences in performance on abstract discriminations using one or both hemispheres.** *Experimental Neurology*, 1970 (Jan), Vol. 26(1), 72-83.—Trained 8 male adult cats to a stringent criterion on abstract 2-choice visual pattern discriminations and then tested them with task information relayed to both hemispheres, or to only 1 hemisphere. Essentially normal, high-level response was possible with cue inputs to 1 eye only, even following section of the optic chiasm or the corpus callosum. If both structures were cut, so that unilateral inputs were restricted to 1 hemisphere, however, there was a sizable permanent decrease in accuracy of performance (accuracy under the bilateral inputs condition remained high). Performance on simple discrimination tasks, employing patterns with the same or greater acuity demands, was not affected by such restriction of inputs to 1 hemisphere. This finding, and the fact that some Ss can perform at a normal preoperative level after chiasm section, rule out explanation of the loss in single-hemisphere abstract task performance solely in terms of destruction of visual fibers. A more plausible interpretation of the results is provided in terms of a principle of cortical mass action, which assumes that the asymptotic level for performance on complex tasks may depend on the amount of cortex participating in the processing of task information. (18 ref.)—*Journal abstract*.

255. **Schneider, Gerald E.** (Massachusetts Inst. of Technology) **Two visual systems.** *Science*, 1969 (Feb), Vol. 163(3870), 895-902.—Describes experiments with 38 Syrian golden brain-damaged hamsters, 13 normal sham-operated controls, and other normal unoperated Ss. Data reveal that fundamentally different types of relative blindness are produced by ablation of cortical or tectal visual areas of S's brain. Undercutting the superior colliculus abolishes the ability to orient toward an object, but not to identify it, according to tests of pattern discrimination learning. Ablating visual cortical areas has reciprocally opposite effects. Such results, obtainable only by varying the required response and the stimulus in tests of visually guided behavior, may be interpreted as a dissociation between mechanisms for 2 types of visuo-motor control maintained throughout vertebrate evolution. The possibility that the hamster is a particularly simple case should be borne in mind, however. 1 mechanism is concerned with the locating of objects and the other with the specific identification of objects, with actions directed toward or away from them. (33 ref.)—*Journal summary*.

256. **Schwartzkroin, Philip A., Cowey, Alan, & Gross, Charles G.** (Stanford U.) **A test of an "efferent model" of the function of inferotemporal cortex in visual discrimination.** *Electroencephalography & Clinical Neurophysiology*, 1969 (Dec), Vol. 27(6), 594-600.—Presented paired flashes of light to 3 rhesus monkeys under a variety of testing conditions. The amplitude of the evoked response at striate cortex to the 2nd flash was expressed as a percentage of the response to the 1st flash and plotted against interflash interval to yield a recovery function. Bilateral removal of inferotemporal cortex failed to change the recovery function. The hypothesis that inferotemporal cortex exerts an inhibitory influence on the visual system is not confirmed. (French summary) (18 ref.)—*Journal summary*.

258. **Sclafani, Anthony; Belluzzi, James D., & Grossman, Sebastian P.** (U. Chicago) **Effects of lesions in the hypothalamus and amygdala on feeding behavior in the rat.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 394-403.—Lesions in the ventromedial hypothalamus (VMH) of 13 adult female albino Sprague-Dawley rats produced hyperphagia, obesity, and finickiness and decreased the latency to feed in a novel environment, a test which should be little influenced by VMH damage according to the satiety center hypothesis. A similar decrease in latency to feed was produced in controls by food deprivation. Lesions in the corticomedial amygdala (CMA) of 7 Ss inhibited feeding in a novel environment but did not influence ad-lib food intake in the home cage. The CMA-lesioned Ss performed like controls in tests of open-field activity and shuttle-box avoidance, indicating that an interpretation of the observed inhibition of feeding in terms of increased emotional reactivity is unlikely. 6 Ss with combined VMH and CMA lesions responded to food like VMH-lesioned Ss, suggesting that the influence of the amygdaloid mechanisms is mediated by the ventromedial hypothalamus. 260. **Thompson, Venan E.** (Chicago Wesley Memorial Hosp., Neurosurgical Research Lab., Ill.) **Visual de-cortication in infancy in rats.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 444-451.—Presented an open-field light-preference apparatus, an 8-cul maze, and a shock-avoidance pattern-discrimination problem to 22 normal male Long-Evans rats, and Ss which had received an ablation of the posterior cortex at either 17 (N = 10) or 76 (N = 25) days of age. Data indicate that, in contrast to previous results on neonatal brain damage, the 17-day-old operated group were more similar to the other operated group than they were to the normal Ss. Because an additional group of Ss was able to learn a shock-avoidance brightness-discrimination problem, the deficits in behavior observed in the early-lesioned group could not be attributed to a specific sensory loss produced by the operation. (16 ref.)—*Journal abstract*.

262. **Voneida, Theodore J. & Robinson, John S.** (Case Western Reserve U., Medical School) **Effect of brain bisection on capacity for cross comparison of patterned visual input.** *Experimental Neurology*, 1970 (Jan), Vol. 26(1), 60-71.—8 male adult cats learned to use the relations between pattern elements as cues for response in abstract 2-choice discrimination tasks. Ss were then given tests with components of the pairs relayed to the separate eyes so that correct response required central cross integration of the pair elements. Normal Ss and Ss with either optic chiasm or the caudal $2/3$ of the corpus callosum sectioned could perform the tasks at a high accuracy level; but when both structures were sectioned, there was a sizable performance loss. Such surgery did not completely interrupt interhemi-

spheric information transfer, however, because Ss were still able to perform consistently at an above-chance level (the surgery did effectively eliminate interhemispheric discrimination habit transfer—Ss learned contradictory habits with the separate eyes). The rostral 3rd of the corpus callosum may play a role in such transfer—I S performed at the 65-70% level following section of the chiasm and caudal $\frac{2}{3}$ of the corpus callosum. With subsequent section of the rostral callosal fibers, there was a reduction in performance to the chance level. (23 ref.)—*Journal abstract*.

Brain Hypothalamic & Hippocampal Lesions

263. Buerger, A. A. (Harvard U.) **Effects of preoperative training on relearning a successive discrimination by cats with hippocampal lesions.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 462-466.—Verified in a preliminary experiment that adult cats with hippocampal and pyriform lesions—Group 1 (N = 6)—were inferior to normals—Group 2 (N = 5)—on a successive (go, no-go) auditory brightness discrimination (A-B). The major experiment determined if preoperative training would eliminate these postoperative learning deficits. 10 unoperated Ss learned A-B. 5 Ss (Group 3) received hippocampal lesions, the remainder (Group 4), control operations. Group 3 was not inferior to Group 4 in postoperative relearning of A-B ($p < .421$), but was inferior in postoperative acquisition of a successive (go, no-go) visual pattern problem ($p < .014$). Results appear analogous to the memory deficits found in neurosurgical patients who, after hippocampal lesions, retain preoperative information better than they acquire new information postoperatively. (15 ref.)—*Journal abstract*.

264. Herberg, L. J. & Blundell, J. E. (Inst. of Neurology, London, England) **Non-interaction of ventromedial and lateral hypothalamic mechanisms in the regulation of feeding and hoarding behaviour in the rat.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 133-141.—Lesions of the hypothalamic ventromedial nucleus (VMN) in 10 male hooded rats led to an immediate increase in food intake but not in hoarding activity. When Ss were obese, they failed to hoard even in response to a 16-hr deprivation schedule, although this schedule did produce hoarding if body weights were held at or were brought down to preoperative levels. Results indicate that the lateral hypothalamic mechanism responsible for hoarding and feeding responds to long-term nutritional factors, and that it is not directly affected by the short-term satiety mechanisms in the VMN. Findings support the hypothesis that: (a) even nonphysiological activities, e.g., hoarding, exploration, are motivated by physiological needs; and (b) the reason these activities do not ordinarily covary with physiological drives is that they are not subject to inhibition by hypothalamic satiety mechanisms. (31 ref.)—*Journal abstract*.

265. Waxler, Morris & Rosvold, H. Enger. (Howard U.) **Delayed alternation in monkeys after removal of the hippocampus.** *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 137-146.—Tested 16 monkeys on spatial delayed alternation following complete removal of the hippocampus. 8 were trained preoperatively while 8 received training only postoperatively. Results indicate that the effects of hippocampectomy on delayed alternation are extremely variable. In some instances there is relatively

little impairment; in others, there is a severe impairment. Individual differences appear to be an important factor in determining the severity of the impairment. Possible sources of these individual differences are discussed. (French & German summaries) (17 ref.)—*Journal abstract*.

BRAIN STIMULATION

Chemical Stimulation

266. Blundell, J. E. & Herberg, L. J. (Inst. of Neurology, London, England) **Adrenergic stimulation of the rat diencephalon and its effect on food intake and hoarding activity.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 125-132.—The diencephalic areas most sensitive to micro-injections of noradrenaline lay outside the area of the lateral hypothalamus in which feeding can be produced by electrical stimulation. Injection of either area, including injections that caused increased feeding, failed to have any effect on hoarding activity in 14 male hooded rats. Since hoarding can be elicited both by food deprivation and electrical stimulation of the lateral hypothalamus, findings indicate biochemical, anatomical and motivational differences between the central feeding mechanism sensitive to adrenergic stimulation and that responding to electrical stimulation or nutritional depletion. It is suggested that the former mechanism may be disinhibitory and the latter, excitatory. (27 ref.)—*Journal abstract*.

267. Chirkov, V. D., Kuzovlev, V. V., & Manannikov, A. S. (Kirov Medical Inst., Gorki, USSR) **Issledovanie impedansa kory polusharii v svyazi s izucheniem nesinapticheskogo deistviya biopotentsialov.** [Investigation of impedance of the cerebral cortex in connection with study of the nonsynaptic action of biopotentials.] *Biofizika*, 1970 (Jan), Vol. 15(1), 84-88.—Ss were 15 unnarcotized immobilized cats. Strychninized parts of the cortex, from which epileptiform discharges arise, possessed less impedance than was true in the normal state. The impedance of an isolated strip of cerebral cortex was higher than that of the intact neocortex. Although rapidly proceeding cellular potentials enjoy better physical conditions for propagation across brain tissue, slow summated waves, possessing greater current intensity, can act at a greater distance. It is necessary to explain the increase in conductivity of the strychninized cortex as the result of increased ionic permeability of the membranes of the nerve cells, while decrease in conductivity of the isolated strip of the cortex is evidently due to a decrease in discharge of the membranes.—I. D. London.

270. Reinis, Stanislav. (York U., Toronto, Ontario, Canada) **Effect of hydroxylamine on maze learning in mice.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 512-518.—An intracranial injection

tion of .5 M hydroxylamine given 24 hr. prior to or 1 or 4 hr. following the learning of a water maze impaired retention of the preference for 1 arm in 550 Swiss albino mice. An injection 24 hr. after the training session was less effective. The impairment was better expressed if Ss were tested 48 hr. following the training session than if they were tested 24 hr. after training. Exhaustion of Ss due to swimming, hypoxia due to methemoglobin formation, and occult seizures did not contribute substantially to the effect. The .3 M sodium nitrite in the dose of 20 μ l. administered intracerebrally also affected the learning and retention of preference to 1 arm of the water maze. The general trend of the effect of the 2 substances is very similar. (22 ref.)—*Journal abstract.*

Electrical Stimulation

271. Bremner, Frederick J. & Eddy, Douglas R. (Trinity U.) **The effect of ESB on hippocampal EEG.** *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 179-183.—Hippocampal EEG of 5 rats was spectrally analyzed immediately after electrical brain stimulation (ESB) to the median forebrain bundle (MFB). Electrical stimulation of the MFB did not yield seizure patterns in the hippocampus. Results of this procedure did show however that ESB elicited spectra that were statistically different from those elicited by a flashing light, and similar to those produced in a conditioning situation. (French & German summaries)—*Journal abstract.*

272. Brown, Stephen & Trowill, Jay A. (Rutgers State U.) **Lever-pressing performance for brain stimulation on F-I and V-I schedules in a single-level situation.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 699-706.—Trained 9 naive male albino rats to lever press for electrical stimulation of the brain (ESB) and assigned Ss to either a fixed-interval (FI) 1-min or a variable-interval (VI) 1-min schedule of reinforcement. All Ss easily attained and maintained responding on the assigned schedule. Patterns of responding during training and extinction were similar to those observed when conventional rewards are used. FI Ss demonstrated scalloped responding; VI Ss demonstrated steady rates of responding. Implications of results for understanding ESB as a reward are discussed.—*Journal abstract.*

Southern California) **Recovery of memory following amnesia.** *Nature*, 1968 (Nov), Vol. 220(5168), 704-705.—Reports results of 4 experiments done with rats which indicate that a postamnesic foot shock can serve as a reminder for the return of a memory which has been inhibited by ECS. This is seen to indicate that at

least part of the memory remained, but that its retrieval was prevented by ECS.—P. Shibelski.

276. Manning, Alexander A. & Schneiderman, Neil. (U. Florida, Center for Neurobiology) **Stimulus generalization in rabbits conditioned to different intensities of caudate nucleus stimulation.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 374-383.—Classically conditioned nictitating membrane responses in 24 naive New Zealand white rabbits by pairing .07-, .18-, or .28-ma intensity electrical brain stimulation as the CS with peripheral shock as the UCS. A control group received random presentations of CSs and UCSs. Each group subsequently received CS alone or differential conditioning trials in which non-reinforced stimuli were presented at other CS intensities and locations. It was found that: (a) percentages of nictitating membrane responses were directly related to CS intensity regardless of the intensity of the training stimulus, (b) reliable stimulus generalization occurred between contralateral caudate nuclei when generalization was tested using CS alone trials rather than a differential conditioning procedure, and (c) stimulus generalization did not occur between the caudate nucleus and either lateral geniculate nucleus. (21 ref.)—*Journal abstract.*

277. Misanin, James R. (Susquehanna U.) **The effects of ECS on ECT: Implications for behavioral research.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 159-161.—Performed 2 experiments to determine the temporal pattern of ECS-induced changes in the electroconvulsive threshold (ECT) in 600 female albino Sprague-Dawley rats. Results indicated that immediately and for a short period of time after receiving a single ECS, the ECT of S was elevated, whereas 24 hr. after ECS, S's ECT was depressed. Implications of these findings for research on the behavioral effects of ECS are discussed.—*Journal abstract.*

278. Orlovskii, G. N. (Moscow State U., USSR) **O svyazyakh retikulo-spinal'nykh neuronov s "lokomotornymi otdelami" stvola mozga.** [On the connections of reticulospinal neurons with the "locomotor regions" of the brainstem.] *Biofizika*, 1970 (Jan), Vol. 15(1), 171-178.—Thalamic and mesencephalic cats were used in an intracellular microelectrode study of the responses of single neurons of the pontine and bulbar reticular formation to stimulation of 2 regions of the brainstem—the posterior hypothalamus and the "locomotor region" of the midbrain. The spontaneous activity of these reticulospinal neurons was a function of type of cat preparation. In decerebrated precollicular Ss, there was little spontaneous activity; in thalamic Ss, there was considerable activity. Most of the reticulospinal neurons responded monosynaptically to stimulation of 2 regions of the brainstem, from which it was possible to elicit locomotion: the "locomotor region" of the midbrain and the posterior hypothalamus.—I. D. London.

correlates of aversive and rewarding electrical stimulation of septal, hypothalamic and mesencephalic areas in rats. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5363-5364.

282. Slaughter, John; Hahn, William, & Rinaldi, Patricia. (U. Denver) Instrumental conditioning of heart rate in the curarized rat with varied amounts of pretraining. *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 356-359.—To evaluate the effectiveness of prior discrimination training on subsequent heart rate (HR) shaping under curare, 30 naive male albino Sprague-Dawley rats were divided into 3 groups on the basis of amount of discrimination training, (0, 2, and 4 hr.). Ss were then curarized and trained to increase or decrease HR with electrical stimulation of the brain as reward. Results indicate that Ss did learn to produce significant changes in HR in the reinforced direction, although amount of discrimination pretraining had no effect on the magnitude of these changes.—*Journal abstract*.

283. Wilcott, R. C. & Bradley, H. H. (Case Western Reserve U.) Low-frequency electrical stimulation of the cat's anterior cortex and inhibition of skin potential responses. *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 351-355.—Low-frequency electrical stimulation of the anterior cortex of 15 mongrel waking cats reduces the amplitude of skin potential (SP) responses elicited by an altering stimulus. Control observations demonstrate that the effect is not due to stimulation of blood vessels or polarization of cortical tissue. The partial laterality of SP response reduction, greater reduction at the contralateral side, agrees with the results of previous cortical injury studies. This suggests that the effect demonstrates a true physiological process. It is concluded that the anterior cortex contains both excitatory and inhibitory systems for SP responses and other components of arousal.—*Journal abstract*.

284. Wise, R. A. (McGill U., Montreal, Quebec, Canada) Hypothalamic motivational systems: Fixed or plastic neural circuits? *Science*, 1968 (Oct), Vol. 162(3851), 377-379.—Elicited eating and drinking by electrical stimulation through the same electrode in the hypothalamus of a satiated rat. 23 adult albino Wistar rats served as Ss. Intensity thresholds for eliciting eating and drinking were different, and both thresholds decreased with repeated testing. Findings suggest an alternative to the hypothesis that the neural organization of hypothalamic drive systems is modified by experience.

ELECTRICAL ACTIVITY

285. Arutyunov, V. S. & Polyakova, A. G. (Inst. of Physiology, Tbilisi, USSR) K proiskhozhdeniyu rannego komponenta otveta assotsiativnoi oblasti kory bol'shikh polushariy golovnogo mozga koshki. [On the origin of the early response component of the associative area in the cat cerebral cortex.] *Fiziologicheskii Zhurnal SSSR*, 1969 (Sep), Vol. 55(9), 1059-1069.—Narcotized and unnarcotized Ss were used in a microelectrode study. Following various peripheral stimulation (light flash, electrostimulation of the contralateral fore and hind limbs), a complex associative response consisting of early and late components was recorded in the associative cortex (anterior parts of the lateral and suprasylvian convolutions). The early component was observed in both groups of Ss; the late

component was absent in nembutal narcosis. In unnarcotized and chloralosed Ss, most of the responding neurons generated the late component of the associative response, while only a few of them generated the early component. The early component of the associative response coincided with the discharge of neurons, responding after a short latent period to only stimulation of single modality. The late component was due to the activity of mono-, bi-, and polysensory neurons, whose discharges possessed a longer latent period. In unnarcotized and chloralosed Ss, neuronal polysensory activity was promoted; in nembutal narcosis no polysensory reaction was noted. It is concluded that the formation of the late component of the associative response is connected with the functional state of the cortex favoring the formation of neuronal polysensory activity. The early component is generated through neuronal monosensory activity. The polysensory neurons, producing the late component of the associative response, are found in greater number in Layer IV of the cortex; there are more neurons, generating the early components, in Layers III and VI. (22 ref.)—*J. D. London*.

Washington, School of Medicine, Regional Primate Research Center) Operant conditioning of cortical unit activity. *Science*, 1969 (Feb), Vol. 163(3870), 955-957.—Conditioned the activity of single neurons in precentral cortex of unanesthetized monkeys (Macaca mulatta) by reinforcing high rates of neuronal discharge with delivery of a food pellet. Auditory or visual feedback of unit firing rates was usually provided in addition to food reinforcement. After several training sessions, Ss could increase the activity of newly isolated cells by 50-500% above rates before reinforcement.—*Journal abstract*.

289. Geron, E. (Physical Education Inst., Sofia, Bulgaria) O nekotorykh mekhanizmax volevogo usiliya. [Some conative mechanisms.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 62-75.—EEG, GSR, and EMG were recorded in 28 Ss during ergograph exercises which included the condition of verbal encouragement to overcome fatigue and pull the weight "a few more times." Visual inspection of the recordings led to the conclusion that the type of psychophysiological mechanism involved varies with the direction in which volition is exercised. When movements are being organized and learned, there is some isomorphism between GSR and

the alpha-rhythm on the 1 hand and the timing and rhythm of the movements on the other. When the effort is expended toward executing the movements, additional systems become involved under the influence of the instruction-induced set. (English summary)—*L. Zusne*.

Hawaii) **Change detection model for serially correlated multivariate data.** *Biometrics*, 1970 (Jun), Vol. 26(2), 269-280.—Presents a method for detecting change in multivariate stationary processes of a single S after stimulation. A finite multivariate autoregression is fitted to prestimulus data using a step-wise procedure with tests of significance. The technique has been applied to the detection of change in the brain waves of 2 human newborn infants following olfactory or visual stimulation.—*R. L. McCornack*.

295. Melkonyan, D. S. & Barsegyan, L. G. (Inst. for Advanced Medical Training, Erevan, USSR) **Operatornyi analiz elektoretinogramm.** [Operator analysis of electroretinograms.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 30-38.—Develops a mathematical method for electroretinogram analysis where the retina is viewed as a system, whose properties, though unknown, can be

studied through relating the character of the photic stimulus and the corresponding reaction of the eye (evoked potential). Under certain conditions this relationship may be described with the help of a linear stationary operator, whose properties may be studied by utilizing the amplitude-phase-frequency characteristics of the system. These characteristics are experimentally determined by presenting to the eye flashing light in the form of sinusoidal and right-angular impulses of various frequencies.—*I. D. London*.

296. Rupert, Allen L. & Moushegian, George. (Collier Hearing & Speech Center, Dallas, Tex.) **Neuronal responses of kangaroo rat ventral cochlear nucleus to low-frequency tones.** *Experimental Neurology*, 1970 (Jan), Vol. 26(1), 84-102.—Presents results of a study on the response characteristics of neurons within the ventral cochlear nucleus of 26 kangaroo rats which show that these neurons have best frequencies that range between .18 and 23 kc. The greatest percentage of these neurons, however, exhibit best frequencies below 2 kc. In terms of interspike interval and poststimulus time histograms, they were categorized as phase-locking, quasiphase-locking, and nonphase-locking neurons. Phase-locking neurons show recurrent peaks in the interval histograms that are multiples of the stimulus period, for all combinations of frequency (below 2 ks.) and intensity in their response areas. Nonphase-locking neurons may also show peak activities, but the intervals that appear are not frequency related, though they may be altered by changing the parameters of the stimulus. Quasiphase-locking neurons respond with features exhibited by the other 2 types. This classification is necessarily a 1st-order categorization. Response activity of cochlear nucleus neurons is so varied that such a classification, though too simple, does serve to extend our understanding of the distinctive features of low-frequency responding neurons. (19 ref.)—*Journal abstract*.

298. Shevel'ev, I. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **O korotkolatentnykh protsessakh v zritel'noi sisteme koshki.** [On processes of brief latency in the visual system of the cat.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 81-83.—Reports the results of a study of the early changes in summated slow potentials, which precede the development of the initial afferent flow, at all levels of the visual system of narcotized cats. Very short latent responses existed in the ganglionic layer of the retina and in the higher levels of the analyzer, providing evidence for the presence of a system of elements and fibers transmitting signals with very brief delays (4-5 times more rapidly than the main group). On the basis of the similarity of the restoration cycle of cortical responses, resulting from electrical stimulation of the optic nerve, to the preaffected fluctuations of cortical excitability, it is suggested that the latter result from a change in the excitability of the small group of elements with shortest latency following their synchronous activity.—*I. D. London*.

299. Smith, James D., et al. (U. Illinois, Chicago) **Midbrain single units correlating with pupil response to light.** *Science*, 1968 (Dec), Vol. 162(3859), 1302-1303.—The consensual response of the pupil in the

cat was driven by means of a light flux impinging on the contralateral retina. Spike trains recorded extracellularly from single units in the midbrain show correlation with the concurrently recorded pupil area. The temporal dynamics found confirm 2 earlier studies of single-unit responses and quantitative nerve stimulation. Both of these indicate that most of the 200-msec transport delay resides in the neuromuscular apparatus. Neurons whose activity correlated either with constriction or with dilatation phases of change in the pupil area were observed.—*Journal abstract.*

300. Smolyaninov, V. V. (Inst. for Problems of Information-Transmission, Moscow, USSR) **K obshchei teorii provedeniya vzbuzhdeniya po srede.** [On a general theory of propagation of excitation in a medium.] *Biofizika*, 1970 (Jan), Vol. 15(1), 130-139.—Based on the integral method, a general solution was obtained for the problem of propagation of excitation in a medium, described by Green's function and the form of the impulse of the generated current. An investigation into the properties of stationary propagation was carried out for several models of media. Basically, models were utilized which were equivalent to the neuronal synaptic medium since it was possible to independently determine their spatial and temporal properties. The cable medium model was compared with these media. The comparison of media was managed through use of a function involving the velocity of potential at the front of the excited region. The geometric meaning of spontaneous propagation of excitation in a medium is discussed.—*I. D. London.*

Electroencephalography & Evoked Potentials

301. Begleiter, H. & Platz, A. (State U. New York, Downstate Medical Center, Brooklyn) **Evoked potentials: Modifications by classical conditioning.** *Science*, 1969 (Nov), Vol. 166(3906), 769-771.—Explored the relation between classical conditioning and the late components of the visual evoked potentials in humans. Data were derived from monopolar scalp recordings of 16 college students. Visual evoked potentials to a positive discriminative stimulus change systematically during sensory conditioning and extinction. Changes due to conditioning are manifested in the increased amplitude of the late component of the evoked response. This effect is attenuated during extinction and reappears after reconditioning. (15 ref.)—*Journal abstract.*

302. Berezin, I. P., Pigarev, V. A., & Lerner, E. N. **Vliyaniye povyshennogo davleniya kisloroda na bioelektricheskuyu aktivnost' golovnogogo mozga.** [Influence of increased oxygen pressure on cerebral bioelectrical activity.] *Fiziologicheskii Zhurnal SSSR*, 1969 (Sep), Vol. 55(9), 1085-1091.—25 1-7 yr. old dogs and 32 5-6 mo. old rabbits were used to study changes in cerebral bioelectrical activity as a function of pressure of O_2 and exposure to it under controlled respiration and other conditions (influence of anesthesia; breathing of O_2 under pressure in a barochamber with the aid of a mask). The registration of EEGs in unanesthetized animals may serve as a method for subclinical recognition of the signs of the toxic action of O_2 under heightened pressure. Breathing of pure O_2 under atmospheric pressure (over a 3-hr period) did not produce pathological changes in cerebral bioelectrical activity. Convulsive activity in unanesthetized dogs, under machine-controlled respiration of O_2 under 3 atm. pressure, emerged after

breathing O_2 under pressure for 43 ± 10 min. According to EEG data, sodium thiopental anesthesia brought about a twofold increase in time for breathing O_2 under 3 atm. pressure without the emergence of convulsive activity. (English summary) (16 ref.)—*I. D. London.*

The last was frequently complicated by an afteraction discharge. Each phase was a separate component of the complex reaction of the associative

laboratories. Weil, Zinberg, and Nelson in Boston concluded that it is "feasible and safe to study the effects of marihuana on human volunteers who smoke it in the laboratory."—*B. A. Stanton.*

341. Ekstedt, Jan & Stålberg, Erik. (U. Uppsala, Wallenberg Lab., Sweden) **The effect of non-paralytic doses of D-tubocurarine on individual motor end-plates in man, studied with a new electrophysiological method.** *Electroencephalography & Clinical Neurophysiology*, 1969 (Dec), Vol. 27(6), 557-562.—Utilized a new method for the study of synaptic transmission in individual motor end-plates with 5 males, 28-34 yr. old. Single muscle fiber action potentials are recorded and the method is based upon the principle that when 2 muscle fibers, belonging to the same motor unit, are recorded at the same time, there is variability in the time interval between the 2 action potentials for consecutive discharges. This variability, of 10-30 msec, is called the jitter phenomenon and has been used to study D-tubocurarine. It was found that the jitter increases with doses of D-tubocurarine far below those required to give any neuromuscular block. This is the 1st in situ method for obtaining quantitative information concerning synaptic transmission in individual motor end-plates in man. (French summary)—*Journal summary.*

342. Farnsworth, Norman R. (U. Pittsburgh, School of Pharmacy) **Hallucinogenic plants.** *Science*, 1968 (Dec), Vol. 162(3858), 1086-1092.—Reviews chemical principles found in the major hallucinogenic plants, classifying them in terms of whether they are nitrogenous or nonnitrogenous. 14 plants are analyzed according to their family name and active principles, including marihuana and nutmeg (nonnitrogenous), and peyote, morning glories, and South American snuffs (nitrogenous). It is noted that chemical substances responsible for hallucinogenic effects are distinct for different plant families, thus suggesting unusually clear-cut chemotaxonomic relationships. (40 ref.)—*P. McMillan.*

343. Kornetsky, C. (Boston U., Medical School) **Psychoactive drugs in the immature organism.** *Psychopharmacologia*, 1970, Vol. 17(2), 105-136.—This review covers 2 areas of psychopharmacology: prenatal and neonatal effects of drugs on later behavior of the developing organism and the action of various drugs on behavior disorders in children. Attention should be paid to the function of the central and automatic nervous systems and how these systems relate to the behavior of the child.—*P. Federman.*

344. Landauer, Ali A., Milner, Gerald, & Patman, Joanna. (U. Cambridge, England) **Drugs which affect the structure and function of DNA.** *Nature*, 1968 (Sep), Vol. 219(5161), 1320-1325.—Reports that mitomycin, actinomycin, and certain acridines and phenanthridines combine with DNA. These combinations result in distortions in the structure and functioning of DNA. (37 ref.)—*B. A. Stanton.*

348. Weil, Andrew T., Zinberg, Norman E., & Nelsen, Judith M. (Boston U.) **Clinical and psychological effects of marihuana in man.** *Science*, 1968 (Dec), Vol. 162(3859), 1234-1242.—Employed 9 male 21-26 yr. old chronic users and 9 naive nonusers in a double-blind study in a neutral setting involving ingestion of marihuana via smoking. Placebo cigarettes consisted of stems of the male hemp plant. All Ss inhaled the smoke according to procedures standardized for the study. A series of physiological (e.g., heart and respiration rate, pupil size, blood glucose level, and conjunctival vascular state), and psychological measures (including the Continuous Performance Test, Digit Symbol Substitution Test, and the pursuit rotor) were obtained on a prearranged schedule extending over 3 hr. following inhalation of marihuana. Results suggest that: (a) laboratory study of effects of marihuana is feasible; (b) subjective reports following low and high doses differ between naive and chronic users; (c) some impairment on simple intellectual and psychomotor tests was observed in naive Ss, and was dose-related; regular users showed no comparable impairment; (d) the only significant physiological changes were moderate increases in heart rate, and reddening of the eyes; and (e) in a laboratory setting, effects of a single inhaled dose of marihuana reaches greatest intensity within 1/2 hr. of inhalation, diminishes after 1 hr., and dissipates by 3 hr. (28 ref.)—*P. McMillan.*

Drug Effects-Animal

349. Alekseev, N. P. & Makarov, P. O. (Leningrad State U., USSR) **Vliyaniye inhibitorov metabolizma i ouabaina na retseptorny potentsial izolirovannogo myshechnogo veretena lyagushki.** [Influence of metabolic inhibitors and ouabain on receptor potential of

the isolated frog muscle spindle.] *Biofizika*, 1970 (Jan), Vol. 15(1), 93-98.—Isolated spindles of m. ext. longus digiti IV of the frog were used to study the action of metabolic inhibitors (2,4-dinitrophenol, sodium azide) and that of the cardiac glycoside, ouabain (strophanthin G), which presumably depress the work of the "metabolic pump," on the generation of receptor potential in the isolated stretch-receptor. Sodium azide (3 mM.) and 2,4-dinitrophenol produced, within 1 min. and 30-40 sec., respectively, a decrease in the amplitude of the hyperpolarization phase of receptor potential. However, no significant changes were noted in the amplitude of the depolarization phase of receptor potential and that of the action potentials. Later, the amplitudes of both decreased. Changes in receptor potential were reversible. Ouabain produced within 4-5 min. a decrease in amplitude of the hyperpolarization phase of receptor potential and then a decrease in amplitude of the depolarization phase of receptor potential and that of the action potentials. Restoration of receptor potential and action potential through immersion in pure physiological solution for 30-40 min. was not observed.—*I. D. London*.

350. **Baum, Morrie.** (McGill U., Montreal, Quebec, Canada) **Effect of alcohol on the acquisition and resistance-to-extinction of avoidance responses in rats.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 759-765.—Explored the effects of alcohol on avoidance behavior in female albino Sprague-Dawley rats. In Exp. I, the effect of alcohol on the acquisition of an avoidance response was examined in a 2×4 factorial design. 120 Ss were trained to avoid in 1 of 2 simple avoidance tasks following the administration of 1 of 4 alcohol doses. Alcohol significantly affected the latency of the 1st escape trial but did not significantly influence the measures of avoidance learning. In Exp. II, a 2×3 factorial design was employed to study the effect of alcohol on the resistance to extinction of a previously learned avoidance response. 90 Ss were trained to avoid in 1 of the 2 tasks and then were given 1 of 3 alcohol doses prior to extinction. Alcohol significantly influenced resistance to extinction, with the appropriate dose increasing response persistence. Results indicate that alcohol does not reduce fear, or alcohol reduces fear, but the level of fear does not determine the acquisition or extinction of simple avoidance responses.—*Journal abstract*.

351. **Fibiger, Hans C., Lytle, Loy D., & Campbell, Byron A.** (Princeton U.) **Cholinergic modulation of adrenergic arousal in the developing rat.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 384-389.—Investigated the development of the antagonistic nature of the adrenergic and cholinergic systems in Sprague-Dawley rats. The cholinomimetic drug, pilocarpine, decreased amphetamine-induced psychomotor excitation in 20-25 day old Ss but not in younger Ss. In Exp. II, anticholinergic potentiation of adrenergic arousal was observed in 25- but not 15-day-old Ss. It is concluded that a cholinergic inhibitory mechanism develops gradually 15-25 days postnatally in the rat. (22 ref.)—*Journal abstract*.

352. **Groh, Georges; Lemieux, Marcel, & Groh, Véronique.** **Le LSD-25 et les araignées.** [LSD-25 and spiders.] *Toxicomanies*, 1969 (Sep), Vol. 2(3), 293-314.—Compares bidimensional spider webs of 3 types of spiders (*Araneus diadematus*, *Hyptiotes paradoxus*, and *Argiope aurentia*) prior to and following administration of 1 dose and repeated doses of LSD-25. Results show

severe disorganization in cobweb patterns following both single and repeated LSD-25 dosages. (English summary) (19 ref.)—*B. A. Stanton*.

353. **Holtzman, David; Lovell, Richard A., Jaffe, Jerome H., & Freedman, Daniel X.** (Bronx Municipal Hosp. Center, N.Y.) **1- Δ^9 -Tetrahydrocannabinol: Neurochemical and behavioral effects in the mouse.** *Science*, 1969 (Mar), Vol. 163(3874), 1464-1467.—Administration of pure 1- Δ^9 -tetrahydrocannabinol to C57Bl/6J female mice had the following dose-dependent neurochemical and behavioral effects: (a) a slight but significant increase in concentrations of 5-hydroxytryptamine in whole brain; (b) a decrease in concentration of norepinephrine in brain after administration of low doses and an increase after high doses; (c) diminished spontaneous activity, moderate hypothermia, hypersensitivity to tactile and auditory stimuli, and ataxia after low doses; and (d) sedation, pronounced hypothermia, and markedly diminished spontaneous activity and reactivity after high doses. The duration of effects on body temperature and spontaneous activity correlated generally with changes in brain amines. Characteristic changes in brain amines do not correspond exactly to those observed with other psychotropic drugs. (17 ref.)—*Journal abstract*.

354. **Horita, A. & Hamilton, A. E.** (U. Washington, Medical School) **Lysergic acid diethylamide: Dissociation of its behavioral and hyperthermic actions by DL- α -methyl-p-tyrosine.** *Science*, 1969 (Apr), Vol. 164(3875), 78-79.—Male albino rabbits treated with LSD-25 exhibit characteristic signs of hyperexcitability, increased peripheral sympathetic activity, and hyperthermia. When Ss received prior treatment with DL- α -methyl-p-tyrosine, the excitation and sympathetic actions of LSD-25 were abolished or attenuated, but the hyperthermia was unchanged from that of the controls. Concentrations of norepinephrine in brainstems of treated Ss were greatly decreased. The excitation of CNS and sympathomimetic actions of LSD-25 in the rabbit are apparently mediated by norepinephrine, whereas the hyperthermic action functions through a nonadrenergic mechanism.—*Journal abstract*.

355. **Houser, Vicent P.** (U. Massachusetts) **The effects of adrenergic and cholinergic agents upon discrimination in the rat.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5257.

356. **Houser, Vincent P.** (U. Massachusetts) **The effects of adrenergic and cholinergic agents upon eating and drinking in deprived rats.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 153-155.—Both scopolamine hydrobromide and scopolamine methylbromide reduced food intake, while decrements in water consumption were caused only by scopolamine hydrobromide. Ss were 45 male albino rats. Dextroamphetamine sulfate reduced food intake but did not affect water consumption. Finally, both pilocarpine nitrate and DL- α -methyl-p-tyrosine had no effects on either measure. Results confirm L. Stein's suggestion that anticholinergic agents decrease eating via their peripheral effects while blocking drinking through their central activity. It is suggested that the motivational effects of these agents should be considered whenever these drugs are administered to Ss that are under the control of appetitively motivated schedules of reinforcement.—*Journal abstract*.

effect of puromycin on retention of a positively reinforced response in goldfish. *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 181-183.—Trained 2 groups of goldfish ($N = 32$) to strike a small target for food reinforcement. 1 group was injected with puromycin, the other with saline, immediately following training. 2 days later, puromycin Ss performed as well as saline controls. —*Journal abstract.*

358. Layden, T. A., McGrath, W. R., & Smith, F. D. (Schick Pharmaceutical, Seattle, Wash.) **Psychopharmacological action of nicotinamide adenine dinucleotide.** *Psychopharmacologia*, 1970, Vol. 17(2), 198-202.—Studied the effect of nicotinamide adenine dinucleotide (NAD) on the response rates in variable-interval (VI) and Sidman avoidance schedules in rats. Bar pressing on the VI reinforcement schedule was significantly reduced during the 15 min. following the administration of 10 mg/kg and during the 60 min. following the administration of 30 mg/kg NAD. Response rates on the Sidman avoidance schedule were significantly reduced during the 60 min. following the administration of 100 mg/kg NAD.—P. Federman.

359. Lindstrom, L. H. (U. Uppsala, Sweden) **The effect of pilocarpine in combination with monoamine oxidase inhibitors, imipramine or desmethyl-imipramine on oestrous behavior in female rats.** *Psychopharmacologia*, 1970, Vol. 17(2), 160-168.—Increased central nervous monoaminergic activity brought about by the MAOs nialamide or pargyline or by desmethylimipramine augmented and/or prolonged the heat inhibitory effect of pilocarpine. Parallel studies on body temperature revealed that the synergism was probably not due to a decreased rate of elimination of pilocarpine for pargyline and desmethylimipramine.—P. Federman.

360. Malamud, Daniel & Baserga, Renato. (Temple U., Medical School) **Uridylate kinase activity: Effect of isoproterenol.** *Science*, 1968 (Oct), Vol. 162(3851), 373-374.—Isoproterenol stimulates cell proliferation in mouse salivary glands. Prior to the stimulation of DNA synthesis, ^3H -uridine incorporation into RNA is decreased. This decreased incorporation results from a depression of uridylate kinase activity.—*Journal abstract.*

361. Niemegeers, C. J., Verbruggen, F. J., & Janssen, P. A. (Janssen Pharmaceutica, Beerse, Belgium) **The influence of various neuroleptic drugs on shock avoidance responding in rats: III. Amphetamine antagonism in the discriminated Sidman avoidance procedure.** *Psychopharmacologia*, 1970, Vol. 17(2), 151-159.—Amphetamine increased responses and decreased warning stimuli, warning responses, and shocks in rats. Low doses of 4 neuroleptics antagonized the amphetamine-induced changes. The order of potency was haloperidol, pimozide, pipamperone, and chlorpromazine. The 1st 3 drugs restored the amphetamine-induced changes to the initial control levels in the order: shock, warning, warning responses, and responses. The order was reversed with chlorpromazine. The duration of action was pimozide, haloperidol, pipamperone, and chlorpromazine.—P. Federman.

362. Nosal, Gilliane. (U. Laval, Quebec, Canada) **Aspects cytopharmacologiques de l'abus des psychodysléptiques (hallucinogènes).** [Cytopharmacological aspects of abuse of psychodysleptics (hallucinogens).] *Toxicomanies*, 1969 (Sep), Vol. 2(3), 339-354. Reports recent observations made following administration of LSD-25 to Sprague-Dawley rats. Results

demonstrate that weak dosages of LSD-25 do not appear to produce any microscopically discernable changes of the nucleolus or Nissel body. Larger doses may produce changes, primarily at the level of the Nissel body, which in accord with the dosage present varying degrees of fragmentation and dispersion. No conclusions were drawn concerning teratological effects of LSD-25. —*English summary.*

363. Pishkin, Vladimir; Rasmussen, Elizabeth A., & Duke, Carla R. (Veterans Administration Hosp., Oklahoma City, Okla.) **Hydroxyzine and shock in operant behavior of rats.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 175-176.—25 shaped or unshaped water-deprived albino Holtzman rats injected with either saline or hydroxyzine-hydrochloride performed on a bar-pressing task. Unavoidable shock was provided throughout the experimental procedure. Hydroxyzine Ss outperformed their saline counterparts. Although there were no differences between the groups on the final shaping trial, hydroxyzine Ss maintained significantly higher levels of performance than saline Ss under shock conditions. —*Journal abstract.*

364. Potts, W. Joseph; Morse, David L., Cooper, Barrett R., & Black, William G. (G. D. Searle & Co., Chicago, Ill.) **The effect of magnesium pemoline, tricyanoaminopropene, and d-amphetamine on discriminated avoidance performance in rats as a function of age.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 141-143.—Compared the effects of magnesium pemoline, tricyanoaminopropene, and d-amphetamine on the acquisition of a discriminated avoidance response in 30-, 50-, and 100-day-old naive Long-Evans rats ($N = 96$). Ss were placed in an automated shuttlebox immediately after drug treatment. The number of avoidance responses in a series of 100 trials was measured. 10 days after the initial acquisition session, Ss were retrained on the same task. The 30-day group was inferior to the 50- and 100-day groups in the training session, but no differences occurred in retraining. Drug-treated Ss showed improved performance in the initial training session but were not different from controls in the retraining session. No Drug \times Age interaction was significant. (University Coll., London, England) **Equivalence and persistence of the effects of psychoactive drugs and past experience.** *Nature*, 1968 (Nov), 220(5170), 885-889.—The behavior of rats in a maze can be experimentally altered to a comparable extent either by psychoactive drugs or by previous experience of the maze. The effects of even a short drug-maze experience may stay with the organism for life. (18 ref.)—*Journal abstract.*

366. Shcherbakov, A. P. (Medical Inst., Ryazan, USSR) **O distroficheskom protsesse v tsentral'noi i perifericheskoi nervnoi sisteme v svyazi s perenesennoi ostroi intoksikatsiei fosfororganicheskimi soedineniyami.** [On the dystrophic process in the central and peripheral nervous system in connection with acute intoxication by phosphororganic compounds that has been suffered.] *Zhurnal Nevropatologii i Psikhatrii*, 1970 (Jan), Vol. 70(1), 60-64.—24 white rats, receiving ip metaphos in nonlethal doses of .4 mg/100 g., were used to study the lesions resulting from the selective anticholinesterase action by phosphororganic compounds on the peripheral nervous system and the CNS in the postintoxicational period. In both systems signs of

dystrophy of the myeline structures and of the nerve cells were observed. Morphological changes in the nerve elements remained pronounced even up to the 30th day after intoxication. These changes are viewed as correlated with the development of autoimmune processes in the organism and as a manifestation of autoallergic encephalopathy, myelopathy, and dystrophy of nerves and nerve roots in the remote period after intoxication.—*I. D. London.*

367. **Stolerman, I. P. & Kumar, R.** (University Coll., London, England) **Preferences for morphine in rats: Validation of an experimental model of dependence.** *Psychopharmacologia*, 1970, Vol. 17(2), 137-150.—Ss administered morphine to themselves by drinking it and became morphine dependent. Previous passive medication with morphine was not necessary. Aversions for the bitter morphine were converted into preferences after morphine was repeatedly given to relieve thirst. The consumption of quinine, equally aversive, did not increase, suggesting that merely pairing a bitter taste with relief of thirst did not account for the preference of morphine. Postingestional effects of morphine provided primary reinforcement; the bitter taste became a secondary reinforcer.—*P. Federman.*

368. **Thompson, T., Trombley, J., Luke, D., & Lott, D.** (U. Minnesota, Medical School) **Effects of morphine on behavior maintained by four simple food-reinforcement schedules.** *Psychopharmacologia*, 1970, Vol. 17(2), 182-192.—Rats conditioned on 3 values of fixed-ratio, variable-ratio, fixed-interval, and variable-interval food reinforcement schedules were administered 1, 3, and 6 mg/kg ip of morphine or saline. Overall response rate varied with schedule, schedule value, and morphine dose. The effect of morphine on overall rate varied with base-line rate generated by schedules, and the relative rate change also varied with the type of schedule.—*P. Federman.*

Johnstone Training & Research Center, Bordentown, N.J.) **Morphine-amphetamine-induced fighting and interm socialization.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 156-158.—Traumatic and lethal fighting was induced by a single moderate dose of amphetamine given during withdrawal from morphine. Ss were 39 hooded male Long-Evans rats. Socialization with other Ss during the interval between terminal morphine and amphetamine modifies the course of subsequent aggressive behavior. Fighting was prolonged for Ss maintained in isolation during the interdrug interval.—*Journal abstract.*

370. **Wallach, Marshall B., Winters, Wallace D., Mandell, Arnold J., & Spooner, Charles E.** (New York U., Medical Center) **A correlation of EEG, reticular multiple unit activity and gross behavior following various antidepressant agents in the cat: IV. Electroencephalography & Clinical Neurophysiology**, 1969 (Dec), Vol. 27(6), 563-573.—Recorded reticular formation multiple unit activity (RUA), EEG, EMG, and gross behavior from 22 adult cats chronically implanted with cortical and subcortical electrodes. Following the administration of various antidepressant agents 3 phases of drug-induced action were described: (a) Phase I, a short period of excitement accompanied by increased EMG, a desynchronized EEG, and increased RUA; (b) Phase II, characterized by a prolonged lowering of the RUA to the slow wave sleep level, EEG slow wave activity and behavioral quiescence without the behav-

ioral concomitants of sleep, lasting for 1-3 days; (c) Phase III, characterized by EEG and gross behavior comparable to control wakefulness, rhombencephalic phase of sleep and slow wave sleep. Amitriptyline, desmethylinipramine, imipramine, chlorpromazine, and perphenazine all induced Phases I and II. Only imipramine elicited Phase III. Convulsions were observed following high doses of amitriptyline, desmethylinipramine, and imipramine. Methamphetamine and pargyline induced changes characteristic of Phase I. Methamphetamine induced a prolonged period of alertness with an increased RUA level and desynchronized EEG. Pargyline elicited a period of alertness followed by a prolonged period of vacillating wakefulness and drowsy behavior. (French summary) (29 ref.)—*Journal summary.*

371. **Wallach, Marshall B., Winters, Wallace D., Mandell, Arnold J., & Spooner, Charles E.** (New York U., Medical Center) **Effects of antidepressant drugs on wakefulness and sleep in the cat. Electroencephalography & Clinical Neurophysiology**, 1969 (Dec), Vol. 27(6), 574-580.—Determined wakefulness-sleep cycles of 9 adult cats for each 24-hr period during control days and each day following the administration of various antidepressant agents: amitriptyline, desmethyl imipramine, imipramine, chlorpromazine, perphenazine, pargyline, and methamphetamine. All of the agents induced an initial suppression of the rhombencephalic phase of sleep (RPS). Methamphetamine induced an increase in total wakefulness, whereas the other agents induced an increase in slow wave activity. None of the agents induced a clear RPS rebound. The normal wake-sleep cycle reappeared in 3-4 days following the tricyclics and phenothiazines, in 4-5 days following pargyline, and in 2 days following methamphetamine. 372. **Way, E. Leong; Loh, Horace H., & Shen, Fu-Hsiung.** (U. California, Medical Center, San Francisco) **Morphine tolerance, physical dependence, and synthesis of brain 5-hydroxytryptamine.** *Science*, 1968 (Dec), Vol. 162(3859), 1290-1292.—Tolerance and physical dependence development to morphine in mice can be prevented by concomitant administration of cycloheximide. The fact that the rate of synthesis of brain 5-hydroxytryptamine (5HT) increases with tolerance to morphine suggests that the protein involved may be associated with 5 HT synthesis. Inhibition of this synthesis with p-chlorophenylalanine markedly decreases tolerance and physical dependence development to morphine. (15 ref.)—*Journal abstract.*

CARDIOVASCULAR PROCESSES

373. **Goldstein, Robert; Beideman, Larry; Hill, Shirley Y., & Stern, John A.** (Malcolm Bliss Mental Health Center, St. Louis, Mo.) **Heart rate as a function of deprivation and age in rats.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 360-365.—Recorded the heart rate of 96 23- and 101-day-old albino Holtzman rats prior to and during water and food deprivation. With the exception of the adult Ss on water deprivation, all deprived Ss manifested significant decelerative responses. Despite a 30% loss of body weight resulting from their water deficit, the adult Ss exhibited no signs of change in heart rate. The fact that the deprivation studies cited by R. B. Malmö in support of his interaction hypothesis utilized adult water-deprived

animals assumes considerable importance in the light of these results. (15 ref.)—*Journal abstract.*

374. Khomazyuk, A. I., Neshcheret, A. P., & Yavorskii, L. A. (Strazhesko Research Inst. of Clinical Medicine, Kiev, USSR) **Pressornye sinokarotidnye refleksi i koronarnoe krovoobrashchenie.** [Pressor sinocarotid reflexes and coronary circulation.] *Fiziologicheskii Zhurnal SSSR*, 1969 (Sep), Vol. 55(9), 1105-1110.—40 narcotized dogs were Ss in a study of the coronovascular reactions, resulting from the sinocarotid pressor reflexes, and their mechanisms. With the production of pressor sinocarotid reflexes, either the hydraulic resistance of the coronary vessels increased slightly and was practically the same as that emanating from extravascular influences or the coronary vessels dilated. Coronovascular dilatation was a local reaction, produced on stimulation of the receptors of the heart and after changes in its activity. The reflex reactions of the coronary vessels did not take essential part in the effector structure of the carotid reflexes, but depended on changes in the activity of the heart itself. Washington Press, 1970. xiii, 358 p. \$14.50.—Presents proceedings of a symposium sponsored by the Office of Noise Abatement of the Department of Transportation. Articles by various authors include discussions of (a) transportation noise sources, (b) scales for expressing noise level, (c) laboratory methods for evaluating human response to noise, (d) methods for evaluating community response to noise, and (e) relation between laboratory results and community response.

383. Giretti, M. L., Rucci, F. S., & La Rocca, M. (U. Sassari, Sardinia, Italy) **Effects of lowered body temperature on hyperoxic seizures.** *Electroencephalography & Clinical Neurophysiology*, 1969 (Dec), Vol. 27(6), 581-586.—Investigated the influence of hypothermia on the mechanism of hyperoxic seizures in 90 unrestrained, unanesthetized male Sprague-Dawley rats. In Group I the effect of simple hypothermia on the cerebral electrical activity was analyzed exhibiting preepileptic and spontaneous convulsive activity. Hyperbaric oxygen stopped the hypothermic seizures. The starting and development of hyperbaric seizures were investigated in Group II of hypothermic Ss in comparison with euthermic Ss submitted to simple hyperoxia. Hypothermia provoked a decrease in the incidence of seizures and an increase in their latency. It is suggested that by lowering the body temperature, a decrease in the metabolic activity of the whole organism and of the nervous system was induced. The rectal temperature of 27-21° C was particularly critical. Seizures in cooled Ss submitted to hyperoxia were more evident in subcortical than in cortical structures. NUTRITION & GASTROINTESTINAL PROCESSES

388. Tkhyong, N. (Inst. of Experimental Pathology & Therapy, Sukhumi, USSR) **K mekhanizmu postoyanoi sekretsii zheludochnogo soka natoshchak u nizshikh obez'yan.** [On the mechanism of steady secretion of gastric juice in lower simians when the stomach is empty.] *Fiziologicheskii Zhurnal SSSR*, 1969 (Sep), Vol. 55(9), 1132-1135.—Ss were 4 baboons and 3 monkeys from 2-3.5 yr. old. Ss were trained to permanent life (3-12 mo.) in a "primatological chair" and underwent experimentation in that chair. A steady secretion of gastric juice was detected in hungry Ss. In 6 Ss the quantity of juice was larger in daytime than at night. At night the release of free HCl was discontinued and the digestive capacity of the juice lowered. The steady secretion of the juice was attributed to the complex of environmental stimuli signaling the time of presentation of food. CR stimulation of the gastric glands, providing the basis of continuous secretion, was associated with the ever-present stereotype of frequent feeding under natural conditions and 3-times-daily feeding in the simian nursery. (English summary)—*I. D. London.*

ANIMAL PSYCHOLOGY

389. Ashe, Victor M. (U. Texas, Arlington) **The righting reflex in turtles: A description and com-**

parison. *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 150-152.—Tested 63 turtles, representing 50 species, for the righting reflex under 2 conditions, inversion and suspension. 92% performed the righting reflex under inversion; 67% performed the righting reflex under suspension. Differences in the performance of the righting reflex are noted and discussed in terms of natural selection and the evolutionary relationships between the species sampled.—*Journal abstract.*

391. Davis, Stephen F., Crutchfield, Walter P., Shaver, Janet, & Sullivan, Tom. (King Coll.) **Interspecific odors as cues for runway behavior.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 166-167.—7 male albino rats and 7 male Mongolian gerbils served as Ss in a cross-species test of the odor hypothesis. In both phases of a 2-phase experiment, rats followed gerbils on all trials in a straight runway. During the 1st phase, the relationship between the goal event received by the gerbils and by the rats was perfect (i.e., odor-maximizing conditions). During the 2nd phase a 50% contingency was introduced (i.e., odor-minimizing conditions). Results indicate that the rats learned to respond appropriately (fast to reward, slow to nonreward) during the 1st phase. Responding during the 2nd phase was nondifferential. Results support and extend the odor hypothesis.—*Journal abstract.*

392. Fox, M. W. (Washington U.) **A comparative study of the development of facial expressions in canids: Wolf, coyote and foxes.** *Behaviour*, 1970, Vol. 36(1-2), 49-73.—A developmental study of the social behavior of wolf, coyote, and fox was undertaken to determine whether between-species qualitative differences in facial expression were correlated social-ecological differences and to determine whether species-common expressions could be identified. It was found that facial expressions in these species were not detectable until about 3 wk. of age but that when developed, the expressions of wolf and coyote are much more variable and complex than those of the fox. Evidence suggests that "ontogeny recapitulates phylogeny" since facial expressions characteristic of foxes developed earliest in coyotes and wolves, while for these latter species, more complex patterns developed later in life. A detailed comparison of the facial expression of primate and canid is given, particularly as these are augmented by the development of facial markings and body movements. NATURAL OBSERVATION

395. Warner, G. F. (U. West Indies) **Behaviour of two species of grapsid crab during intraspecific encounters.** *Behaviour*, 1970, Vol. 36(1-2), 9-19.—Describes the field observation of the agonistic behavior of 2 nonterritorial crab species, *Aratus pisoni* and *Goniopsis cruentata*. Particular attention is given to avoiding actions, leg stretching, shield posturing, display, and fighting. It was found that ritualized agonistic behavior was restricted to the male in the sexually dimorphic *Aratus* species whereas this same type of behavior is extended to the female in *Goniopsis* which shows little sexual dimorphism. This species difference appears to be related to the size of the chelipeds. It is suggested that a high degree of sexual dimorphism frees the female for purely reproductive activities and provides for a ritualized social structure that reduces the possibility of injury to the individual. (German summary) (21 ref.).—S. R. Goldstein.

400. Holcomb, Larry C. (Creighton U.) **Prolonged incubation behaviour of red-winged blackbird incubating several egg sizes.** *Behaviour*, 1970, Vol. 36(1-2), 74-83.—Artificial eggs, simulating normal color and shape, were tested in 5 sizes with the intermediate size the same dimension as the normal egg. Eggs in the extreme classes were not incubated while those in the 3 intermediate classes were. Consideration is given to the role of the brood patch as an egg sensitive receptor controlling incubation length. (German summary) (42 ref.).—S. R. Goldstein.

401. Rosenblatt, Jay S. (Rutgers State U., Inst. of Animal Behavior) **The development of maternal responsiveness in the rat.** *American Journal of Orthopsychiatry*, 1969 (Jan), Vol. 39(1), 36-56.—Maternal responsiveness in the rat develops gradually during pregnancy, parturition, and the postpartum period. Virgins can be shown to have a basic level of maternal responsiveness, which is raised during pregnancy and again at parturition. After parturition the young maintain the mother's maternal responsiveness, but there are indications that as they grow older they cause a decline in her responsiveness. Maternal responsiveness is shown to be based upon substance(s) carried in the blood of the postparturient mother. Transferring blood plasma from a

new mother to a virgin causes the latter to become maternal towards young within 48 hr., where normally it requires 2-3 times this period of exposure to young. (45 ref.).—*Journal abstract.*

403. Askew, Henry R., Musimeci, Marilyn; Sloane, Lesley, & Stephan, Linda. (Fordham U.) **Effects of prey movement and background on predatory behavior of chameleons.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 171.—Tested 20 male and 20 female American chameleons (*Anolis carolinensis*) to determine the effects on predation of movement of prey and the color of the background on which the prey is presented. Results indicate that movement of the prey was critical to elicit stalking and eating, while background coloration had only a minor influence. An observed interaction of dominance and feeding behavior in the populations is also discussed.—*Journal abstract.*

404. Freed, Earl X., Carpenter, John A., & Hymowitz, Norman. (Veterans Administration Hosp., Alcohol Research Lab., Lyons, N.J.) **Acquisition and extinction of schedule-induced polydipsic consumption of alcohol and water.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 915-922.—Trained 16 Charles River (cd) rats to bar-press on a fixed-interval (FI) 60 schedule for varying number of days, $\frac{1}{2}$ with water present and $\frac{1}{2}$ with alcohol. Predictably, schedule-induced fluid consumption resulted. 10 days of extinction of bar-pressing followed. During FI 60 both groups bar-pressed approximately equally often but greater fluid consumption occurred in the group on water. During extinction, both groups showed reduced bar-pressing behavior. Whereas water consumption was extinguished in 2 days, alcohol consumption remained high and quite variable after bar-pressing had stopped. Results suggest that bar-pressing and fluid consumption are independent behaviors, which finding argues against explanations of schedule-induced polydipsia based on adventitious reinforcement. For some Ss, the termination of alcohol intake prior to the end of an FI 60 session without an associated cessation of bar-pressing suggests that schedule-induced polydipsia is a function of the aversiveness of the reinforcement schedule. (25 ref.).—*Journal abstract.*

405. Glick, S. D., Canfield, J. L., & Jarvik, M. E. (Albert Einstein Coll. of Medicine, Yeshiva U.) **A technique for assessing strength of a smoking preference in monkeys.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 707-710.—Trained 3 adult rhesus monkeys to puff 1 of 2 tubes to obtain water. Cigarette smoke was delivered through 1 tube and air through the other. 1 S showed a preference for the air tube. Another S showed a preference for the smoke tube. The 3rd S showed no smoke or air preference. This technique distinguished smoking from puffing.—*Journal abstract.*

406. Harriman, Arthur E. (Oklahoma State U.) **Preferences by Mongolian gerbils for solutions of sugars, acids, and salts in Richter-type tests.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 79-

86.—Preferences for solutions of 4 sugars, 2 acids, and 3 salts were recorded in 48-hr, 2-bottle drinking tests (test fluid opposite distilled water) with Mongolian gerbils. Each chemical was presented at 5 concentrations to a different group. Peak acceptances were shown for the sugars at .5 and 1 M, the highest concentrations used. The acids, ranging from 2.3–1.5 pH, were rejected. In the range .0005–1 M, an indifference-aversion curve was obtained for each salt. The results were compared with those reported for other species. (18 ref.)—*Author abstract*.

407. Kumar, R. (University Coll., London, England) **Effects of fear on exploratory behavior in rats.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 205–214.—Analyzed the relationship between conditioned fear and exploratory behavior in 3 experiments with 92 female hooded rats. There was no evidence that mild fear increased exploration. Conditioned fear was found to be under relatively precise stimulus control and its magnitude was related to the intensities and durations of UCS, inescapable electric shock. (21 ref.)—*Journal abstract*.

408. Lal, Harbans & Zabik, Joseph. (U. Rhode Island) **Increased food consumption in thirsty rats after water satiation: Inhibition by salts.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 131–132.—30 adult male Sprague-Dawley thirsty rats gradually learned to eat excessively after water satiation. The excessive eating subsequent to water consumption was antagonized by 1 M NaCl injection (ip) but not by an injection of distilled water.—*Journal abstract*.

409. Prytula, Robert E. & Braud, William G. (Middle Tennessee State U.) **Consequences of absolute and relative qualitative and quantitative sucrose-incentive reductions in the albino rat.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 843–853.—Reports 4 experiments involving relative qualitative (Exp. I and II), relative quantitative (Exp. III), and absolute quantitative (Exp. IV) sucrose-solution incentive reductions in the 1st goal box (GB) of a double runway (RW). Ss were 96 male albino Cheek-Houston rats. In the 3 relative experiments, different GB₁ amounts (.50 vs. .10 cc) or concentrations (32 vs. 8%) of sucrose did not affect pre- or postshift locomotion speeds in either runway. In the absolute study, RW₁ speeds varied directly, and RW₂ speeds varied inversely, with GB₁ reward magnitude (.50 vs. NR). Postshift RW₂ speed changes favored a demotivation rather than a frustration interpretation of incentive change. (20 ref.)—*Journal abstract*.

410. Stricker, Edward M. & Wilson, Nancy E. (McMaster U., Hamilton, Ontario, Canada) **Salt-seeking behavior in rats following acute sodium deficiency.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 416–420.—48 male Wistar rats learned to avoid salty-tasting fluids completely when ingestion was associated with aversive aftereffects. Nevertheless, Ss resumed drinking salty solutions following acute sodium depletion by subcutaneous formalin injection. Increased thirst elicited by injected hypertonic NaCl solution did not disrupt the learned aversion, nor did formalin treatment disrupt a learned aversion to a nonsalty solution. Results suggest that sodium-deficient Ss do not select salty fluids serendipitously. Instead, it seems Ss have a strong drive to seek and ingest salt that precedes the reinforcement associated with taste stimulation or postingestional sodium repletion. This motivation overwhelmed Ss' memories of the aversive

postingestional consequences of drinking salty fluids. (20 ref.)—*Journal abstract*.

411. Voss, Stephen C. & Homzie, M. J. (U. Virginia) **Choice as a value.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 912–914.—24 naive male albino Sprague-Dawley rats permitted to locomote to a goal box via 1 of 2 major arms of a maze, preferred the alternative which provided the opportunity for further choice behavior. Choice as a value is discussed.—*Journal abstract*.

414. Milner, A. D. & Ettlinger, G. (Inst. of Psychiatry, London, England) **Cross-modal transfer of serial reversal learning in the monkey.** *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 251–258.—Trained 12 monkeys on 2 separate series of 20 reversals. Different stimulus dimensions were relevant in each of the series so that any facilitation between series could not be the result of transfer of response to a dimension. In the experimental group, 4 Ss learned the 1st series through touch in the dark, and the 2nd through vision in the light; another 4 were trained in the converse order. 4 other Ss (the control group) learned both series visually. There was evidence for improvement within each series of reversals in both experimental and control groups, and of transfer between the 2 visual series in the control group. On the other hand, only slight evidence for transfer between sense-modalities was found, and this is interpreted to be the result of nonspecific effects. (French & German summaries)—*Journal abstract*.

Conditioning

415. Askew, Henry R. (Fordham U.) **Effects of stimulus intensity and intertrial interval on habituation of the head-shake response in the rat.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 492–497.—Investigated the effects of stimulus intensity and ITI on habituation and retention of habituation of the head-shake response in 15 male albino Holtzman rats using a 3 × 5 within-Ss factorial design. Both independent variables had major effects on habituation of the head-shake response. It is concluded that habituation of the head-shake response was due to both a short-term decremental process that occurred within single trials and took approximately 100 sec. to recover, and a long-term decremental process that occurred across trials and showed only 70–80% recovery after a 30-min rest period. (20 ref.)—*Journal abstract*.

416. Grevert, Priscilla & Moore, John W. (U. Massachusetts) **The effects of unpaired US presentations on conditioning of the rabbit's nictitating membrane response: Consolidation or contingency.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 177–179.—32 New Zealand White rabbits were run in an experiment that showed interference of nictitating membrane conditioning with presentation of 1 UCS alone between each paired trial. This conclusion was based on comparisons with yoked controls with the same

number of paired trials, but no UCS-alone trials. Differences between experimental and control Ss were most pronounced at a comparatively short ITI, supporting J. D. Papsdorf and N. M. Kettlewell's (see PA, Vol. 42:2246) consolidation theory over R. A. Rescorla's (see PA, Vol. 42:15211) contingency hypothesis. Previous results indicating that, prior to the appearance of the first CR, the UCR on UCS-alone trials progressively decreases in amplitude in relation to UCR amplitude on paired trials are discussed.—*Journal abstract.*

417. Siegel, Shepard. (McMaster U., Hamilton, Ontario, Canada) **Retention of latent inhibition.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 161-162.—Attempted to determine whether or not latent inhibition (the deleterious effect of preconditioning exposure to the CS on subsequent acquisition) was attenuated by interpolating a delay between the last session of preconditioning exposure to the CS and the 1st session of acquisition. Independent groups of preexposed male New Zealand White rabbits were given classical eyelid conditioning either immediately following their 550th CS-alone presentation, or 24 hr. after their 550th CS-alone presentation. Control Ss had no experience with the CS prior to acquisition. Preexposed Ss were slower to acquire the CR than were controls, replicating previous reports of latent inhibition in the eyelid conditioning situation. Furthermore, the magnitude of latent inhibition was unaffected by the interpolation of a delay interval between preexposure and acquisition.—*Journal abstract.*

419. Yehle, Arthur L., Spaulding, Lionel E., & Hsiu-Ying, Lai. (Memphis State U.) **Classical discrimination conditioning and reversal in the albino rabbit.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 187-188.—Trained 8 New Zealand albino rabbits in a classical discrimination conditioning task measuring heart rate and nictitating membrane responses. Following 10 days of acquisition, reversal training was carried out for 10 days. The nictitating membrane response indicated a successful discrimination reversal within 3 days, while the heart rate response never showed discrimination reversal during the entire period.—*Journal abstract.*

Discrimination

420. Elias, Merrill F. (Duke U., Medical School, Center for the Study of Aging & Human Development) **Differences in reversal learning between two inbred mouse strains.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 179-180.—12 DBA/2J and 12 C56BL/6J mice were given original learning and 11 reversals of a spatial discrimination habit. The former strain required fewer trials to shift from incorrect to correct responding after a reversal and made fewer errors on reversals. Data suggest that (a) genetic characteristics contribute to differences in reversal learning, and (b) generalizations concerning phyletic differences in reversal learning may be premature prior to testing of diverse strains within species.—*Journal abstract.*

421. Hammond, L. J. & Daniel, Ralph. (Temple U.) **Negative contingency discrimination: Differentiation**

by rats between safe and random stimuli. *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 486-491.—After initial training to bar press for water reinforcement on a variable interval (VI) schedule, 8 Sprague-Dawley rats were exposed to safe stimuli, random stimuli, and brief shocks during 30 later VI sessions. Then all Ss were exposed to more conventional conditioned suppression procedures during sessions in which both formerly random and formerly safe stimuli terminated with a brief shock 50% of the time. During both phases, each S showed greater suppression to the formerly random than to the formerly safe stimuli. Since only a negative contingency differentiated the 2 stimuli in their relationship to shock, it can be argued that the discrimination observed is based on Pavlovian conditioned inhibition rather than an interaction between inhibition and excitation. (15 ref.)—*Journal abstract.*

422. Hearst, Eliot. (U. Missouri) **Discrimination learning as the summation of excitation and inhibition.** *Science*, 1968 (Dec), Vol. 162(3859), 1303-1306.—Gave white Carneaux pigeons (7-9 in each group) either excitatory, inhibitory, or combined excitatory and inhibitory (intradimensional) training to discriminate line-tilt stimuli. Algebraic summation of relative-generalization gradients obtained after separate excitatory and inhibitory training sessions was used to predict characteristics of gradients after intradimensional training. The close agreement between obtained and predicted gradients provided support for gradient-interaction theory. (15 ref.)—*Journal abstract.*

423. Muntz, W. R. (U. Sussex, Lab. of Experimental Psychology, England) **An experiment on shape discrimination and signal detection in octopus.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 82-90.—Trained 10 octopuses to perform a successive discrimination between two shapes. After 7 days of training, transfer tests were given with other shapes that were either rotations or parts of the original shapes. Transfer tests suggest that the discrimination was performed in terms of component parts of shapes and their relationship to the shape as a whole. During successive discrimination training the general attack level varied between Ss, and fluctuated from day to day. There were often more attacks on both the positive and negative shapes on some occasions, making it difficult to compare the levels of discrimination achieved. It is suggested that the concepts of signal detection theory can help overcome this difficulty. Attacks on the positive shape plotted against attacks on the negative shape constitute a receiver operating characteristic curve from which a value of d' , independent of the general attack level, can be obtained. (18 ref.)—*Journal abstract.*

424. Stimbert, Vaughn E. (U. Tennessee, Child Development Center, Memphis) **A comparison of learning based on social or nonsocial discriminative stimuli.** *Psychonomic Science*, 1970 (Aug), Vol. 30(3), 185-186.—2 groups of 6 female albino Sprague-Dawley rats each were trained to run across an open-field maze with 4 choice-point alternatives. For 1 group the correct response was based upon a social discriminative stimulus and for the other it was based upon a nonsocial discriminative stimulus. Results indicate that social responses were learned faster and were more durable under extinction conditions than were responses based on nonsocial stimuli.—*Journal abstract.*

425. Waller, T. Gary. (U. Waterloo, Ontario, Canada) **Facilitation of an extradimensional shift with over-**

training in rats. *Psychonomic Science*, 1970 (Aug), Vol. 21(3), 172-174.—32 male albino Holtzman rats were trained to criterion or given overtraining beyond criterion on an orientation discrimination (left vs. right oblique stripes). 16 Ss in Exp. I were then transferred to a discrimination between 2-dimensional shapes (cross vs. triangle). 16 Ss in Exp. II were transferred to a width discrimination (wide vs. narrow vertical stripes). Position of the positive cue was the only variable irrelevant dimension in either phase of either experiment. Overtraining on the orientation discrimination improved performance on the shape discrimination but did not affect performance on the width discrimination. Several explanations are offered and implications for attention theories of discrimination learning are discussed.—*Journal abstract*.

Avoidance & Escape

426. Allen, Joseph D. & Mitcham, Judson C. (U. Georgia) **The time course of fear incubation following single-trial passive-avoidance training.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 169-170.—Obtained the time course of fear incubation by measuring single-trial passive-avoidance latencies in an alley following postshock training delays of 1, 2, 4, 6, 12, 24, or 60 hr. for different groups of 35 male Holtzman rats. The function relating mean running latency and postshock delay interval was increasing and negatively accelerated, reaching a maximum at 24 hr. Some problems with relating the different incubation functions derived by a single-trial passive-avoidance procedure vs. an active-avoidance procedure are discussed. (15 ref.)—*Journal abstract*.

427. Grigg, Peter. (Johns Hopkins U., Medical School) **Lever holding and avoidance in the rat, with constant current and constant voltage UCS.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 133-134.—Gave 94 male hooded rats lever-press avoidance trials with constant current (CC) or constant voltage (CV) UCS. A wide range of intensities of CC and CV shock were used to train groups of 10 Ss each. A lever-holding response appeared as an increasing function of intensity of CC but not of CV shock.—*Journal abstract*.

428. Klein, Stephen B. & Spear, Norman E. (Rutgers State U.) **Reactivation of avoidance-learning memory in the rat after intermediate retention intervals.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 498-504.—108 naive female albino Sprague-Dawley rats acquired a conflicting aversive-conditioning task more rapidly after an intermediate retention interval than either immediately or 24 hr. after original learning. Retention of the avoidance response was facilitated when inescapable shocks were presented prior to the intermediate-interval (2½-hr) test, although this treatment did not affect either the memory of the avoidance of Ss tested at the extreme intervals or the acquisition performance of naive Ss. Results suggest that the retention deficit often found after intermediate retention intervals is due to the Ss' failure to retrieve the memory of original learning. The enhanced retention found when shocks immediately preceded the intermediate-interval test was due to reactivation of the memory attributes of original training. (17 ref.)—*Journal abstract*.

429. Levis, Donald J. (U. Iowa) **Serial CS presentation and shuttlebox avoidance conditioning: A**

further look at the tendency to delay responding. *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 145-147.—Exp. I, with 72 male hooded rats, compared the effects of nonserial and serial CS presentations, while Exp. II with 90 Ss, compared nonserial and serial compound CS presentations on the acquisition of Ss' avoidance responses in a shuttlebox situation. The avoidance-response latencies of Ss presented the serial CS conditions tended to be delayed until after the onset of the last stimulus segment introduced into the sequence. This was not the case for the nonserial Ss who tended to avoid shortly after the onset of the CS-UCS interval. The delay in responding noted for the serial CS Ss occurred when either 2 or 3 stimuli comprised the sequence and when either serial or serial compound presentation was employed. Serial compound conditions increased avoidance responding, but the serial condition did not. Other effects of CS complexity on avoidance responding were also reported.—*Journal abstract*.

430. Levis, Donald J., Bouska, Sally A., Eron, Joseph B., & Mellon, Michael D. (U. Iowa) **Serial CS presentation and one-way avoidance conditioning: A noticeable lack of the delay in responding.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 147-149.—Compared 7 different CS conditions on the acquisition and extinction of avoidance responses in a 1-way situation in 96 male hooded rats. 3 of the groups received nonserial CS manipulations comprising 1, 2, or 3 components; 2 received straight serial CS presentations, comprising either 2 or 3 components; and 2 received serial compound CS conditions comprising either 2 or 3 components. The groups did not differ reliably on 5 different acquisition indices. The extinction data did produce reliable differences between combined serial and nonserial CS conditions with the serial CS conditions producing greater resistance to extinction. Reliable differences were not found between serial and serial compound conditions or between number of CS components. The tendency for the avoidance response to be delayed for the serial CS conditions which is characteristic of shuttlebox data was noticeably absent. The majority of responses for both serial and nonserial CS conditions occurred close to the onset of the CS-UCS interval. The differences between 1-way and shuttlebox avoidance situations is discussed.—*Journal abstract*.

431. Masterson, Fred A. (U. Delaware) **Is termination of a warning signal an effective reward for the rat?** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 471-475.—Male Wistar rats (N = 24) did poorly in the conventional bar-press avoidance situation where an avoidance response produced termination of a warning signal (WS). By contrast, Ss achieved near-perfect performance when WS offset was augmented by the opening of a door leading to a safe place. This superior performance was not due to any facilitative effect of handling during the ITI. Nor can the poor performance in the conventional bar-press situation be attributed to an insufficient quantity of stimulus change produced by WS offset. Results support the view that WS offset is not an effective reward for the rat. Other possible sources of reward are discussed.—*Journal abstract*.

432. Robustelli, Francesco; Geller, Anne, & Jarvik, M. E. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Biphasicity of the incubation curve.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 129-130.—In Exp. I, different groups of naive female CF1 albino mice

(N = 192) were retested at different times after training, in a 1-trial passive avoidance task. In Exp. II, with 182 Ss, different groups were administered a footshock outside the conditioning apparatus and then were given the step-through experience at different times after the footshock. The time-response curve was found to be biphasic only in Exp. I, while it produced a monotonic incubation curve in Exp. II.—*Journal abstract.*

433. Tsai, Loh S. & Dexter, George E. (California State Coll., Fullerton) **Reinforcing "displaced aggression" and dominance hierarchy in white rats.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 97-105.—After dominance hierarchies were established in 7 groups of 4 male rats each, the Number 2 and 4 ranking Ss were each placed in a shocking device with either a tranquilized or a smaller S. As soon as S attacked the scapegoat, shock was turned off. 40 spaced trials of such reinforcement training failed to raise the aggressive level or hierarchy status as objectively determined in the Tsai dominance-submission apparatus. Rats in both solitary shock and nonshock control groups did not show any significant hierarchical changes either. Displaced aggression in Miller's rats and those in the present investigation was interpreted as an instrumental CR of the escape-training type to terminate the shock.—*Journal summary.*

Reinforcement

434. Cilluffo, Anthony F. (U. South Carolina) **Runway performance as a function of consummatory and non-consummatory goal box behavior.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5253.

435. Meyer, Merle E., Couden, Barbara N., & Westford, Karen L. (Western Washington State Coll.) **Light increment and decrement as sensory reinforcers for domestic chicks.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 923-926.—Used 3 intensity levels of light increment and decrement treatment conditions with appropriate yoked controls to investigate the functional relationship between stimulus change and its reinforcing properties for 240 domestic chicks. Results substantiated light increment as an effective sensory reinforcer; however light decrement had no demonstrable reinforcing properties.—*Journal abstract.*

436. Wallace, Robert B. (Boston U.) **Comparison of two techniques for the assessment of conditioned reinforcement in the runway.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 87-96.—5 groups of 14 Sprague-Dawley male albino rats each were trained under different schedules of continuous and partial primary reinforcement to traverse a straight alleyway and obtain food in a goal box of a fixed brightness. Following acquisition each of the groups was split in half, $\frac{1}{2}$ undergoing extinction in the alleyway for 4 days while the other $\frac{1}{2}$ was tested for 1 day in a T maze. In general the partial schedules of primary reinforcement led to the development of more durable conditioned reinforcement with the discriminative schedules being the most effective of all. The 2 assessment procedures led to equivalent ordering across the training conditions.—*Journal summary.*

Reinforcement Schedule

437. Clarke, Bonnie M., Price, Ronald D., & Lippman, Louis G. (Western Washington State Coll.) **A note on**

variability of infrahuman FI performance. *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 139-140.—Reported an adventitious finding of 1 Sprague-Dawley rat's unusually high rate of responding on fixed-interval (FI) schedules. S's idiosyncratic mediation of interreinforcement intervals indicates that an FI schedule does not invariably lead to low-rate, scalloped performance in infrahumans.—*Journal abstract.*

438. Pear, Joseph J. & Wilkie, Donald M. (U. Manitoba, Winnipeg, Canada) **Behavioral contrast in mixed schedules of reinforcement.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 167-168.—Tested 2 male albino rats for behavioral contrast on 2-component mixed schedules of reinforcement. Results suggest that contrast occurs in mixed variable-interval extinction schedules when the frequency of reinforcement in the variable-interval component is high.—*Journal abstract.*

439. Stimbert, Vaughn E. (U. Tennessee, Medical Units, Memphis) **Partial reinforcement of social behavior in rats.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 723-726.—Studied the effects of partial reinforcements on a social response in 2 groups of 2 female albino Sprague-Dawley rats. 1 group was trained to follow other Ss through an open-field maze on a continuous schedule and the other on a partial (50%) schedule. Ss having partial reinforcement training performed at a higher level during extinction than those trained under continuous reinforcement. Results extend reinforcement schedule effects to animal social behavior.—*Journal abstract.*

440. Zimmerman, Donald W. (Carleton U., Ottawa, Ontario, Canada) **Patterns of responding in second-order chained schedules.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 137-139.—Responding on 1 lever under a fixed-interval schedule (FI = 100 sec.) produced an exteroceptive stimulus and responding on another lever under a different schedule (FI = 50 sec. or fixed ratio —FR—1) terminated the stimulus. Under a 2nd-order schedule, every 2nd termination of the stimulus produced primary reinforcement (FR 2 of entire sequence). Ss were 4 Sprague-Dawley male albino rats. Patterns of responding in the initial component of the chain were similar to those maintained by presentation of brief stimuli in 2nd-order schedules. When the schedule in the terminal component was changed and primary reinforcement became less frequent, rate in the initial component decreased, while pattern of responding under the 2nd-order schedule was maintained.—*Journal abstract.*

Punishment & Extinction

441. Burdick, Charles K. & James, J. P. **Spontaneous recovery of conditioned suppression of licking by rats.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 467-470.—Conditioned 84 naive male Holtzman rats to suppress water licking during a preaversive stimulus. Following 40 massed extinction trials, different groups, 12 Ss each, were tested for spontaneous recovery of conditioned suppression after .058 (3.5 min.), .5, 1, 3, 24, or 72 hr. A negatively accelerated curve, increasing to a maximum at 24 hr., related the degree of spontaneous recovery to the postextinction interval. Response suppression that appeared to be conditioned to the apparatus cues also exhibited some spontaneous recovery from extinction.—*Journal abstract.*

442. Byrum, Ronald P. & Jackson, Donald E. (Eastern Michigan U.) **Reinforcement and response factors in the extinction of conditioned suppression.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 143-144.—Following CER training, 32 male Sprague-Dawley rats began initial CER extinction under: (a) normal (lever present); (b) yoked with normals (lever absent); (c) nonoperative lever; or (d) no-lever/no-water conditions. After 4 days, CER extinction continued with lever returned for all Ss. Analysis of suppression ratios indicated that water availability was the major factor differentiating groups.—*Journal abstract*.
443. Church, Russell M., Wooten, Carol L., & Matthews, T. James. (Brown U., Walter S. Hunter Lab. of Psychology) **Contingency between a response and an aversive event in the rat.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 476-485.—During the signal of a discriminative punishment procedure there is an increase in the frequency of occurrence of aversive events and an increase in the contingency between a response and the aversive event. These factors contribute to the magnitude of suppression produced by discriminative punishment (Exp. I). The response suppression during a signal indicating an increase in the contingency between a response and an aversive event can result from a reaction to the last punishment rather than from an anticipation of the next punishment (Exp. II and III). Ss were 60 naive male albino Norway rats.—*Journal abstract*.
444. Davidson, Robert S. (Veterans Administration Hosp., Miami, Fla.) **Conditioned punishment and conditioned negative reinforcement on a multiple schedule.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 163-165.—2 male Sprague-Dawley rats, earlier trained in multiple variable interval (VI) 1 VI 1 (clicker plus reinforced response shock), were exposed to increasing intensity shock until their punished rates were $\frac{1}{3}$ or less of their unpunished rates. At this point, the clicker (discriminative stimulus for shock) was made to sound for 2 sec. following each response in the shock-free components. This condition resulted in conditioned punishment (suppression of nonshock response rate). The contingency was then reversed, such that the clicker sounded in the absence of responding and each response terminated the clicker for 2 sec. Increased response rates resulted (conditioned negative reinforcement). Control rates were recovered through a final reversal to the training condition.—*Journal abstract*.
445. Dragoin, William B. (George Peabody Coll. for Teachers) **Conditioning and extinction of taste aversions with variations in intensity of CS and UCS in two strains of rats.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5255.
446. Fixen, Dean L., McBee, Susan S., Campbell, Patrick E., & Crumbaugh, Charles M. (U. Kansas) **N-length and intertrial reward.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 1007-1013.—Investigated the effects of intertrial reward on resistance to extinction following partial reward schedules containing N-lengths (number of consecutive nonrewards preceding a rewarded trial) of 1, 2, or 3 with 45 female Sprague-Dawley rats. Intertrial rewards eliminated the PRE for all N-lengths when run times were considered but had no effect on goal times. Data are discussed in terms of relevance to the modified aftereffects hypothesis and previous investigations of intertrial reward.—*Journal abstract*.
447. Martin, R. Chris; Ragland, Evelyn, & Melvin, Kenneth B. (U. Missouri, Kansas City) **Self-punitive locomotor behavior in the Mongolian gerbil.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 183-184.—Tested the generality of a behavioral phenomenon across species. Several investigations have shown that rats when punished for an aversively motivated response will maintain that response rather than abandon it. Similar treatments revealed that 14 male Tumblebrook Mongolian gerbils also showed such self-punitive behavior. Special characteristics of the gerbil are noted.—*Journal abstract*.
448. Pratt, Linda K. & Ludvigson, H. Wayne. (Texas Christian U.) **The role of odor in latent extinction.** *Psychonomic Science*, 1970 (Aug), Vol. 20(3), 189-190.—Hypothesized that an apparent latent extinction effect can result from Ss' reaction to their own odor excreted during prior placements. 4 groups of 10 female Sprague-Dawley rats each were given 28 runway acquisition trials followed by 4 1-min latent extinction placements. 2 groups received placements in the empty goalbox. For 1 of these groups, the goalbox was cleaned before extinction to remove odor cues; for the other group, it was not cleaned. 2 additional groups received placements in a neutral box. 1 of these groups entered a clean goalbox on the 1st extinction trial, while the other entered a goalbox that (presumably) contained any odors emitted by another S during placement. Both the odor and site-of-placement variables produced a latent extinction effect in the goal-entry speeds, suggesting that latent extinction is a genuine phenomenon but that an apparent latent extinction effect from a response to residual odor is readily obtainable.—*Journal abstract*.

SOCIAL & SEXUAL BEHAVIOR

449. Barlow, G. W. & Breen, R. F. (U. California, Berkeley) **The problems of appeasement and of sexual roles in the courtship behaviour of the blackchin mouthbreeder, *Tilapia melanotheron* (Pisces: Cichlidae).** *Behaviour*, 1970, 36(1-2), 85-115.—Tests were made to determine the adequacy of the appeasement and arousal models of reproductive behavior. This was done, in part, by determining species-typical size relationships between courting fish, and by noting behavioral differences between sexes. Correlational data showed that 3 behavioral elements considered central to courtship—nodding, tail-beating, and quivering—varied together both between- and within-sex and accounted for most of the significant correlations. When the relative size of the pair was analyzed it was found that with a large male the small female did most of the courting, when the pair were about the same size they courted about equally, and when the female was large the smaller male did most of the courting. The data provide for some support for both hypotheses as well as providing information helpful in deciding what constitutes courtship behavior. (German summary)—S. R. Goldstein.
450. Beach, F. A. (U. California, Berkeley) **Coital behaviour in dogs: VIII. Social affinity, dominance and sexual preference in the bitch.** *Behaviour*, 1970, Vol. 36(1-2), 131-148.—Attempted to determine the consistency of the bitches' preference for males in sexual and nonsexual situations. This was accomplished by tests designed to measure social affinity, relative social dominance, and mating preference. It was found that

nonestrous bitches exhibited a marked selectivity to different males, that in general females tend to be subordinate to males, that females show unmistakable sexual preferences, and that tests of social affinity and social dominance bear no obvious relationship to sexual preference. "Males differ with respect to... precopulatory activities and this may contribute to the females sexual preferences." (French summary)—S. R. Goldstein.

451. Dewsbury, Donald A. & Bolce, Sally K. (U. Florida) **Effects of prolonged postejaculatory intervals on copulatory behavior of rats.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 421-425.—Performed 2 experiments to examine the effects of relatively short prolongations of the 1st postejaculatory interval (PEI) of 21 male Long-Evans rats on subsequent copulatory behavior. Prolonged PEIs produced a superfacilitation of interintromission intervals which was maximal immediately after resumption of copulation. The effect dissipated by the last interintromission interval preceding the 2nd ejaculation. Prolonged PEIs following the 1st series produced reliable increases in PEIs following the 2nd series.—*Journal abstract*.

452. Firsov, L. A. (Inst. of Physiology, Leningrad, USSR) **Golosovoe povedenie u nizshikh i vysshikh obez'yan.** [Vocal behavior in lower monkeys and apes.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 113-125.—Describes and classifies the vocalizations of capuchin monkeys and chimpanzees, and presents examples of voiceprints. Presentation of tape-recorded feeding, aggression, or exploratory sound to food-deprived chimpanzees for 10 min. affected their blood sugar level and white corpuscle count in a predictable manner for the next 3 hr. This effect did not occur with neutral sounds or with no stimulation. (English summary) (26 ref.)—L. Zusne.

453. Gärtner, K. (U. Frankfurt, W. Germany) **Zur Bildung von Schlafgesellschaften bei Laboratoriums-ratten.** [Sleeping groups in laboratory rats.] *Zeitschrift für Tierpsychologie*, 1970 (Feb), Vol. 27(1), 78-81.—Male Sprague-Dawley rats, 200-250 gm. body weight, were caged in groups of 4-21 animals. According to motion pictures taken for 10 sec. every hour for 14-18 days, Ss slept in groups of 3, 6, 9, or 15 animals; the size of the sleeping groups was independent of the number of caged animals. Frequently the sleeping groups consisted of the same animals. Every rat was found to prefer 1 or 2 individuals of the population in the formation of sleeping groups.—*English summary*.

454. Goldfoot, David A. & Goy, Robert W. (Rotterdam Medical Faculty, Netherlands) **Abbreviation of behavioral estrus in guinea pigs by coital and vagino-cervical stimulation.** *Journal of Comparative & Physiological Psychology*, 1970 (Sep), Vol. 72(3), 426-434.—The display of lordosis by an estrous female guinea pig in response to manual stimulation of the rump or in response to mounting by a male is terminated by the experience of coitus. Ss were 50 intact and 118 ovariectomized female guinea pigs. Without the experience of coitus, lordosis can be elicited repeatedly for 6-8 hr. when S is in either spontaneous or induced estrus. Mechanical stimulation of the vagina and/or cervix by a glass rod duplicates the abbreviating effects of coitus. Moreover, abbreviation of the receptive period by either coital or mechanical stimulation is independent of the ovary, of the amount of estrogen and progesterone used to induce lordosis, of the pituitary, and of the amount of

pituitary hormone injected during estrus. Results suggest that the inhibitory effects of vagino-cervical stimulation are neurally mediated and hormonal mechanisms are not necessary for the influence of the sensory experience. (36 ref.)—*Journal abstract*.

455. Hazlett, B. A. (U. Michigan) **Tactile stimuli in the social behavior of Pagurus bernhardus (Decapoda, Paguridae).** *Behaviour*, 1970, Vol. 36(1-2), 20-48.—A series of experiments were carried out to determine the type of stimuli controlling general agonistic, shell fighting, and sexual behavior of a common species of hermit crab. Using cheliped flicks and dislodging-shaking as indices of general agonistic behavior, it was found that high levels of illumination inhibit tactile-induced cheliped flicking, while dislodging-shaking was released by applied weight in a complex manner related to the size of the crab. Shell fighting behavior appeared to be jointly controlled by shell weight, shell volume, and animal size such that crabs fought for a larger shell when the volume of an occupied shell was too small, but fought for a smaller shell when the weight of an occupied shell was too great. Tactile contact with the female's body was found to be a major releaser of male sexual behavior. The various results are discussed in terms of their survival value to the species. (German summary) (40 ref.)—S. R. Goldstein.

456. Morrell, G. M. & Turner, J. R. (U. York, England) **Experiments on mimicry: I. The response of wild birds to artificial prey.** *Behaviour*, 1970, Vol. 36(1-2), 116-130.—The response of free-ranging birds to artificial prey was recorded to test the Batesian theory of mimicry. The theory states that species resembling avoided unpalatable prey are themselves avoided. The key tests stimuli consisted of a red unpalatable pastry prey model in addition to other mimics differentially resembling the model. The results show that the birds learned to avoid the unpalatable model and the mimic most closely resembling it. The evidence that birds discriminate and generalize supports the Batesian theory and suggests a means by which differential selection for perfect mimicry may proceed. (German summary) (23 ref.)—S. R. Goldstein.

457. Weygoldt, P. (Albert Ludwigs U., Freiburg, W. Germany) **Courtship behaviour and sperm transfer in the giant whip scorpion, Mastigoproctus giganteus (Lucas) (Uropygi, Thelyphonidae).** *Behaviour*, 1970, Vol. 36(1-2), 1-8.—Describes the courtship, sperm transfer, and spermatophore morphology in this scorpion. The courtship pattern exhibits basic differences during and after spermatophore formation. The phylogenetic implications of behavioral and morphologic similarities between this and other arachnids are discussed. (German summary)—S. R. Goldstein.

SENSORY PROCESSES

458. Miller, W. H., Bernard, G. D., & Allen, J. L. (Yale U., Medical School) **The optics of insect compound eyes.** *Science*, 1968 (Nov), Vol. 162(3855), 760-767.—S. Exner's classical theory of the function of compound eyes with crystalline tracts ignores the presence of the tracts for the dark-adapted eye. The tracts perform an optical function in the eyes of certain moths and skippers whether light- or dark-adapted. The lenslet of the corneal-crystalline cone focuses an image at the beginning of the tract. Although the image is not transmitted, theory predicts that some information about

the image could be guided to the rhabdom. The tract and migrating pigment together also function as a longitudinal pupil. Also, compound eyes contain dioptric components with characteristic dimensions smaller than a wavelength of light. Corneal nipples act as an antireflection coating that aids camouflage and may reduce ghosts. The specialized layering in corneas of certain dipterans probably serves a contrast-filtering function for vision. Tracheolar interference filters of lepidopterans act as tapeta that may enhance both sensitivity and the optical contrast of the retinal image. (31 ref.)—*Journal summary.*

DEVELOPMENTAL PSYCHOLOGY

459. Gardner, Howard. (Harvard U.) **Children's sensitivity to painting styles.** *Child Development*, 1970 (Sep), Vol. 41(3), 813-821.—Devised a match-to-sample task to determine whether children are sensitive to the styles of various painters. No significant differences were found in the performances of 20 1st, 90 3rd, and 20 6th graders, but 20 9th graders scored significantly better than younger Ss. On items where subject matter provided no cues, no significant differences were found between the highest and lowest scoring grades. Where subject matter could be misleading, the oldest Ss performed significantly better. More effective problem-solving strategies, increased familiarity with art objects, and the ability to overlook subject matter and focus on aspects of technique are suggested as possible reasons for the superior performance of adolescents. Factors contributing to style sensitivity are suggested, and the problem of measuring such sensitivity is discussed.—*Journal abstract.*

460. Joffe, J. M. (Stanford U., Medical School, Palo Alto, Calif.) **Prenatal determinants of behaviour.** New York, N.Y.: Pergamon, 1969. xii, 366 p.

461. Laungani, Devika. (Hatfield Polytechnic, England) **Verbal conditioning and previously learned habits.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 35-42.—Ss were secondary school children. In Exp. I, following a Taffel-type task the pronouns "I and We" were reinforced. The results showed that there was a significant increase in "I" responses but there was no increase in "We" responses. In Exp. II, only the pronoun "We" was reinforced. The results were unexpected. Not only was there no significant increase for "We" responses but there was a significant increase for "I" responses. Since the pronoun "I" occurs most frequently and the pronoun "You" occurs with the least frequency, these 2 pronouns were eliminated in Exp. III and only 4 pronouns "We, She, He, They" appeared on cards. Ss were divided into 4 groups. Group 1 was reinforced for "We" responses, Group 2 was reinforced for "He" responses, Group 3 was reinforced for "They" responses, and Group 4 was reinforced for "She" responses. There was a significant increase for pronouns "We" and "They" but there was no effect of reinforcement on pronouns "He and She." Results of all experiments demonstrate that previously learned habits seem to exercise greater influence on the choice of pronoun than the experimental reinforcement.—*Author abstract.*

462. Malmquist, Carl P. **Conscience development.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 301-331.—Explores the process of acquiring a conscience as a developmental phenomenon, emphasizing developmen-

tal observations and clinical material of children until the age of 6 yr. The implications for later normal and pathological functioning are discussed. Current theoretical issues, i.e., the cognitive or affect-based theory of controls are elaborated. Emphasizes the need for understanding the vicissitudes of normal conscience development from infancy in order to comprehend the diverse clinical syndromes with conscience defects. The origins of conscience are discussed in relation to the oedipal period. The emergence of guilt as a phenomenon is viewed as indicating the establishment of a delineated and functioning superego in its idealized and prohibitory aspects. (31 ref.)—*Journal summary.*

464. Rees, Ann H. & Palmer, Francis H. (City Coll., Graduate Center, City U. New York) **Factors related to change in mental test performance.** *Developmental Psychology*, 1970 (Sep), Vol. 3(2, Pt. 2), 57 p.—Related demographic and family background factors to level and change in mental test performance of children assessed at 6, 12, and 17 yr. old in 5 longitudinal studies. Ss were from predominantly white, English-speaking families of relatively high socioeconomic status (SES). Average IQ was 1 standard deviation above the mean of the standardization population. Level and change in test scores were strongly related to SES. Birth order and sex and age of siblings also related to test behavior. Content and style of response to TAT cards showed consistent associations to the dependent variable. Most associations were stronger for boys than for girls. Results are discussed in terms of factors mediated by social class and sex role that might generate found differences.—*Journal abstract.*

INFANCY

469. Lewis, Michael; Wilson, Cornelia D., Ban, Peggy, & Baumel, Marcia H. (Educational Testing Service.

Princeton, N.J.) **An exploratory study of resting cardiac rate and variability from the last trimester of prenatal life through the first year of postnatal life.** *Child Development*, 1970 (Sep), Vol. 41(3), 799-811.

—Obtained resting cardiac rate and variability for 21 Ss. Maternal cardiac rate and variability were also obtained. Data indicate no relationship between maternal and fetal or infant data. Moreover, there are clear developmental patterns of resting cardiac response over the 1st yr. of life, with rate and variability showing linear decreases. —*Journal abstract.*

470. McCall, Robert B. & Nelson, William H. (Fels Research Inst., Yellow Springs, O.) **Amount of short-term familiarization and the response to auditory discrepancies.** *Child Development*, 1970 (Sep), Vol. 41(3), 861-869.—Gave 27 5½-mo-old boys 4, 8, or 12 presentations of a standard 8-note tonal sequence prior to the introduction of a series of discrepancies formed by the sequential rearrangement of these same 8 notes. Cardiac deceleration to the discrepancies relative to the preceding standard stimuli increased as a function of the number of familiarization trials with the standard. This result was not simply due to increased habituation to the standard by the well-familiarized groups. In addition, there was an inverse relationship ($-.70$) between the magnitude of cardiac change elicited by visual and auditory discrepancies such that Ss who displayed large decelerations to visual stimuli responded only minimally to analogous auditory discrepancies and vice versa. This effect appeared to be directly linked to the discrepancies per se and was not simply a function of the arousal potential of the stimulus modality in general. —*Journal abstract.*

475. Herbert, John. **Direct observation as a research technique.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 127-138.—Examines the viability of direct observations as a research technique. A review of the literature indicates that approximately 8% of the studies in child development used some type of system-

atic observation. It is suggested that recent improvements in technical devices (tape recorders, cameras, video tapes, etc.) may accelerate the use of direct observation.—*H. Kaczowski.*

476. Hiller, Robert E. (U. Tennessee) **The stimulus value of attention and approval: A comparison of two social stimuli.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5257.

477. Katz, Phyllis A., Karp, Barry, & Yalisove, Daniel. (City Coll., City U. New York) **Verbal mediation of children's perception: The role of response variables.** *Journal of Experimental Psychology*, 1970 (Sep), Vol. 85(3), 349-355.—Assessed the effects of linguistic pre-differentiation of stimuli on 96 1st and 6th grade children's perceptual judgments, discrimination learning, and recognition behavior. A factorial design with stimuli at 2 levels of similarity was used. Findings indicate that distinctive labeling training elicited the greatest degree of perceptual modification for the younger Ss with highly similar stimuli. The performance of the 6th grade Ss with similar and dissimilar stimuli was relatively unaffected by labels. Perceptual judgment tasks appeared most sensitive and recognition tasks least sensitive to linguistic influence for younger Ss. Intercorrelations between tasks were fairly low, even under control conditions, suggesting that the various tasks are not tapping overlapping processes. (16 ref.) —*Journal abstract.*

478. Knox, Carol & Kimura, Doreen. (U. California, Santa Barbara) **Cerebral processing of nonverbal sounds in boys and girls.** *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 227-237.—Presented verbal and nonverbal tasks dichotically to 263 5-8 yr. olds in 4 experiments. More nonverbal environmental sounds were correctly identified from the left than from the right ear. In contrast, a number of verbal tasks reproduced a previously-demonstrated right-ear superiority for the perception of speech sounds. The greater left-ear scores for nonverbal stimuli suggests that cerebral lateralization for such auditory functions may be present by age 5. Nonverbal method of report did not affect the right-ear superiority for verbal tasks. Boys correctly identified significantly more dichotic nonverbal sounds (environmental sounds and animal sounds) than did girls. This male superiority on a nonverbal task was also found with nondichotic presentation of animal sounds to 2-5 yr. old children. (French & German summaries) (20 ref.) —*Journal abstract.*

(c) ambidextrousness, (d) moderate right-handedness, and (e) extreme right-handedness. Differences between the age groups in the degree of lateralization were examined and the results compared with those of Passian, et al. who, using the same method, had studied 464 girls of the same age range. Also analyzed were those subtests which contributed most to the classification of hand preference. Results were: (a) Only extreme right-handedness is statistically related to age in boys. (b) Significant sex differences were found with respect to right-handedness and ambidextrousness. (c) The classification into different groups of hand preference clearly depends on the methods used. It is suggested that the observed sex differences predominantly depend on sociocultural conditions by learning processes and are not a sign of biological sex difference. porary group of eight year old children studied in different parts of the world. *Monographs of the Society for Research in Child Development*, 1969, Vol. 34(1), 93 p.—Reviews and integrates findings on body size from 300 samples of 8-yr-old children. "The samples are heterogeneous geographically, and fairly homogeneous secularly; they were drawn primarily between 1950-1960 in numerous regions of the earth. The samples have been described racially, socioeconomically and in many instances with respect to diet, health care, and features of the geographic locality. Each somatic variable has been discussed with regard to procedures in data collection, methodological limitations in comparison of studies and cautions required in drawing valid conclusions. Group findings have been reported for tribes and nations, provinces and islands, recent migrants and hybrids. Sample size varies from over 20,000 for a few groups to less than 30 for a few others. For samples of reasonable size, subgroup findings are reported from subdivision by social class, quinquennium of data collection, and urban-rural residency."—*A. Barclay.*

487. Miller, Scott A., Shelton, Jev, & Flavell, John H. (U. Minnesota) *A test of Luria's hypotheses concerning the development of verbal self-regulation*. *Child Development*, 1970 (Sep), Vol. 41(3), 651-665.—20 girls and 20 boys in each of 4 age groups (mean ages = 3.2 yr., 3.7 yr., 4.1 yr., and 4.11 yr.) received 1 of 4 self-instruction conditions in A. R. Luria's 2-choice task. 1 group at each age level performed the motor task only (silent responding). In the remaining 3 conditions, Ss overtly instructed themselves with either "squeeze" to the positive stimulus, "don't squeeze" to the negative stimulus, or self-instructions to both stimuli. Motor task performance improved with age. Contrary to Luria's hypotheses, the self-instruction conditions did not interact with age. Verbal responding did not facilitate motor behavior at any age. Specific comparisons derived from Luria's reports also were not supported. In addition, despite explicit instructions to the contrary, the motor response tended to precede speaking for all Ss at all ages. Rather than a useful mediator of motor performance, verbal responding appeared to be only an additional task for the child.—*Journal abstract.*

491. McGraw, Myrtle B. (Briarcliff Coll.) **Major challenges for students of infancy and early childhood.** *American Psychologist*, 1970 (Aug), Vol. 25(8), 754-756.—Sensory deprivation and social studies of underprivileged children have contributed to the current interest in early childhood. The importance of early learning is discussed and it is suggested that established theories of learning are not adequate guidelines for the type of growth that takes place during the 1st 3 or 4 yr. of life. A major challenge to researchers in this field is the formulation of theories encompassing the phenomena of a constantly changing organism, the human infant. Since these theories often influence social practices of child management, students of early childhood should be aware of the way in which their pronouncements are adopted into the culture.—*Author abstract.*

492. Menchinskaya, N. A. & Saburova, G. G. **Problema obucheniya i razvitiya.** [The problem of learning and development.] In A. A. Smirnov (Ed.), *Voprosy detskoi i pedagogicheskoi psikhologii na XVIII Mezhdunarodnom kongress psikhologov.* (See PA, Vol. 45:1) 57-105.—Presents a critical survey of the papers read at the Congress on the interrelationships of learning and development.—*J. D. London.*

494. Stevenson, Harold W., Friedrichs, Ann G., & Simpson, William E. (U. Minnesota) **Interrelations and correlates over time in children's learning.** *Child Development*, 1970 (Sep), Vol. 41(3), 625-637.—Tested 73 Ss in the 4th grade and retested them in the 7th grade on paired-associate learning, discrimination learning, incidental learning, verbal memory, and anagram tasks. In addition, 138 7th graders were tested on these tasks for the 1st time. Intercorrelations among tasks decreased with increasing age. Significant correlations were obtained between performance on these tasks and IQ, achievement test scores, and school grades. Using performance in 4th grade to predict performance on different tasks in 7th grade often was more satisfactory than using 7th grade predictors. Results point to the necessity of analyzing performance on the basis of process rather than structure.—*Journal abstract.*

495. Thomas, Barbara J. (George Peabody Coll. for Teachers) **Differential effects of task-difficulty, IQ, and motivational orientations on children's concept identification learning.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5229.

496. Tighe, Louise S., Tighe, Thomas J., Waterhouse, Mark D., & Vasta, Ross. (Dartmouth Coll.) **Dimensional preference and discrimination shift learning in children.** *Child Development*, 1970 (Sep), Vol. 41(3), 737-746.—Assessed dimensional preference (either height or brightness) in 112 5.10-7 yr. olds either before (Group I) or after (Group II) performance on an optional shift task. For Group I, Ss assigned their preferred dimension in the initial discrimination learned more rapidly than Ss assigned their nonpreferred dimension. For Group II, there was no relation between speed of learning and assignment to preferred vs. nonpreferred dimensions. There was no relation between type of optional shift selected and assignment to preferred vs. nonpreferred dimensions in either Group I or II. Results suggest that prior preference tests may

spuriously inflate relations between dimensional preference and discrimination learning.—*Journal abstract.*

498. Vanevery, Harolyn & Rosenberg, Sheldon. (Ball State U.) **Semantics, phrase structure, and age as variables in sentence recall.** *Child Development*, 1970 (Sep), Vol. 41(3), 853-859.—Gave 40 1st grade and 40 7th grade Ss 4 study-test trials on lists of 4 sentences. $\frac{1}{2}$ the Ss at each age level were given semantically well-integrated (SWI) sentences to learn, while the other $\frac{1}{2}$ were given semantically poorly integrated (SPI) sentences. For all measures of recall, the SWI sentences were recalled better than the SPI sentences regardless of age. The words in SWI sentences were recoded into larger chunks for storage than words in SPI sentences, and age tended to increase chunking for both SWI and SPI sentences. As anticipated, the only evidence for phrase chunking was found in the 7th grade Ss who were exposed to SPI sentences.—*Journal abstract.*

Concepts & Language

499. Ayabe, Harold L. (Indiana U.) **The effect of reflective and impulsive training on conceptual tempo.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4820.

500. Baptiste, Hansom P. (Indiana U.) **The effect of an equilibrated methodology on the acquisition of the concept—conservation of quantity.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4821.

501. Cole, Michael; Gay, John; Glick, Joseph, & Sharp, Donald. (U. California, Irvine) **Linguistic structure and transposition.** *Science*, 1969 (Apr), Vol. 164(3875), 90-91.—Studied transfer of a learned discrimination along the size dimension in groups of 72 nursery school American and 160 4-8 yr. old illiterate and 1st grade African tribal children. The language spoken by the African Ss contained an asymmetry in the expression of size comparisons that is not present in English. Contrary to theories of linguistic mediation of choice behavior, transfer choices were not related to the differing linguistic patterns; however, initial choices and posttest descriptions of choices were so related.—*Journal abstract.*

502. Mackay, C. K., Fraser, Joan, & Ross, Isabel. (U. Aberdeen, Scotland) **Matrices, three by three: Classification and seriation.** *Child Development*, 1970 (Sep), Vol. 41(3), 787-797.—Investigated in 2 experiments the development of the ability for double seriation in 90 5-8 yr. olds and found a developmental lag between the emergence of the ability for cross-classification and that for double seriation. This result is considered to have implications beyond that of revising age norms. An attempt is made to relate it to the differences existing between the Geneva and Harvard approaches to interpreting cognitive growth.—*Journal abstract.*

503. McLeod, John & Anderson, Jonathan. (U. Saskatchewan, Saskatoon, Canada) **An approach to assessment of reading ability through information transmission.** *Journal of Reading Behavior*, 1970 (Spr), Vol. 2(2), 116-143.—Describes a series of experiments designed to obtain an empirical estimate of the word redundancy of printed English. 1 in 8 words found

redundant by efficient readers were deleted from 14 prose passages selected from a variety of books ranging in difficulty from graduate level to 2nd grade. 8 of the passages were presented to samples of 40-50 children in Grades 3-7, and obtained redundancy estimates were used as a standard against which to compare the remaining passages, which were presented in pairs to independent samples from the same populations. A similar procedure was carried out with passages from children's books. In both cases a linear relationship resulted when the logarithms of relative uncertainty reductions were plotted against each other. When these passages were administered as a test to 500 4th grade Australians, the resulting linear relationship between uncertainty reduction and raw score suggested that "for groups of readers at any rate, uncertainty reduction is as valid an index of achievement on a cloze-type reading test as is raw score." A subsequently derived Uncertainty Reduction Index was examined on the basis of results from various populations in Australia and Canada, and it is concluded that "a reliable and valid expression of reading ability can be obtained... from the method." (37 ref.)—R. Wiltz.

504. Miller, Patricia H., Kessel, Frank S., & Flavell, John H. (U. Minnesota) **Thinking about people thinking about people thinking about...: A study of social cognitive development.** *Child Development*, 1970 (Sep), Vol. 41(3), 613-623.—Traced the growing understanding of the recursive, or self-embedded, nature of thinking, e.g., "He is thinking that she is thinking that he is thinking..." 72 1st-6th graders described line drawing representations of talking and thinking like those used in comic strips. Both group performance and the scalability of individual Ss indicate a 4-step developmental sequence: (a) thinking about contiguous people, (b) thinking about action (talking), (c) thinking about thinking, and (d) thinking about thinking about thinking. Performance improved with increasing grade level. Results are discussed in terms of differences in the formal structure of the 4 steps and the development of role-taking skills.—*Journal abstract*.

505. Peglar, Marian. (Iowa State U.) **A comparison of operational seriation of lengths and weights in Piagetian tasks.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5227.

506. Peters, Donald L. (Pennsylvania State U.) **Verbal mediators and cue discrimination in the transition from nonconservation to conservation of number.** *Child Development*, 1970 (Sep), Vol. 41(3), 707-721.—Studied the role of verbal mediators of comparison and cue discrimination through the use of multiple regression techniques and an aptitude/treatment interaction (ATI) model. 4 groups of kindergartners (N = 131) were pretested on number, difference, and area conservation, as well as on comprehension of the language of comparisons and cognitive style. 3 groups received either noncued, visually cued, or verbal rule supplemented instruction. The 4th received no training. Results indicate verbal training superior to the others on immediate learning, and both verbally and the visually cued treatments significantly better than the control on delayed retention. Both the language level and analytic sorting behavior of Ss were found to be reliable predictors of number conservation performance. The ATI analyses suggest a compensatory notion of instruction with Ss high in language comprehension benefiting most from visually cued training and analytic

Ss benefiting most from the verbal training. (31 ref.)—*Journal abstract*.

507. Rystrom, Richard. (U. Georgia, Coll. of Education) **Toward defining comprehension: A second report.** *Journal of Reading Behavior*, 1970 (Spr), Vol. 2(2), 144-157.—Presents preliminary data indicating the extent to which a previously published comprehension model accurately reflects the reading comprehension process. The Rystrom Reading Comprehension Test (RRCT), consisting of a series of multiple-choice questions on a previously read story, was administered to 57 4th grade remedial readers and 112 "typical" 4th graders. Remedial readers were split into 2 groups, and normal readers were in 4 groups of roughly equal numbers. With odd-even reliability coefficients ranging from .70-.98 for the 6 groups, the test correlated from .84-.91 with the California Reading Test for the 4 normal groups. Both remedial groups were found to obtain lower mean scores than any of the normal groups. Further analysis indicates that the RRCT is highly valid and reliable, that the previous model appears to define comprehension, that the most important skill appears to be the ability to remember specific facts from what was read, and that many programs may be over-emphasizing vocabulary and under-emphasizing more important skills.—R. Wiltz.

508. Schroth, Marvin L. (Santa Clara U.) **The effect of informative feedback on problem solving.** *Child Development*, 1970 (Sep), Vol. 41(3), 831-837.—Investigated the effects of informative feedback on a matching task with 3 combinations of verbal feedback and 3 levels of task complexity. The 3 types of feedback were right-wrong (R-W), nothing-wrong (N-W), and right-nothing (R-N). The 3 levels of task complexity were defined in terms of number of irrelevant stimulus dimensions. 180 1st graders were Ss in which nonsense shapes served as stimuli. Over all 3 levels of task difficulty the R-W condition yielded significantly better performance than the other feedback conditions and N-W resulted in a faster rate of learning than R-N.—*Journal abstract*.

509. Schwartz, Marilyn M. & Scholnick, Ellin K. (U. Maryland) **Scalogram analysis of logical and perceptual components of conservation of discontinuous quantity.** *Child Development*, 1970 (Sep), Vol. 41(3), 695-705.—Explored the role of stimulus factors and logical judgments in conservation of discontinuous quantity using 2-choice, nonverbal discrimination tasks. 40 53-76 mo. old preschoolers estimated the amount of candy in 2 containers under conditions varying the relative diameters of the containers (identical or different) and the type of judgment required (direct comparison, identity, and equivalence estimates). The tasks formed a Guttman scale. The easiest items involved identical containers. There was a significant interaction between stimulus setting and judgments. When identical containers were used, identity judgments were least accurate, but when the 2 containers differed, identity was easiest followed by equivalence and comparison judgments. (18 ref.)—*Journal abstract*.

510. Sedarat, Nassir & Otto, Wayne. (Illinois Wesleyan U.) **Response consensuality and reading ability of intellectually superior pupils.** *Journal of Reading Behavior*, 1969 (Sum), Vol. 1(3), 32-40.—40 5th and 6th graders with IQs of 120 or above were given 50 stimulus words in a 2 x 2 factorial with reading achievement as measured by the reading subtest of the

Stanford Achievement Test and sex as the independent variables. Results based on the degree to which responses were in agreement with word associations of other Ss indicate no significant differences between groups. These results are contrary to predictions that (a) good readers would give more consensual responses than poor readers, and (b) girls would give more consensual responses than boys. Results are suggested to be a function of the superior students' ability to anticipate task constraints.—R. Wiltz.

511. Serafica, Felicissima C. & Sigel, Irving E. (Clark U.) **Styles of categorization and reading disability.** *Journal of Reading Behavior*, 1970 (Spr), Vol. 2(2), 105-115.—Administered the Sigel Cognitive Styles Test, consisting of pictures representing human, food, vehicle, furniture, and tool categories, to 24 2nd-4th grade boys with a history of reading disability and to 28 4th graders with no reading problem. Each of 35 sets of pictures contained 3 items from 3 differing categories, and Ss chose 2 categories which were alike and indicated the reason for his choice. Responses were classified into descriptive part-whole, descriptive-whole, relational-contextual, or categorical-inferential categories on the basis of predetermined criteria. The hypothesis that boys with reading disability use less descriptive part-whole responses was not confirmed. Also contrary to expectations it was found that nonreaders used significantly less descriptive-whole responses. However, the hypothesis that nonreaders use more relational-contextual responses was supported. It is concluded that "the major differences between nonreaders and readers in the sample were in their conceptual and integrative abilities." (21 ref.)—R. Wiltz.

512. Wright, Byron W., Gloniger, Margaret F., & Keeve, J. Philip. (U. Pittsburgh, Graduate School of Public Health) **Cultural deprivation: Operational definition in terms of language development.** *American Journal of Orthopsychiatry*, 1970 (Jan), Vol. 40(1), 77-86.—Investigated the ability to name common vegetables among 52 4-6 yr. old kindergartners from an urban poverty area with the ability of 33 4-6 yr. olds from a private school. Findings show that private kindergarten Ss were exposed to a wider variety of a selected array of vegetables. However, the experience of both groups in terms of number of different vegetables eaten was substantially the same. When the number of vegetables seen or eaten was held constant for the 2 groups, the poverty Ss were less able to name the vegetables with which they had had experience. The efficiency of naming ability appeared to be developing at a significantly faster rate among the private school Ss. Findings indicate that the concept "cultural deprivation" must account for deficiencies in experience and for deficiency in the conditions of learning. (21 ref.)—A. M. Berg.

520. Rowland, G. Thomas & McGuire, Carson. **The development of intelligent behavior: VII. Irving E. Sigel.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 139-145.—Examination of the writings of Sigel indicates that his concepts of representational competence and distancing although similar to the ideas present in the writings of Piaget, Bruner, Werner, and Kaplan are unique contributions to understanding the origins of intelligent behavior. It is suggested that these concepts could modify teaching strategies predicated on the representational mode.—H. Kaczowski.

521. Sakulina, N. **Vospitanie tvorcheskoi intsilativy.** [Training of creative initiative.] *Doshkol'noe Vospitanie*, 1970 (Jan), Vol. 43(1), 39-44.—Discusses the development in 3-5 yr. old children of various components of creativity in drawing (activity, independence, and initiative), and methods for promoting the development of initiative.—I. D. London.

522. Shapiro, Bernard J. & O'Brien, Thomas C. (Boston U.) **Logical thinking in children ages six through thirteen.** *Child Development*, 1970 (Sep), Vol. 41(3), 823-829.—In assessing the difference between the

ability to recognize and the ability to test for logical necessity, statistically significant and substantial differences were found favoring the former with 48 Ss at each age level, 6-13 inclusive. In recognizing logical necessity, Ss had little difficulty, this ability leveling off high in the 6-8 yr. age range. Although there was growth over the 8-yr period in testing for logical necessity, there was no evidence of any high leveling off. Data support the authors' previous research with younger children and challenge certain implications made in earlier studies on hypothetico-deductive reasoning in children.—*Journal abstract.*

523. Snyder, R. T. & Gaston, Diane S. (Prince George's County Board of Education, Upper Marlboro, Md.) **The figure drawing of the first grade child: Item analysis and comparison with Koppitz norms.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 377-383.—Human figure drawings were obtained from 680 1st graders. It was found that the Koppitz norms reported a higher level of figure drawing ability in almost every category studied. It was noted that in general 6 yr. olds do not produce much from a developmental viewpoint, that there was a wide variability of performance within a single drawing, and that it is difficult to predict what items should be expected. Differences between data of this study and Koppitz' data are presented. "Psychologists are strongly encouraged to use available norms in interpretation rather than subjective data based on theory or clinical acumen alone."—E. J. Kronenberger.

Perception

531. Messer, Stanley. (Rutgers State U., Psychological Clinic) **The effect of anxiety over intellectual performance on reflection-impulsivity in children.** *Child Development*, 1970 (Sep), Vol. 41(3), 723-735.—Hypothesized that anxiety over the quality of one's intellectual performance would influence the disposition of children to be impulsive or reflective in a problem-solving task. 60 3rd graders served as Ss. Anxiety was aroused experimentally by having Ss fail in an intellectual task, and its effects on decision time and errors on a match-to-sample task were assessed. The induced anxiety resulted in longer decision times for both impulsive and reflective Ss, and in fewer errors for impulsives who increased in response time. The hypothesis is supported. (23 ref.)—*Journal abstract.*

532. Rolph, Herman. **On an early genital phase: With an addendum on genesis.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 348-365.—Proposes that a normal genital phase frequently occurs in children 18-24 mo. old. Early castration anxiety and reactions are seen to develop when the following 3 conditions are present: (a) early genital arousal, (b) early observation of anatomical sex differences, and (c) endurance of experiences which produce instability. Case histories are presented to illustrate each of the above conditions. (22 ref.)—B. A. Stanton.

Social Behavior

533. Bocharova, V. Igry reb  nka v sem'e. [The play of a child in the family.] *Doshkol'noe Vospitanie*, 1970 (Feb), Vol. 43(2), 103-106.—Describes and analyzes the play activities of a little girl in her home over a 3-yr period, starting at the age of 3 yr. I. D. London.

534. Bryan, James H. & Walbek, Nancy H. (Northwestern U.) **The impact of words and deeds concerning altruism upon children.** *Child Development*, 1970 (Sep), Vol. 41(3), 747-757. Exposed 72 2nd, 3rd, and 4th grade girls to a videotaped adult model (M) who practiced either generosity or selfishness, and who either preached generosity or selfishness, or held a neutral conversation. For 1/2 of the Ss within each of these 6 groups, the M was the E (the high-powered M). The effect of M's practices upon S's donation behavior was marginally significant ($p < .10$), but donation behavior was unaffected by either the power or exhortations of M. Attractiveness of the M was a function of the M's acts, while there was no interaction between M's words or deeds and either donation, response latencies, or attraction. (17 ref.)—*Journal abstract.*

535. Flanders, James P., Thistlethwaite, Donald L. (Bowling Green State U.) **Effects of informative and justificatory variables upon imitation.** *Journal of Experimental Social Psychology*, 1970 (Jul), Vol. 6(3), 316-328.—Examined the influence of vicarious reinforcement, verbalization by the model of his own acts, and task difficulty upon imitation in 120 11-13 yr. olds. Presence of verbalization resulted in both greater

comprehension and greater acceptance of the modeled act. A Verbalization \times Vicarious reinforcement interaction indicated that presence of verbalization increased imitation in the vicarious reinforcement, but not in the nonreinforcement treatment. Exposure to modeling on a discrimination task of low difficulty produced both greater comprehension and greater imitation than exposure to modeling on tasks of high difficulty. Results are interpreted in terms of a theoretical viewpoint postulating that comprehension and acceptance are both antecedents to the behavioral disposition to imitate a model. (23 ref.)—*Journal abstract*.

536. Gozall, Joav. (U. Wisconsin, Milwaukee) **Comments on social desirability and persuasion.** *Child Development*, 1970 (Sep), Vol. 41(3), 897-898.—Suggested that high social desirability of children reared in highly structured environment can be interpreted as a function of their active participation in persuasive activities.—*Journal abstract*.

537. Liebert, Robert M. & Fernandez, Luis E. (State U. New York, Stony Brook) **Effects of vicarious consequences on imitative performance.** *Child Development*, 1970 (Sep), Vol. 41(3), 847-852.—Examined the effects of vicarious reward and punishment upon 24 6-7 yr. old girls' imitation of the commodity preferences of a female adult model. Consistent with the hypothesis that Os use vicarious consequences to infer what their own outcomes are likely to be, Ss exposed to vicarious reward showed more spontaneous imitation than those who had seen the model perform without consequences, whereas Ss exposed to vicarious punishment showed less imitation than controls. In contrast, the previously divergent experimental groups performed equally well when explicitly asked to reproduce the model's responses. Although the controls had also seen the model perform, they were able to reproduce fewer responses than the experimental groups on this 2nd test. Results are discussed in terms of the informational analysis on which the study was based.—*Journal abstract*.

540. Halverson, Charles F. & Waldrop, Mary F. (National Inst. of Mental Health, Child Research Branch, Bethesda, Md.) **Maternal behavior toward own and other preschool children: The problem of "ownness."** *Child Development*, 1970 (Sep), Vol. 41(3), 839-845.—Explored the interactions between mothers and their own and other 2½ yr. olds to identify maternal behaviors which were consistent across children and those which were closely tied to individual children. A structured interaction session was designed to obtain data on mother-child interactions for 42 preschool children. Results indicate that while maternal behavior tended to be consistent with both children, mothers used significantly more positive, encouraging statements with other children and significantly more negative sanctions with their own children. Mothers of girls talked more than mothers of boys. Also, boys rated as aggressive in the nursery school had mothers who gave more negative,

controlling statements to their sons than they did to other children.—*Journal abstract*.

541. Landauer, T. K., Carlsmith, J. Merrill, & Lepper, Mark. (Stanford U.) **Experimental analysis of the factors determining obedience of four-year-old children to adult females.** *Child Development*, 1970 (Sep), Vol. 41(3), 601-611.—Assessed the importance of several potential factors in producing natural variation in child obedience between 1 adult-child dyad and another. 58 3- and 4-yr-old nursery school children were asked to perform tasks by their own and other mothers. There was no consistency across children in the ability of mothers to command obedience. There was a slight, marginally significant consistency across mothers in the tendency of children to obey. However, obedience was strongly determined by the preexisting relationship between adult and child. 44 of 52 children were less obedient to their own mothers.—*Journal abstract*.

543. Meerlo, Joost A. **The psychological role of the father.** *Child & Family*, 1968 (Spr), Vol. 7(2), 102-116.—Discusses the psychological impact of the father on the emotional development of the child, and re-examines the father's role in light of American society where women have become more powerful and men more submissive. The father is seen as the bridge by which the child reaches the outside world and 2 case histories are presented which show what can happen when there is no father or a weak father figure who cannot make this bridge. It is concluded that the motivation for self-assertion and self-awareness and being come from the disciplining father. (25 ref.)—*J. L. Ahlberg*.

544. Munro, A. & Griffiths, A. B. (U. Birmingham, England) **Further data on childhood parent-loss in psychiatric normals.** *Acta Psychiatrica Scandinavica*, 1968, Vol. 44(4), 385-400.—Interviewed 100 16-60 yr. old medical outpatients to obtain information on childhood bereavement experiences in psychiatrically normal individuals. Results show that: (a) 15% of the Ss had lost a parent by death before the 16th birthday and 37.2% by the 25th birthday; (b) 32% had been separated from a parent for at least 3 mo. during childhood for a cause other than death; (c) considering all causes of separation, 44% had undergone parental bereavement in childhood; (d) 13% reported having been distressed at the loss of the parent; and (d) 14% reported a disturbed relationship with a parental figure not associated with bereavement. Although results were not significant, the use of a psychological test, the Fould Personal Illness Inventory, suggests that the complaining characteristics of a group of psychiatric normals may be influenced to some extent by early life experiences. Findings confirm that parental deprivation is a common experience in the general population, and it is suggested that future investigations concentrate on measuring the quality of the deprivation experience to demonstrate its significance in the etiology of psychiatric illness.—*Journal summary*.

545. Schmidt, Wilfred H. & Hore, Terence. (U. Alberta, Edmonton, Canada) **Some nonverbal aspects of communication between mother and preschool child.** *Child Development*, 1970 (Sep), Vol. 41(3), 889-

896.—Studied patterns of communication, both verbal and nonverbal, between mothers and their 5-yr-old children (15 low, 15 high socioeconomic status—SES—dyads), as they were engaged on 2 cooperative tasks. 1 task was of a practical-manipulative nature, and the other consisted of making up stories from pictures. All sessions were videotaped. 3 nonverbal variables were isolated: physical contact, body inclination, and glances. Physical contact was more prevalent in the low SES group. On body inclination, seen as a measure of degree of closeness, there was no difference. A significant pattern was revealed in glancing behavior. The high SES mothers tended to look at their children more than low SES mothers and high SES children had fewer glances unreciprocated by their mothers. (23 ref.)—*Journal abstract*.

546. Sutton-Smith, Brian & Rosenberg, B. G. (Teachers Coll., Columbia U.) **The sibling**. New York, N.Y.: Holt, Rinehart, & Winston, 1970. ix, 198 p. \$7.50.

ADOLESCENCE

547. Adams, Paul L. (U. Florida) **Puberty as a biosocial turning point**. *Psychosomatics*, 1969 (Nov), Vol. 10(6), 343-349.—Investigates the "growth spurt, rites of passage and the end of sexual innocence" associated with puberty. Puberty is presented as a paradox in that it manifests significant biosocial changes, but is "not accorded much importance by our society." (37 ref.)—G. Steele.

548. Blos, Peter. **Character formation in adolescence**. *Psychoanalytic Study of the Child*, 1968, Vol. 23, 245-263.—Proposes that character formation is synonymous with adolescence. The functions of character are discussed as homeostatic mechanisms which stabilize ego identifications, self-esteem, self-concept, and reactions to external stimuli. 4 developmental preconditions are discussed in detail as being necessary for adolescent character formation: relinquishing infantile object ties, assimilation of residue from early childhood trauma, ego continuity, and sexual identity. (30 ref.)—B. A. Stanton.

549. Bozhovich, L. I. & Blagonadzhina, L. V. **Voprosy psikhologii vospitaniya**. [Problems in the psychology of upbringing.] In A. A. Smirnov (Ed.), *Voprosy detskoi i pedagogicheskoi psikhologii na XVIII Mezhdunarodnom kongresse psikhologov*. (See PA, Vol. 45:1) 106-183.—Presents a critical survey of the papers read at the Congress on personality formation, particularly that of adolescents.—I. D. London.

550. Brown, Stephen W. (Mississippi State U.) **A comparative study of maternal employment and non-employment to delinquency, intelligence, achievement, personality development, and social maladjustment among eighth and ninth grade males in five junior high schools of Dallas County, Texas**. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4708-4709.

551. Erikson, Erik H. (Harvard U.) **Reflections on the dissent of contemporary youth**. *International Journal of Psycho-Analysis*, 1970 (Jan), Vol. 51(1), 11-22.—Different periods of history open different conflicts to psychoanalysis. An attempt is made here to formalize the place and function of youth historically in the life cycle and in present unrest. The epidemiology of an era is related to the individual's conflicts. Today's Marxist's see the youth as the proletariat; today's Gandhian sees the youth as victims of colonialism and

violence. Erickson coins "revolt of the dependent" for today's unrest as the dependent are exploited. Adolescence theoretically recapitulates earlier stages. When these become independent stages in themselves the term "totalization" is used. Hippiedom is a totalization of the oral stage. Amoralism is related to the anal stage. Public use of excrement and "pig" usage belong here. Charismatic leaders and utopian causes belong to the phallic stage. Pragmatic moralists who work within the system are the "school and play" stage. When the present young learn to assume responsibility for the younger ones then perhaps a different model of youth and adulthood will emerge.—J. Chyatte.

552. Evans, Ellis D. (Ed.) (U. Washington) **Adolescents: Readings in behavior and development**. Hinsdale, Ill.: Dryden, 1970. xv, 523 p.—Provides for students a convenient source of representative material from current developments in adolescence research and theory. Contributions by various authors include the following: (a) theoretical and conceptual foundations of adolescent behavior and development, (b) contemporary issues in socialization and development during adolescence, and (c) a sampling of research on adolescents.

554. Goldman, Ronald. (Didsbury Coll. of Education, Manchester, England) **Angry adolescents**. Beverly Hills, Calif.: Sage, 1969. xiii, 119 p. \$4.95.

555. Kremer, Malvina W. (New York Medical Coll.) **What are the relevant facts of life for adolescents?** *Child & Family*, 1968 (Feb), Vol. 7(4), 361-364.—Examines the facts appropriate for presentation to different age groups concerning the anatomical and physiological aspects, the facts of human sexual intercourse, and the more difficult aspects to teach in the socio-psycho-sexual levels. "The basic requirements of affection, consideration, empathy, mutuality, and nonexploitativeness" are stressed.—G. Steele.

556. Levandovskii, N. G. (Pedagogical Inst., Leningrad, U.S.S.R.) **O strukture kharaktera**. [On the structure of personality.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 51-61. Personality ratings, self-ratings, and interviews with parents were combined to rate 40 personality traits of 29 9th and 10th graders over a 2-yr period. Factor analysis yielded 3 factors which did not correspond to the initial tentative classification of the 40 traits into 5 groups. All traits loaded significantly on at least 1 factor. The factors were identified as general activity, self-control, and interpersonal relations. Temperament pervades all 3 personality aspects and cannot be said to constitute just a component of personality. While personality traits show their own dynamics, temperament is the underlying innate basis that influences the particular manifestation of any and all traits. (English summary) (16 ref.)—L. Zusne.

557. Light, Harriett K. (North Dakota State U.) **Attitudes of rural and urban adolescent girls toward selected concepts**. *Family Coordinator*, 1970 (Jul), Vol. 19(3), 225-227. Examined the attitudes of 164 rural and 161 urban adolescent girls toward family, religion, peer groups, premarital sex, ethnic prejudice, morality, and education. Ss were matched on age (16-17 yr old), grade in high school (juniors-seniors) and socioeconomic status (middle class). Each S was given a questionnaire consisting of 45 statements with 5 choices for responding to each. Data were analyzed using chi-square. Results

show highly significant differences between rural/urban girls toward family, religion, morality, premarital sex, and education: (a) family and religion are more likely to influence attitudes of rural than urban girls; (b) rural girls continue to accept conventional ethical standards, urban girls are more receptive to new morality; and (c) rural girls place greater value on education than do urban girls.—*M. W. Linn.*

558. Men'shchikova, M. A. (Inst. of Psychology, Moscow, USSR) *K kharakteristike obshchekul'turnykh interesov sovetskoi uchashcheysya molodezhi.* [General cultural interests of Soviet school-age youth.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 86-93.—Results of a survey conducted among 2000 10th graders in various regions of the Soviet Union showed serious interest in the political, economic, and cultural life of the country. Urban-rural and sex differences were found. The data indicate, however, a decrease in the urban-rural differential. (English summary)—*L. Zusne.*

560. Walther, Clarence J. (U. Oregon) *An investigation of paired associate learning within and across intelligence levels and sense modalities.* *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4842-4843.

ADULTHOOD & OLD AGE

561. Busse, Ewald W. & Pfeiffer, Eric. (Eds.) (Duke U., Medical School) *Behavior and adaptation in late life.* Boston, Mass.: Little, Brown, 1969. xii, 395 p. \$13.50.—Presents important basic information on how people adapt to growing old. Contributions by various authors concerning aging include such topics as sociological aspects, the economics and ambiguity of retirement, health experience and living arrangements, sexual behavior, facing death, functional psychiatric disorders, intellectual and cognitive changes, organic brain syndromes, institutional care and community services, training geropsychiatry, and the aged and public policy.

SOCIAL PSYCHOLOGY

562. Granberg, Donald O. (Pennsylvania State U.) *Adaptation of psychophysical and psychosocial judgments to shifts in stimuli.* *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5066.

563. Hall, Dennis & Rummel, R. J. (U. Hawaii) *The patterns of dyadic foreign conflict for 1963.* *Multivariate Behavioral Research*, 1970 (Jul), Vol. 5(3), 275-293.—Delineated 5 patterns of dyadic foreign conflict behavior for 1963: (a) negative communication, (b) violence intensity, (c) warning and defensive acts, (d) negative sanctions, and (e) unofficial incidence of violence. These patterns are contrasted with those delineated in previous study of foreign conflict behavior in 1955 to establish any stability of patterns, and dyads with similar profiles are used to define a taxonomy of dyadic conflict behavior for 1963.—*Journal abstract.*

564. Wagatsuma, Hiroshi. (U. Pittsburgh) *Major trends in social psychology in Japan.* *American Behavioral Scientist*, 1969 (Jan), Vol. 12(3), 36-45.—Uses

H. Minami's review of Japanese social psychology, 1946-1960, as a basis for a discussion of developments after 1960. The "impressionistic nature of the study of modal personality" is criticized. The investigation of national character includes subjective impressions, opinion surveys, and cross-cultural studies. Group dynamics and person perceptions are primarily experimental. It is felt that attitude and opinion survey techniques are "one of the better developed areas of social research." Studies of mass communication, culture, and entertainment; applied social psychology; and prejudice are discussed. It is concluded that: (a) the experimental area fails to deal with culture variables, and (b) the theoretical area is primarily an attempt to weld American and Marxian theory into a Japanese tool to "implement a social revolution." (3 p. ref.)—*G. Steele.*

CULTURE & SOCIAL PROCESSES

565. Feaster, J. Gerald. (U. Nebraska) *Measurement and determinants of innovativeness among primitive agriculturists.* *Rural Sociology*, 1968 (Sep), Vol. 33(3), 339-348.—Investigated the innovativeness of "shifting cultivators," who were Mayan Indians in British Honduras. Attitude statements were used to construct both an innovation and a traditionalism scale. It was assumed that those favoring the statements in the innovation scale were implicitly expressing a willingness to internalize values demanded by a nontraditional agriculture, and those scoring positively in the traditionalism scale were apathetic toward changes in their way of life. In general, the shifting cultivators had favorable attitudes toward innovation. Results of multiple regression analyses show that age, education, level of living, contact with extension agents, and aspirations were significant variables related to the modification of traditional attitudes.—*Journal abstract.*

566. Harp, John & Gagan, Richard J. (Cornell U.) *Changes in rural social organizations: Comparative data from three studies.* *Rural Sociology*, 1969 (Mar), Vol. 34(1), 80-85.

567. Klineberg, Otto. *Ressources offertes par la psychologie expérimentale pour l'étude du caractère national.* [Resources offered by experimental psychology in the study of national characteristics.] *Revue de Psychologie Des Peuples*, 1969 (Sep), Vol. 24(3), 224-230.—Discusses the possible contributions by application of experimental psychology in studies of national traits and characteristics. Several instances where identical studies applied to different nationalities yielded a surprising lack of similarity in reaction are cited. Experimental psychology is suggested as a means of verifying certain set hypotheses and determining the relationship between various factors and causes.—*I. Sirotin.*

Ethnology

568. Hofman, John E. & Debbiny, Sami. (Hebrew U., Haifa, Israel) *Religious affiliation and ethnic identity.* *Psychological Reports*, 1970 (Jun), Vol. 26(3), 1014.—12 Christian and 25 Moslem 11th grade boys in Israel rated 5 ethnic stereotypes including "me" (self) on a 25-scale form of the semantic differential. D-matrices of inter-concept distances formed a hierarchical order of stereotypes suggesting that these Christian and Moslem Arabs identify primarily with religious and national dimensions, respectively.—*Author abstract.*

569. Kubany, Edward S., Gallimore, Ronald, & Buell, Judith. (U. Hawaii) The effects of extrinsic factors on achievement-oriented behavior: A non-Western case. *Journal of Cross-Cultural Psychology*, 1970 (Spr), Vol. 1(1), 77-84.—Filipino-Hawaiian high school boys were asked to perform a task either privately or in the E's presence. Striving to do well was stressed. As was predicted, Ss in the public condition showed more achievement-oriented behavior. This is discussed in terms of a distinction between intrinsic and extrinsic motivation. (16 ref.)—*Journal abstract*.

570. Matsumoto, Gary M., Meredith, Gerald M., & Masuda, Minoru. (U. Washington, Medical School) Ethnic identification: Honolulu and Seattle Japanese-Americans. *Journal of Cross-Cultural Psychology*, 1970 (Spr), Vol. 1(1), 63-76.—1st-generation Japanese immigrants to Hawaii scored higher than either the 2nd- or 3rd-generation on the Ethnic Identity Questionnaire (EIQ). When the EIQ scores were compared with 3 generations of immigrants to Seattle from a comparable background, the latter were more ethnically identified. A number of possible reasons for this are discussed.—A. Krichew.

Social Structure & Social Role

571. Busch, Gladys M. (Indiana U.) A study of the relationship between the teachers' caste-consciousness and students' educational and occupational aspirations in high schools in India. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5063.

572. Chess, Stella. (New York U., Medical Center) Disadvantages of "the disadvantaged child." *American Journal of Orthopsychiatry*, 1969 (Jan), Vol. 39(1), 4-6.—Discusses the usage of the term disadvantaged. It is suggested that blanket use produces a stereotype which leads to the classification of children from diverse backgrounds into a limited category. It is cautioned that "to assess any individual child it is essential to know both the group characteristics and the variations within the group."—G. Steele.

573. Goldman, Irwin J., McDonald, Roslyn G., & Epstein, Joyce. (New York State Div. for Youth, New York) Characteristics of jobs held by economically disadvantaged youth. *American Journal of Orthopsychiatry*, 1970 (Jan), Vol. 40(1), 97-105.—Studied job histories of 112 16-18 yr. olds from low income neighborhoods. An interview schedule and the Hamburger Occupational Scale, with respect to characteristics of jobs held, extent of employment, nature of 1st jobs, and ethnic differences were utilized. The median number of full-time jobs held by Ss (from 1st job to time of interview) was 4. Findings indicate the possibility of vertical mobility among available jobs, but limited primarily to the 3 lowest occupational levels. Median pay of 35 45 hr/wk jobs was \$53. The jobs of Ss tend not to be in their own neighborhood. Source of job was predictive of pay ($p < .001$), duration ($p < .001$), and nonsignificantly, of evaluation ($p < .20$). A major difference in jobs held by the American Negro and jobs of Puerto Rican Ss was found in the source of employment. Almost twice as many jobs of Puerto Ricans were referred by friends, neighbors, and relatives than jobs of Negroes. Limitations of the findings are discussed.—A. M. Berg.

574. Hood, Ralph W. & Ginsburg, G. P. (South Dakota State U.) Cultural availability: A cross-

culturally stable determinant of performance on Remote Associates Test items. *Psychological Reports*, 1970 (Jun), Vol. 26(3), 755-758.—Demonstrated the stability of the previously obtained relationship between the difficulty and cultural availability of Remote Associates Test (RAT) items. Item difficulty was greatest for those items whose answers are not readily available in the local culture as associates to the stimulus words of the item. This effect was obtained in 2 geographically separate populations, one metropolitan and the other rural. It was shown that the cultural availability levels of items varied across populations. The implications of RAT item variation in cultural availability both within and between cultures are discussed.—*Journal abstract*.

575. Kassirer, H., Rosenberg, E., & Trudeau, P. (Hofstra U.) Cross validation of the Environmental Participation Index in a group of economically deprived high school students. *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 373-376.—The Environmental Participation Index (EPI), WAIS, or WISC was administered to 96 underachieving, disadvantaged high school students. Various relationships were presented but none of the relationships found had practical utility. Results indicate that the EPI was reliable but validity was interrelated with intelligence and academic achievement. The need for normative revision of the EPI is suggested.—E. J. Kronenberger.

576. Nelsen, Hart M. & Storey, Stuart E. (Western Kentucky U.) Personality adjustment of rural and urban youth: The formation of a rural disadvantaged subculture. *Rural Sociology*, 1969 (Mar), Vol. 34(1), 43-55.—Administered the Mooney Check List to 49 rural, 32 town, and 164 city boys to investigate personality adjustment. Data support the hypothesis that rural youths would be most poorly adjusted, followed by town and city youths. Findings indicate the need to reevaluate the importance of the rural-urban dichotomy. A "rural factor" that is linked with poverty and will affect personality adjustment may be emerging. (34 ref.)—*Journal abstract*.

577. Weis, Susan J. (Pennsylvania State U.) Self esteem and self implementation in role saliency of women. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5071-5072.

578. Zurich, M. (Southern Illinois U.) Attitudes of lower- and middle-class families concerning personal adjustment. *Psychological Reports*, 1970 (Jun), Vol. 26(3), 750.—Obtained information concerning attitudes of adults toward personal adjustment, and tested the hypothesis that attitudes toward such factors as economic security, family, friends, feeling of usefulness, happiness, health, religion, and work are independent of social class. Significant differences were observed in attitudes toward family, health, friends, and happiness ($p = .05$).—*Author abstract*.

Religion

579. Bohrnstedt, George W., Borgatta, Edgar F., & Evans, Robert R. (U. Wisconsin, Social Behavior Research Center) Religious affiliation, religiosity, and MMPI scores. *Journal for the Scientific Study of Religion*, 1968 (Fall), Vol. 7(2), 255-258.—Compares the MMPI scores of 1851 male and 1815 female Catholics, Protestants, and Jews with each other and with those of no religious identification and relates them to religious identification and a measure of religiosity. Sex and

affiliation effects were found. It is concluded that the MMPI may not be a suitable measure of personality for relating religiosity and religious identification to personality, since several of the MMPI scales contain religious content.—G. Steele.

580. Capps, Donald. (U. Chicago, Divinity School) **Orestes Brownson: The psychology of religious affiliation.** *Journal for the Scientific Study of Religion*, 1968 (Fall), Vol. 7(2), 197-209.—Examines the career of Orestes Brownson, who roamed from church to church during his adult life. It is suggested that the need to affiliate with religious groups can be best understood by noting how related personal and social factors interact to influence affiliation behavior. Brownson relied on religious affiliations to reverse the disrupting effects of personal lack of parental guidance in a social climate of confusing religious controversy. His Catholic conversion was the direct result of the tendency of his Protestant affiliations to intensify rather than mitigate these early frustrations.—*Journal abstract*.

581. Dean, Dwight G. (Iowa State U.) **Anomie, powerlessness, and religious participation.** *Journal for the Scientific Study of Religion*, 1968 (Fall), Vol. 7(2), 252-254.—Administered questionnaires to 145 undergraduates to obtain measures of anomie, powerlessness, and religiosity in an investigation of the need-fulfilling function of religion. Results confirmed W. Bell's (see PA, Vol. 33:3491) findings of no relationship and indicated "a curvilinear relationship between a measure of powerlessness and religious participation."—G. Steele.

582. Homans, Peter. **Theology after Freud: An interpretive inquiry.** Indianapolis, Ind.: Bobbs-Merrill, 1970. xvii, 254 p. \$4.25.

583. Lamm, Norman. (Jewish Center, New York, N.Y.) **The role of the synagogue in sex education.** *Child & Family*, 1968 (Fall), Vol. 7(4), 348-360.—Examines the Jewish philosophical approach to sex and sex education. 4 questions are discussed from a Jewish viewpoint: (a) should sex education be undertaken, (b) what should be taught conceptually, (c) who should teach sex education, and (d) how "shall it be transmitted." Hedonism, primary aim, locale, trust, shame, giving, objectification, and values are discussed.—G. Steele.

Cross Cultural Comparison

584. Brehmer, Brendt, et al. (U. Umeå, Sweden) **A cross-national comparison of cognitive conflict.** *Journal of Cross-Cultural Psychology*, 1970 (Spr), Vol. 1(1), 5-20.—The results of 5 "lens model" interpersonal conflict experiments were carried out in 5 countries: Czechoslovakia, Greece, Japan, Sweden, and the United States. Conflict resolution was found to be very slow. It is concluded that the phenomena studied are independent of cultural factors, and reflect limitations in the human information processing system. (16 ref.)—A. Krichew.

585. Ekman, Paul; Sorenson, E. Richard, & Friesen, Wallace V. (Langley Porter Neuropsychiatric Inst., San Francisco, Calif.) **Pan-cultural elements in facial displays of emotion.** *Science*, 1969 (Apr), Vol. 164(3875), 86-88.—Presented 30 photographs, each showing a facial display of a single emotion to a sample of 215 Os from the United States, Brazil, Japan, New Guinea, and Borneo. Os were told to select the word from a list of 6 affects which best described each picture.

Os in both literate and preliterate cultures chose the predicted emotion for photographs of the face, although agreement was higher in the literate samples. Findings suggest that the pan-cultural element in facial displays of emotion is the association between facial muscular movements and discrete primary emotions, although cultures may still differ in what evokes an emotion, in rules for controlling the display of emotion, and in behavioral consequences.—*Journal abstract*.

586. Lynn, R., Zahraee, R., & Rim, Y. (Economic & Social Research Inst., Dublin, Ireland) **Psychological factors in economic growth.** *Manpower & Applied Psychology*, 1968 (Sum), Vol. 2(1), 76-83.—Comparisons were made between a number of attitudes of university students and schoolboys in Britain and Israel. The 2 countries were chosen as representatives of the extremes of economic growth, Britain being exceptionally low and Israel exceptionally high. It was found that Israeli youth were more ambitious for a successful career and attached more value to the amount of esteem and independence conferred by their occupations.—P. L. Crawford.

587. Meredith, Howard V. (U. Iowa) **Body size of contemporary groups of one-year-old infants studied in different parts of the world.** *Child Development*, 1970 (Sep), Vol. 41(3), 551-600.—Collected source materials from 170 investigations reporting findings for body size at end of the 1st postnatal yr. Measurement of the infants took place largely between 1950 and 1960 in Africa, Asia, Australia, Europe, North and South America, Oceania, and the Malay Archipelago. Inter-comparisons are made for body weight and length, width, depth, and girth of head, chest and abdomen circumferences, vertex-rump and rump-soles lengths, and width of hips. At 1 yr., coeval groups of infants living in various geographic locations differed as much as 9 lb. in average body weight, 5.5 in. in average body length, and 2.5 in. in average chest circumference. (8 p. ref.)—*Journal abstract*.

588. Murphy, Lois & Murphy, Gardner. **Perspectives in cross-cultural research.** *Journal of Cross-Cultural Psychology*, 1970 (Spr), Vol. 1(1), 1-4.—Explores some of the issues of international interdisciplinary research on cross-cultural problems. Some of the goals of such a study are defined.—A. Krichew.

589. Newton, Niles. (Northwestern U., Medical School) **The effect of psychological environment on childbirth: Combined cross-cultural and experimental approach.** *Journal of Cross-Cultural Psychology*, 1970 (Spr), Vol. 1(1), 85-90.—A comparison of the birth patterning of the Cuna and the Siriono Indians of South America led to the conclusion that the acceptance of birth as a normal physiologic phenomena uncomplicated by shame led to speedier, easier births. This conclusion was experimentally tested in mice. Disturbances applied during their labor resulted in immediate reduction of labor speed. Fewer births resulted from switching mice from a familiar to an unfamiliar environment periodically. These results were interpreted as following from the original hypothesis.—*Journal abstract*.

590. Sloggett, Barbara B., Gallimore, Ronald, & Kubany, Edward S. (U. Hawaii) **A comparative analysis of fantasy need achievement among high and low achieving male Hawaiian-Americans.** *Journal of Cross-Cultural Psychology*, 1970 (Spr), Vol. 1(1), 53-61.—Fantasy need achievement scores were obtained from male Filipino-American, Japanese-American, and indigenous Hawaiian high school students who were

divided into high and low achieving groups. The only significant differences were between the Japanese and the 2 Hawaiian groups who had the lowest need Achievement scores. The results were interpreted as challenging the usefulness of the notion that Hawaiian children do well or poorly in school depending on their need Achievement level.—*Journal abstract.*

Family

591. Bultena, Gordon L. (U. Wisconsin) **Rural-urban differences in the familial interaction of the aged.** *Rural Sociology*, 1969 (Mar), Vol. 34(1), 5-15.—Analyzed the frequency with which 507 elderly persons in rural and urban communities interact on a face-to-face basis with their adult children and siblings. It was found, contrary to theoretical expectations, that where there are differences in interaction levels, they favor the urban aged. Findings suggest that a deterioration in family ties from traditional patterns may be becoming more advanced in rural areas than in the city, where kinship groups are being reconstituted and assuming increased importance as a result of a build-up of several generations of family members. (20 ref.)—*Journal abstract.*

592. Libby, Roger W. (Washington State U.) **Parental attitudes toward high school sex education programs.** *Family Coordinator*, 1970 (Jul), Vol. 19(3), 234-247.—125 parent couples were interviewed (spouses were interviewed both separately and concurrently). A semistructured interview was used, followed by each interviewer completing a Sex Education Liberalism Scale. Results indicate that: (a) the higher the social class, the greater the liberality toward sex education; (b) parents with prepubescent offspring score higher in liberalism than parents with postpubescent offspring; and (c) Catholics have lower liberalism scores than all others, while Jewish, Unitarian, and those with "no religion" score highest. Nearly all parents approved high school sex education integrated throughout the curriculum, and a majority favored discussion of a variety of sexual attitudes and standards.—*M. W. Linn.*

Social Change & Social Programs

593. Doob, Leonard W. (Ed.) (Yale U.) **Resolving conflict in Africa: The Fermeda workshop.** New Haven, Conn.: Yale U. Press, 1970. xvii, 209 p. \$7.50.

594. Evans, Dorothy A. & Alexander, Sheldon. (U. Rochester, Medical Center) **Some psychological correlates of civil rights activity.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 899-906.—Compared Northern Negroes and whites at varying levels of participation in undergraduate civil rights groups with selected groups of Northern, Negro nonmembers of civil rights groups on a number of personality and demographic variables. Negro actives showed more repression and ego strength than nonactives. White actives showed less social approval motivation and less repression than Negro actives. In contrast to studies of Southern Negroes, Negro actives came from a lower socioeconomic background than Negro nonactives and internal vs. external control of reinforcement and number of non-civil-rights group memberships were unrelated to civil rights activity level. Factors other than activity level are important in predicting personality and demographic differences among civil rights activists and nonactivists. The

importance of additional empirical research is also discussed.—*Journal abstract.*

595. Golin, Sanford; Davis, Eugene; Zuckerman, Edward, & Harrison, Nelson. (U. Pittsburgh) **Psychology in the community: Project Self-Esteem.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 735-740.—Describes the development of Project Self-Esteem, a psychoeducational program in progress in 3 urban elementary schools in black communities. Some ways in which psychologists have participated in and contributed to programs in ghettoized communities are illustrated.—*Journal abstract.*

596. Mitscherlich, Alexander. **Panel on "Protest and revolution."** *International Journal of Psycho-Analysis*, 1970 (Apr), Vol. 51(2), 211-218.—In a paper published in 1969 Mitscherlich noted that student protests are seemingly independent of political ideologies and connected to affluence and privilege groups. Presently the protests appear to be in a revolutionary stage focusing on society ills with a goal to change society. Panelists connect protests with mass communication, technological improvements, the war, the triumph of child-rearing practices, exaggerated adolescent strivings, acting-out individuals, insecure parents, etc. The major problem as to whether protests represent health or pathology is debated but unanswered.—*J. Chyatte.*

597. Wallace, John M. (Michigan State U.) **Factors affecting perceived ability to introduce change among Agency for International Development trainees.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5071.

SEXUAL BEHAVIOR

598. Herman, John R. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Impotency throughout the ages.** *Journal of the American Society of Psychosomatic Dentistry & Medicine*, 1969 (Jul), Vol. 16(3), 93-99.—Presents recorded data on impotency for the past 5000 yr. Indian sources predominate.—*M. V. Kline.*

599. Sutker, Patricia B., Sutker, Louis W., & Kilpatrick, Dean G. (Tulane U., Medical School) **Religious preference, practice, and personal sexual attitudes and behavior.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 835-841.—Investigated the influence of religious affiliation and religiosity upon reported sexual attitudes and behavior in the South. A Sexual Attitude Survey (SAS) was administered to 509 undergraduates, divided into Catholics, Protestants, Jews, and nonbelievers and further classified by frequency of monthly church attendance. Results indicate that men were more sexually liberal than women regardless of religious preference or religiosity, sexual liberality decreased with increased frequency of church attendance, and nonbelievers reported more liberal sexual attitudes and behavior than Catholics, Protestants, and Jews.—*Journal abstract.*

Birth Control & Abortion

600. ———. **Recent setbacks in medicine: A second sampler on the pill.** *Child & Family*, 1968 (Spr), Vol. 7(2), 170-187.—Cites studies of psychological side effects in the use of oral contraceptives.

601. Carroll, Charles. (U. California, Medical Center, San Francisco) **"Liberalized" abortion: A critique.** *Child & Family*, 1968 (Spr), Vol. 7(2), 157-169.—Dis-

cusses the pros and cons of liberalized abortion and concludes that the main issue involved is not concern for either the mother or the child but the power of life and death over ourselves and over others. (20 ref.)—J. L. Ahlberg.

602. Jakabovits, Immanuel. **Jewish views on abortion.** *Child & Family*, 1968 (Spr), Vol. 7(2), 142-156.—Discusses the Jewish view of abortion based on biblical writings, Talmudic teaching, and contemporary scholars. It is concluded that only concern for the mother's safety is a valid argument in favor of abortion. (57 ref.)—J. L. Ahlberg.

603. Thurstone, Phyllis B. (222 W. 39th Ave., San Mateo, Calif.) **Therapeutic abortion: The experience of San Mateo County General Hospital and the state of California.** *JAMA: Journal of the American Medical Association*, 1969 (Jul), Vol. 209(2), 229-231.—The 1st annual report after enactment of the new liberalized abortion law in California shows that a total of 91% of the 4291 applicants for therapeutic abortion were approved; a total of 3775 therapeutic abortions were performed. The overall incidence of therapeutic abortions to live births was 11.2:1000. Psychiatric indications accounted for 86% of the abortions performed. An analysis of the experience at San Mateo County General Hospital is presented to review indications, methods, and complications.—*Journal abstract*.

ATTITUDES & OPINIONS

604. Becker, Marcia R. (New School for Social Research) **The visual cues used in ethnic identification.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5219-5220.

605. Bentz, W. Kenneth; Hollister, William G., & Kherlopian, Margaret. **Attitudes of social distance and social responsibility for mental illness: A comparison of teachers and the general public.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 198-203.—Compared the attitudes of rural teachers and rural lay people with regard to social distance from formerly mentally ill persons and to social responsibility for mental illness in the community. Results indicate that teachers are less willing than the public to interact with ex-mental patients. Teachers show less social responsibility for mental illness than the public.—H. Kaczowski.

606. Prestage, R. O. (Child Guidance Training Centre, London, England) **Communication between the living and the dying.** *British Journal of Psychiatric Social Work*, 1968 (Spr), Vol. 9(3), 139-143.—Reviews factors influencing attitudes toward death and diseases and the implications for both the individual and society of "modes of communication that predominate between the living and the dying."

607. Priest, Robert F. & Abrahams, Joel. (U. Missouri, St. Louis) **Candidate preference and hostile humor in the 1968 elections.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 779-783.—College students rated hostile jokes about Wallace, Nixon, Humphrey, and McCarthy's disaffected liberal on the day before the 1968 election. The difference in their response to jokes about Humphrey and Nixon correlated .42 with candidate preference for 120 psychology students, and .58 for 35 political science student volunteers. The difference in response to jokes about disaffected liberals vs. jokes about other groups correlated significantly with attitude toward the Democratic party but not with candidate

preference. Results support reference group theory, replicate 2 other studies of election humor, and suggest that enjoyment of hostile humor depends upon who is being aggressed against.—*Journal abstract*.

608. Sato, Kimiko. (Kyoto Gakuen U., Japan) [On the problem of change of meaning: Semantic satiation.] *Japanese Journal of Psychology*, 1969 (Oct), Vol. 40(4), 182-191.—Investigated methodological problems in the measurement of change of meaning. Exp. I examined the 'midpoint of a semantic differential (SD) scale, classified types of change of meaning, and measured change of meaning on each scale. Results indicate that: (a) interaction among repeated words, the scale of meaning, and types of change of meaning are significant; (b) word repetition may lead to transformative change in addition to decreases and increases of meaning; and (c) the effects of word repetition on meaning are determined by the interaction of words, scales, and types of change. Exp. II examined the effect of meaningless word repetition. Results are consistent with Johnson's findings in that the increases of generation change were obtained. Exp. III examined the bipolar continuum of an SD scale. Data indicate that change of meaning can be rated more accurately on a bipolar than a unipolar scale. The bipolar continuum is discussed on the basis of R. F. Green's study. Exp. IV confirmed the property of "semantic satiation" by an application of the verbal association method. Results correspond to those obtained by the SD method. An application of the transformational function by D. E. Berlyne of the mediation process is suggested. (32 ref.)—*English abstract*.

609. Thomas, R. E., Smith, Joan M., & Spence, P. A. (U. Lancaster, England) **Wheeling and dealing: A new approach to the collection of attitude and motivational data by the use of semantic differential scales.** *Journal of the Market Research Society*, 1968 (Apr), Vol. 10(2), 78-86.—Suggests a method of data collection in which semantic differential scales can be presented as the spokes of a wheel on a printed card. Presentation of the "Lancaster Wheel" in an initial survey of the structure of the "bed-covering" market in the United Kingdom indicates that the 640 respondents were enthusiastically cooperative, completing 72 scales in a mean of 5 min. This contrasts with about 30 min. required completion time for the same number of scales presented in tabular form. Potential problems involve: (a) return of incomplete wheels, (b) interviewers forgetting to add code numbers, (c) difficulty in preparing data for punching, and (d) possibility of patterned responses. Further surveys have suggested ways of overcoming these problems. Appropriate methods of data analysis are discussed, and a variety of situations in which the technique can be advantageously applied are suggested.—R. Wiltz.

610. Upshaw, Harry S., Ostrom, Thomas M., & Ward, Charles D. (U. Illinois, Chicago Circle) **Content versus self-rating in attitude research.** *Journal of Experimental Social Psychology*, 1970 (Jul), Vol. 6(3), 272-279.—Distinguishes between 2 modes of attitudinal expression: the content of an attitudinal position, and the person's self-rating of the pro-ness or con-ness of his attitudinal position. When made operational, these 2 facets of attitude require the performance of different scaling tasks termed Tasks A and B, respectively, in the C. H. Coombs system. 39 undergraduates completed a Thurstone scale under 1 of 3 attitude perspective

conditions. The perspective conditions were induced by the attribution of differing ranges of opinion (attitude content) to a relevant peer group. As predicted, the manipulation of perspective influenced Ss' self-ratings but not their content scores.—*Journal abstract.*

Formation & Change

611. Arrowood, A. John; Wood, Linda, & Ross, Lee. (U. Toronto, Ontario, Canada) **Dissonance, self-perception, and the perception of others: A study in cognitive dissonance.** *Journal of Experimental Social Psychology*, 1970 (Jul), Vol. 6(3), 304-315.—68 undergraduates were simultaneously involved participants in a dissonance experiment and Os of other participants. As involved Ss, those who expected to expend a great deal of effort preparing for a test which they might not have to take showed high subjective probability that they personally would take the test. As Os answering the same question for the person seated 3 seats away, they showed no such responsiveness to the manipulation of anticipated effort. The apparent demonstration of dissonance reduction by Ss who engaged in no overt behavior from which to infer their beliefs challenges D. J. Bem's self-perception interpretation of what others have regarded as dissonance reduction. The failure of Os to duplicate the subjective probability responses of involved Ss under identical stimulus conditions poses further problems for Bem's self-perception model. Data suggest the subjective response to an aversive motivational state rather than simple self-perception.—*Journal abstract.*

612. Hall, Edwin P. (U. Alabama) **An experimental study of the modification of attitudes toward the mentally retarded.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4828.

613. Horowitz, Irwin A. & Gumenik, William E. (U. Toledo) **Effects of volunteer subject, choice, and fear arousal on attitude change.** *Journal of Experimental Social Psychology*, 1970 (Jul), Vol. 6(3), 293-303.—120 undergraduates who had volunteered (volunteers) and Ss who had refused to volunteer (nonvolunteers) for a previous experiment which was not run were recruited. Upon reporting, both volunteers and nonvolunteers were either given or not given choice as to participation in, and selection of experiments. The volunteering and choice variables were combined factorially with high or low fear arousal. Volunteers and Ss allowed choice exhibited greater acceptance of the recommendations of the appeal than did nonvolunteers and Ss allowed no choice, respectively. Nonvolunteers allowed choice and volunteers exhibited greater acceptance of the recommendations of the high fear appeal than of the low fear appeal. The reverse occurred for nonvolunteers allowed no choice. Results are interpreted in terms of reactance theory.—*Journal abstract.*

614. Jones, James M. (U. Northern Iowa) **Dimensions of meaning and attitude change.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 955-962.—In a pretest-posttest control group design with 2 experimental samples and a treated control sample, 132 undergraduates responded twice to a Sherif-Hovland instrument. The intervening treatments written by E appeared to be Xeroxed copies of newspaper articles: 1 represented primarily the evaluative (E) dimension of meaning and the other was a fusion of potency (P) and activity (A), i.e., dynamism (D). A control (C) article was irrelevant to the experimental issue, i.e., censorship of movies.

Posttest-pretest change scores were compared for the 3 samples by 15 t tests for independent samples. E and D were not significantly different because both changed on the 5 Sherif-Hovland measures in the same directions. Compared with C, however, E was quite effective; 4 of the 5 measures changed significantly; comparisons of D and C indicated that 2 of the 5 measures changed significantly. For this issue E was more effective than D. More research is needed to clarify the effects of dimensions of meaning of communications on attitude change.—*Journal abstract.*

615. Keith-Spiegel, Patricia & Spiegel, D. E. (San Fernando Valley State Coll.) **Effects of mental hospital experiences on attitudes of teen-age students toward mental illness.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 387-388.—30 college students participated in a volunteer project at a psychiatric institution. The Custodial Mental Illness Ideology Scale was used to measure the degree of custodial as opposed to humanistic attitudes toward mental illness. Before and after individual item change scores were computed. Student attitudes did change in the direction of a more realistic view of mental illness and the students became relatively at ease and comfortable in working with patients.—*E. J. Kronenberger.*

616. Masten, Ellsworth E. (U. Iowa) **Modes of dissonance reduction in relation to cognitive dissonance concerning vocational choice.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5241.

617. Ostrom, Thomas M. (Ohio State U.) **Perspective as a determinant of attitude change.** *Journal of Experimental Social Psychology*, 1970 (Jul), Vol. 6(3), 280-292.—Hypothesized that the relationship between attitudinal beliefs (content) and the way those beliefs (rating) are labeled on an evaluative dimension is mediated by perspective, or the range of alternatives taken into consideration when the evaluative judgment is being made. Exp. I with 118 undergraduates showed that the evaluative label which the S assigned to his attitude content was strongly affected by a manipulation of perspective. When matched for length of prison sentence advocated for a convicted criminal, Ss in 1 perspective condition viewed their recommended punishment as slightly lenient whereas those Ss in the other perspective condition rated themselves as extremely stern. Exp. II with 100 undergraduates showed that people will change their attitudinal content to remain consistent with their initial self-evaluation under conditions of a manipulated perspective. Ss were induced, holding initial self-rating constant, to advocate as much as twice as long a prison sentence in 1 perspective condition as in the other.—*Journal abstract.*

619. Wagner, Richard V. & Sherwood, John J. (Eds.) (Bucknell U.) **The study of attitude change.** Belmont, Calif.: Brooks/Cole, 1969. vii, 213 p.—Presents articles by various authors concerning major theoretical approaches to the study of attitude change and the research engendered by these approaches. This book is the 1st in a series of in-depth studies for graduate and undergraduate students of particular social psychological problems.

620. Walster, G. William & Walster, Elaine. (U. Wisconsin) **Choice between negative alternatives:**

Dissonance reduction or regret? *Psychological Reports*, 1970 (Jun), Vol. 26(3), 995-1005.—Investigated whether or not individuals commonly experience regret after making decisions. Previous results suggested Ss probably experienced more regret as time passed. There was no evidence that they ever succeeded in reducing dissonance. 1 of 3 current interpretations is that the more negative the choice alternatives, the more postdecisional regret a decision maker should experience. An experimental design to test alternative interpretations is proposed. (17 ref.)

GROUP & INTERPERSONAL PROCESSES

621. **Armor, Thomas H.** (U. California, Los Angeles) **Peak-experiences and sensitivity training groups.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5218.

622. **Bell, Paul R. & Jamieson, Bruce D.** (IBM World Trade Corp., Wellington, New Zealand) **Publicity of initial decisions and the risky shift phenomenon.** *Journal of Experimental Social Psychology*, 1970 (Jul), Vol. 6(3), 329-345.—96 male and 96 female undergraduates in same-sex groups of 4 were administered the Wallach and Kogan Choice Dilemmas instrument, in a 4 × 2 factorial design which investigated public and private initial decisions for familiarization, listening, information, and discussion conditions. As predicted, discussion public and listening private condition individual decisions shifted to risk. A 2nd hypothesis, that risky shifts would be larger within each condition when initial decisions remained private than when they had been made public was rejected. More initial decisions were found to have changed when these remained private than when they were made public. An extreme groups analysis revealed that larger risky shifts occurred for Ss whose confidence was low than for Ss whose confidence was high. The significance of the publicity variable and the necessity of its control is discussed. (20 ref.)—*Journal abstract*.

623. **Bowditch, James L.** (Purdue U.) **Biographical similarity and interpersonal choice.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5220-5221.

624. **Brown, Bert R.** (Cornell U.) **Face-saving following experimentally induced embarrassment.** *Journal of Experimental Social Psychology*, 1970 (Jul), Vol. 6(3), 255-271.—In Exp. I, 48 male undergraduates performed either an embarrassing or nonembarrassing task and then chose between: (a) maximizing their monetary payoffs by describing their reactions publicly, or (b) accepting smaller payoffs to avoid public exposure. 1/2 of the Ss believed that their potential payoffs were announced to an audience, and 1/2 believed they would remain unannounced. Sacrifice was pronounced when Ss performed the embarrassing task and also believed the audience was ignorant of their costs. Exp. II explored the effects of audience role and identity on face-saving with 44 male undergraduates. 1/2 of the Ss believed the audience had an evaluative role, and 1/2 believed it would be nonevaluative while they described their reactions to the embarrassing task. Also, 1/2 had a male audience, 1/2 had a female audience. Face-saving was greatest in the evaluative condition. Results of both

experiments are discussed in terms of the costliness of attempts to avoid looking foolish in public. (24 ref.)—*Journal abstract*.

626. **Furr, Richard M.** (U. Tennessee) **The use of observational learning in the development of the human relations skills of leaders.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5373.

627. **Knott, Paul D.** (U. Denver) **A further methodological study of the measurement of interpersonal aggression.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 807-809.—Placed the 9 highest (HH) and 9 lowest (LH) scorers on the Buss-Durkee Hostility Inventory out of 115 males into an identical situation in which they received mild shocks on 6 of 60 trials. All Ss were angered by this procedure according to their scores on a self-report mood inventory. The HH and LH Ss significantly differed from each other on measures of number and intensity of shocks used and in terms of the 1st trial on which they retaliated. No evidence was found for the notion that number and intensity of shocks measure different processes of interpersonal aggression.—*Journal abstract*.

628. **Kolher, Adam T.** (U. California, Los Angeles) **Some possible effects of leader-member similarity-dissimilarity in the counseling technique of group psychoevaluation.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5240.

629. **Lamm, Helmut & Kogan, Nathan.** (U. Mannheim, W. Germany) **Risk taking in the context of intergroup negotiation.** *Journal of Experimental Social Psychology*, 1970 (Jul), Vol. 6(3), 351-363.—Pairs of 3-person male groups, working separately, came to unanimous decisions on preferred risk levels of 1/2 of the items in the choice dilemmas procedure. All 72 undergraduate Ss had previously filled out the full 12-item questionnaire. Each group elected a representative to defend the group's interests (high commitment), and selected an alternate (medium commitment). The remaining Ss constituted the nonrepresentative (low commitment). Each S in 1 of the groups was then matched with his status equivalent in the other group. These dyads negotiated agreements for the 6 items where there was a previous reference group position (fixed) and for the 6 items where there were only prior individual positions (open). For both fixed and open items, nonrepresentatives and alternates manifested risky shifts in their joint decisions, whereas representatives reached decisions through averaging. Results imply that high levels of commitment in the context of intergroup negotiation can disrupt the valuations processes underlying the risky shift in the standard intragroup situation. (21 ref.)—*Journal abstract*.

connotative meaning of selected social interaction concepts. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5069.

633. Riach, Margaret J. (Washington School of Psychiatry, D.C.) **The work of Wilfred Bion on groups.** *Psychiatry, Washington, D.C.*, 1970 (Feb), Vol. 33(1), 56-66.—Explicates some of the basic theories of Wilfred Bion that are necessary to his conceptual analyses of groups. Distinguishes between the work group (which is the ideal, task-oriented, purposeful group) and the basic assumption group (which fulfills neurotic needs of its members rather than its assigned function). There are 3 types of basic assumption groups: (a) one is characterized by dependency on a leader, (b) another is noted for its gathering against the outside work world and is called a "fight-flight" group, and (c) the last is a pairing group based on the concept of redemption by the created Messiah. These are the mythic bases for groups and are found to some degree in all groups since the ideal work group is a symbol toward which groups strive.—*E. Upchurch*.

634. Shaw, Jerry I. (U. California, Los Angeles) **Situational factors leading to the acquisition of a "psychological advantage" in competitive negotiations.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5069-5070.

635. Teger, Allan I., Pruitt, Dean G., St. Jean, Richard, & Haaland, Gordon A. (U. Pennsylvania) **A reexamination of the familiarization hypothesis in group risk taking.** *Journal of Experimental Social Psychology*, 1970 (Jul), Vol. 6(3), 346-350.—226 Ss at 3 universities participated in 5 separate studies which measured the effect on individual risk taking of increased familiarity with the problem situation. Results failed to replicate the finding that individuals will take increased risk after they are given an opportunity to become familiar with the problem. These failures to replicate cast doubt on the hypothesis that the increase in risk after a group discussion is due to increased familiarity with the problems rather than to the effect of group interaction.—*Journal abstract*.

636. Tolor, Alexander. (Fairfield U., Inst. for Human Development) **The "natural course" view of conflict resolution.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 734.—After observation of early intransigence of groups involved in a university student disorder and their ultimate agreement, it is hypothesized that "no matter how conducive to conflict resolution circumstances are after a certain critical phase in the dispute has been attained, further progress must await the passage of a 'respectable' amount of time."—*M. Daniels*.

638. Weight, David G. (U. Washington) **The internal-external locus of control dimension as a variable in the verbal behavior of subjects and experimenters.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5246-5247.

639. Wiener, Daniel J. (St. Dunstan's U., Charlotte-town, Prince Edward Island, Canada) **Failure of personality variables to mediate interpersonal attraction.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 784-786.—In previous research conducted by D. Byrne a consistent finding has been that attraction toward a stranger is a direct linear function of the proportion of

attitudes S and the stranger share. However, considerable individual differences in attraction responses toward strangers evincing equal-attitude similarity suggest the existence of mediating personality variables. Attraction scores derived from the standard Byrne paradigm were correlated with personality measures for overlapping subgroups of 543 undergraduates. These measures were: Marlowe-Crowne Social Desirability, Test Anxiety Questionnaire, Edwards Social Desirability, D-30 Depression, and Leary Interpersonal Checklist (ICL) scales. Only the Dominance-Submission measure of the Leary ICL correlated significantly with attraction and only for high similarity Ss ($r = .31$, $N = 43$, $p < .05$). It is suggested that attention be focused upon within-S attraction variance to explore the phenomenon further.—*Journal abstract*.

Influence & Communication

COMMUNICATION

653. Cameron, Paul. (U. Evansville) **The words college students use and what they talk about.** *Journal of Communication Disorders*, 1970 (Jun), Vol. 3(1), 36-46.—Presents results of 2 studies in which eavesdroppers recorded words and topics of unguarded conversations of undergraduates. In Study I, speech samples from 2000 students produced 1668 different words from a total word sample of 48,912. In Study II, sampled speech of 900 students produced 3468 sentences and 27 categories of conversation topics. Data are presented in tables of: (a) the 100 most frequently used words; (b) categories and frequencies of profane words; (c) frequency of sex-organ related words, numbers, parts of speech, conversation topics, and subjects of sentences; and (d) general categories of conversation. Results are compared with those of previous investigations.—M. Maney.

654. Frumkina, R. M. (Inst. of Linguistics, Moscow, USSR) **Subektivnye otsenki chastot elementov teksta i veroyatnostnoe prognozirovaniye rechevogo povedeniya.** [Subjective judgments of the frequency of text elements and the probabilistic prediction of verbal behavior.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 76-85.—Discusses Soviet and foreign research on verbal behavior and the subjective and objective probabilities of words. It is suggested that verbal behavior can be predicted better on the basis of subjective than objective

word probabilities. An experiment in which 30 Ss rated 100 words of varying objective frequencies on a 6-point scale is described. Subjective and objective frequencies were, in general, in agreement. Deviations from agreement are discussed in terms of the relationship between the frequency of signs and the frequency of their significates. (English summary) (22 ref.)—L. Zusne.

655. Hipskind, Nicholas M. & Nerbonne, G. Patrick. (U. Massachusetts) **The most common words used in conversations: Western Massachusetts.** *Journal of Communication Disorders*, 1970 (Jun), Vol. 3(1), 47-58.—A total of 25000 words was collected, 2268 of which were different. Samples were collected by means of portable tape recorders. The inventory revealed results similar to those of K. W. Berger (see PA, Vol. 42:12053) that were obtained in an inventory made in northeastern Ohio. The words collected and their frequencies of occurrence are presented in the appendix, in alphabetical order. Results indicate a need for additional sampling within the Eastern dialect region. (15 ref.)—*Journal abstract*.

656. Kausler, Donald H. & Kollasch, Sylvia F. (St. Louis U.) **Word associations to homographs.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 444-449.—Scored word associations to 40 homographic stimuli in terms of the semantic features serving as S's apparent functional stimulus, and determined hierarchies related to the separate sets of features of homographs. 100 male and 100 female undergraduates served as Ss in each form of the word association test and 50 males and 50 females served as Ss in the sentence construction test. The dominant meaning in the associative hierarchy was the more frequently occurring meaning in semantic counts, a finding in agreement with a spew-like principle of perceiving homographic stimuli.—*Journal abstract*.

657. Martin, J. E. (Pennsylvania State U.) **Adjective order and juncture.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 379-383.—Provides evidence from an experiment with 54 undergraduates that juncture phenomena are an important and robust aspect of the phenomenon of preferred adjective order. The cyclical scanning procedure, hypothesized to explain juncture phenomena, is an example of the class of psychological cycles.—*Journal abstract*.

658. Stanners, Robert F. (Oklahoma State U.) **Language frequency correlates of rated pronounciability.** *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 373-378.—Related language frequency to pronounciability (Pr) ratings taken from the norms constructed by B. F. Underwood and R. W. Schulz (see PA, Vol. 35:3113). A study by R. L. Venezky of the frequency of spelling-to-sound correspondences in a large sample of English words provided the frequency data. The materials were trigrams which could be analyzed into 3 phonemes. Multiple regression analysis was used to assess the separate contribution to the prediction of Pr of the initial, the medial, and the final phonemes of the trigrams. The overall relationship of the Venezky frequencies to Pr was much higher than the relationship of written frequency to Pr. Each of the phoneme frequencies made a significant contribution to the prediction of Pr, but the contribution of the initial and final phonemes was much larger than that for the medial phoneme.—*Journal abstract*.

659. Wang, Marilyn D. (U. Pittsburgh, Eye & Ear Hosp. & Medical School, Bioacoustics Lab.) **The role of**

syntactic complexity as a determiner of comprehensibility. *Journal of Verbal Learning & Verbal Behavior*, 1970 (Aug), Vol. 9(4), 398-404.—Investigated the hypothesis that comprehensibility is a function of syntactic complexity. 75 sentences, ranging from 5-29 words, each with a different syntactic structure, were tape-recorded and were then judged for comprehensibility by 40 paid volunteer undergraduates. The predictive validities of 8 measures of surface structure complexity were evaluated by means of a stepwise multiple regression analysis of the comprehensibility ratings. Only 3 measures contributed significantly to the prediction of comprehensibility: mean linguistic depth, the number of self-embedded structures in the sentence, and the number of conjoining transformations in the derivational history of the sentence. (19 ref.)—*Journal abstract*.

Language

660. Narskii, I. S. **Problem znaka i znacheniya.** [The problem of sign and meaning.] Moscow, USSR: Moscow U., 1969. 172 p.—Presents a collection of 9 papers on sign and meaning from thegnoseological, logical, and linguistic viewpoints developed and reworked from materials originally presented at a 1963 symposium on the "problem of meaning," held in Moscow.—*I. D. London*.

661. Petrov, Yu. A. (Inst. of Psychology, Moscow, USSR) **Opyt formalizatsii vosprositel'nykh predlozhenii (voprosov).** [An attempt at formalization of interrogatory sentences (questions).] *Voprosy Algoritmizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 39-52.—Constructs a formalized language of interrogatory sentences in order to formulate rules for the recognition of meaningful questions.—*I. D. London*.

662. Shenshev, L. V. (Inst. of Psychology, Moscow, USSR) **Sposob mashinnoi segmentatsii rukopisnykh slov.** [A method of machine segmentation of words in cursive letters.] *Voprosy Algoritmizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 226-231.—Proposes a "compromise" method whereby the machine for recognition of cursive writing segments the words not on the level of letters, but on the level of morphemes.—*I. D. London*.

663. Shenshev, L. V. (Inst. of Psychology, Moscow, USSR) **Sistema priznakov diya mashinnogo raspoznaniya rukopisnykh slov.** [A system of signs for machine recognition of words in cursive letters.] *Voprosy Algoritmizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 210-225.—Presents materials from experimental studies on machine identification of cursive writing. While, in the proposed system of indices to be employed, 3 pairs of letters are in principle indistinguishable from each other (the cyrillic E-S, I-Ts, Sh-Shch), that fact does not affect the degree of accuracy of identifying whole words in cursive writing.—*I. D. London*.

664. Weaver, Wendell W., Holmes, C. Curtis, & Reynolds, Richard J. (U. Georgia, Coll. of Education) **The effect of reading variation and punctuation conditions upon reading comprehension.** *Journal of Reading Behavior*, 1970 (Win), Vol. 2(1), 75-84.—18 undergraduate Ss were randomly assigned to 1 of 6 groups in a 2 x 3 factorial with reading variation (silent reading, reading last word of sentence aloud, and reading aloud) and presence or absence of punctuation as independent variables. 4 paragraphs differing in level

of context difficulty according to J. Bormuth's scale were given to each S, with every 5th noun (up to 20) deleted. The dependent variable was reading comprehension as measured by a noun cloze test, the sum of individual test item latencies, time required to read each passage, and time required to take an oral test. Results of the repeated measures analysis indicate a significant effect for context difficulty over all measures except total test time. A main effect of reading variation was found for the cloze test and total reading time, and a significant interaction between reading variation and punctuation was found for the cloze test. The cloze test and item latency measures indicate a trend in difficulty level inconsistent with that suggested by Bormuth. Results are discussed in terms of the task and test requirements.—*R. Wiltz*.

Psycholinguistics

AESTHETICS

665. Jaffe, Harold & Tytell, John. (Eds.) (Long Island U.) **The American experience: A radical reader.** New York, N.Y.: Harper & Row, 1970. xiii, 456 p. \$3.95 (paper).—Compiled to speak directly to college students, this anthology of writings on the contemporary American experience, includes a variety of unconventional forms (manifestoes, speeches, interviews, a symposium, poetry, rock-lyrics, and scenarios).

SMOKING & DRUG & ALCOHOL USE

666. ———. **How total community should confront today's drug-abuse problem.** *Canadian Medical Association Journal*, 1969 (Nov), Vol. 101(11), 8-16.—Summarizes recommendations by the Canadian Medical Association for a "broad, multifaceted program for the control of the misuse of drugs" in Canada. It is felt that: (a) control of cannabis should be maintained until adequate information has been obtained on its long-term effects; (b) "drug categorization, legislative control and penalties need complete rethinking"; and (c) a coordinate program of drug control and help for users is needed. Current knowledge, emphasizing psychoactive drugs, and adolescent and nonmedical drug use is examined. The team approach, education programs, crisis centers and facilities for chronic users, compulsory treatment of heavy users, control of hazardous substances and over-the-counter drugs, and research are advocated.—*G. Steele*.

667. ———. **Non-medical use of drugs with particular reference to youth.** *Canadian Medical Association Journal*, 1969 (Dec), Vol. 101(13), 804-820.

668. Forbes, Gordon B. (Millikin U.) **Smoking behavior and birth order.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 766.—Found that increases in birth rank are associated with smoking frequency increases in 804 college students.

669. Schneider, Nina G. & Houston, John P. (U. California, Los Angeles) **Smoking and anxiety.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 941-942.—460 of 1025 contacted individuals completed the Taylor MA scale and a questionnaire on smoking behavior. Data indicate that smokers, as a group, scored higher on the anxiety scale than nonsmokers. No support for the notion of a significant correlation between amount of smoking and level of anxiety was obtained. Ss reported

increases in smoking behavior during periods of stress but indicated that these increases were usually not maintained beyond the period of stress.—*Journal abstract*.

670. Silberman, D. & Levy, J. (Monash U., Victoria, Australia) **A preliminary survey of 24 Victorian marijuana users.** *Medical Journal of Australia*, 1969 (Aug), Vol. 2(6), 286-289.—Compared 24 marijuana users with matched controls using a yes/no questionnaire technique. Attitudes and personal characteristics differed systematically between groups. Most of the drug group identified closely with its usage, and were to some extent a social outgroup. A small number could not, apart from the facts of actual usage, be distinguished from the controls. Aspects of the drug experience, the associated personalities, and the usual consequences of usage are discussed. The usual stereotypes of marijuana users did not apply.—*Journal abstract*.

PERSONALITY

671. Aaronson, Bernard S. (Bureau of Research in Neurology & Psychiatry, Princeton, N.J.) **Drugs: Personality: Personality: Drugs.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 811-818.—The concepts, drug and personality, are conceptually similar, fulfill similar functions, and are defined by similar operations in their respective domains. A monistic concept is set forth and some implications of extending methods from personality psychology to pharmacology and from pharmacology to personality psychology are examined. (38 ref.)—*Journal abstract*.

672. Crookes, T. G. & Pearson, P. R. (St. John's Hosp., Aylesbury, England) **WAIS IQ, Sixteen PF B score and education.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 348-349.—Compared scores on the WAIS and 16 PF for 40 patients. The Verbal IQ of the SAIS was most related to education. The results agreed with previous research in that the correlations of Factor B on the 16 PF with the WAIS are insufficient to allow one to be substituted for the other.—*E. J. Kronenberger*.

673. Kelly, George A. (Brandeis U.) **The role of classification in personality theory.** *Public Health Service Publication*, 1968, No. 1584, 155-164.

674. Kostyuk, G. S. (Inst. of Psychology, Kiev, USSR) **Razvitiye leninskikh idei v sovetskoi psikhologii lichnosti.** [The development of Lenin's ideas in Soviet psychology of personality.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 3-24.—Lenin's doctrine of the social nature of personality has been developed by Soviet psychologists along the lines of dialectic materialism and social determinism. External factors give rise to action (by the personality) by way of internal processes. The role of the social group in personality development is emphasized, especially in the course of development of the child, which has been studied extensively by Soviet psychologists. (English summary) (77 ref.)—*L. Zusne*.

675. Krutetskii, V. A. **Yubilei uchenogo.** [Anniversary of a scientist.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 168-169.—Presents an appreciation on the occasion of the 80th birthday of Nikolai Dmitrievich Levitov, a Soviet psychologist, author of many books, whose work over the past 50 yr. has been mainly in the area of personality.—*L. Zusne*.

676. Williamson, R. W., Heckel, R. V., & Boblitt, W. E. (U. South Carolina) **Reported frequency of dream**

recall as related to repression-sensitization and intelligence. *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 300-301.—143 male and female Ss were administered the Welsh H and Welsh R scales of the MMPI, the Shipley scale, and answered questions concerning their dreams. Sensitizers were found to have significantly higher dream recall scores than repressors. Females had significantly more dream recall than did males. Differences in intelligence and the interaction between intelligence and the repression-sensitization variable did not differ significantly.—*E. J. Kronenberger*.

PERSONALITY TRAITS & PROCESSES

677. Berk, Bernice E. (New York U.) **Some structural and functional aspects of the self-concept.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5232.

678. Bone, Ronald N. & Montgomery, Doil D. (West Virginia Wesleyan Coll.) **Extraversion, neuroticism, and sensation seeking.** *Psychological Reports*, 1970 (June), Vol. 26(3), 974.—Examined the relationship of extraversion and neuroticism to the Sensation-Seeking Scale (SSS). Using the MPI as a measure of extraversion and neuroticism, results with 260 undergraduates indicate that the SSS is significantly related, for both sexes, to extraversion but unrelated to neuroticism.—*Author abstract*.

679. Clouser, Randall A. & Hjelte, Larry A. (Villanova U.) **Relationship between locus of control and dogmatism.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 1006.—Hypothesized that externally controlled Ss when compared to internally controlled Ss would be significantly more dogmatic based on theoretical similarities between the Rotter internal-external (I-E) and dogmatism constructs. Results with 241 undergraduates confirmed the hypothesis and suggest that dogmatism may be a correlate of the I-E construct.—*Author abstract*.

680. Gaddini, Eugenio. **On Imitation.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 475-484.—Identification can be distinguished from imitation but the relationship has not been sufficiently clarified. Imitation seems to be an essential element of the structure of identification, as is introjection, but it expresses a basic disposition towards the object, which should be distinguished from that of introjection. To imitate not only does not mean to introject, but may be a way of defending oneself from the anxiety provoked by introjective conflicts, even if this defense may in turn cause more serious pathological pictures. In the process of identification, imitations and introjections are fused and integrated in the service of the aims of adaptation and of the reality principle. Some of the different types of identification may be described as different pathological aspects of it, and the elementary mental processes which underlie some somatic pathological aspects may be better understood.—*Journal summary*.

681. Holmes, George R. (U. South Carolina) **The identification of social approval factors as sub-components of social desirability and acquiescence.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5239.

682. LeUnes, Arnold D. (North Texas State U.) **The relationship between self-concept and authoritarianism and certain academic, vocational, and biographical variables of college freshmen.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5225.

683. Spiegler, Michael D. & Liebert, Robert M. (Veterans Administration Hosp., Palo Alto, Calif.) **Some correlates of self-reported fear.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 691-695.—Assessed the relative fearfulness of 349 13-85 yr. olds using a self-report inventory consisting of subscales containing realistic and unrealistic fears. Women reported more fear than men. Age differences appeared in a U shaped pattern from adolescence to senior citizenry for realistic fears. For unrealistic fears there were no significant age differences. Highly reliable positive correlations were found between self-reported fear and social desirability. The pattern of results is discussed in terms of age and sex roles.—*Journal abstract.*

684. Templer, Donald I. & Dotson, Elsie. (Carrier Clinic, Belle Meade, N.J.) **Religious correlates of death anxiety.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 895-897.—No significant relationships between Death Anxiety Scale score of 213 undergraduates and several variables of religious affiliation, belief, and activity were obtained. The absence of any such relationship was explained in terms of religion having a limited effect upon the attitudes and behavior of most college students in our society.—*Journal abstract.*

685. Weissman, Herbert N. & Ritter, Kenneth. (Temple U.) **Openness to experience, ego strength and self-description as a function of repression and sensitization.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 859-864.—Attempted to determined whether persons differing in defensive style (the Repression-Sensitization scale) also differ systematically in their degree of openness to experience, ego strength (Es), and personality functioning as measured by the Adjective Check list (ACL). Using 3 groups of undergraduates, high sensitizers, relative to their more repressed counterparts, were more open to experience, differed significantly on a large number of ACL scales and were no lower on Es than median repression-sensitization persons. Findings suggest that sensitizers, while critical, impatient, action-oriented, and personally more troubled, also have the capacity for personal integration (Es) and for more creative potential than indicated in previous literature.—*Journal abstract.*

Behavior Correlates

686. DeLeon, Patrick H. (Purdue U.) **Concomitants of self disclosing behavior.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5235.

687. DeWolfe, Thomas E. (U. Houston) **Criminal or mentally ill? Some correlates of labelling law-breaking deviants.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5064-5065.

688. Golightly, Carole & Reinehr, Robert C. (Austin State Hosp., Tex.) **Authoritarianism and choice of a military milieu.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 854.—Administered the California F Scale to 77 male students who had served a compulsory 2 yr. in a cadet corps before choosing to leave or remain. Results suggest a curvilinear relationship between authoritarianism and choice of a military milieu, with Ss who remain in a military milieu being of moderate to moderately high authoritarianism.—*Author abstract.*

689. Gorman, Bernard S. (Queens Coll., City U. New York) **16 PF correlates of sensation-seeking.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 741-742.—Administered to 64 undergraduates Zuckerman's

Sensation-Seeking Scale and Cattell's 16 PF. High sensation-seekers were characterized by greater dominance, surgency, adventurousness, suspicion, and bohemian unconcernedness and by less shrewdness and self-sentiment control than low sensation-seekers. This pattern was more pronounced for women than men. The relationship of this constellation to psychopathy is discussed.—*Journal abstract.*

690. Looft, William R. (Iowa State U.) **Egocentrism and social interaction in young and old adults.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5225-5226.

691. Moore, Charles H. & Ascough, James C. (East Carolina U.) **Self-acceptance and adjustment revisited: A replication.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 855-858.—Attempted to replicate research by C. Taylor and A. W. Combs (see PA, Vol. 27:2597) with undergraduates. The list of damaging statements was modified for an older population and the California Test of Personality (CTP) was used as a measure of adjustment. Data were collected for 79 Ss who were asked to identify themselves. Critical ratios were not significant and a correlation of .01 between indices was obtained. When the measures were later administered to 109 Ss without requiring names, $r = .04$. Inspection showed that results for Ss in the CTP middistribution were in predicted directions but that scores for Ss at the extremes were reversed. Results are discussed in terms of neurotic symptoms and stable adult behavior.—*Journal abstract.*

692. Rashid, Muhammad A. (Purdue U.) **Need achievement and academic and job success.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5227-5228.

693. Von Singer, Ron & Pederson, M. Gordon. (Marquette U.) **Behavioral correlates of the ACL Heterosexual scale.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 719-722.—Investigated specific behaviors which relate to high and low scores ($\pm 1\frac{1}{2}$ standard deviations) on the Heterosexual scale of the Adjective Check List. The Gough Adjective Check List and a structured telephone survey of 23 questions were administered to 36 male undergraduates. This survey yielded significant behavioral differences between the 2 groups. The high group's behavior tended to be more assertive, more involved in formal dating practices, and generally more mature.—*Journal abstract.*

694. Lester, David. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Animism and intolerance of ambiguity.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 966.—Hypothesized that Ss who classify nonliving objects as living were more able to tolerate a less well-defined categorizing system. No association was found between animistic responses to a questionnaire and intolerance for ambiguity in 49 female undergraduates. There is no adequate explanation for why Ss respond animistically.—*Author abstract.*

INTELLIGENCE

695. Gravitz, Herbert L. (U. Tennessee) **Examiner expectance effects in psychological assessment: The Bender Visual Motor Gestalt Test.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5238.

696. Inaba, Syotaro. (U. Tokyo, Inst. of Industrial Science, Japan) [New aptitude test induced by controllability by man.] *Japanese Journal of Psychology*, 1969 (Oct), Vol. 40(4), 201-211.

cortex, had its own genesis, and was connected with a definite neuronal function. The properties of the initial negative phase make evident that it was the result of physical propagation of potential from a specific cortical area. The 2nd phase (positive) reflected the activity of structures, picking up afferent signals. Evidence for this was its comparatively short latent period, as well as the synchronous responses of neurons identified in most cases as afferent (transmissive) neurons. The cortical level of its generation was 800-1200 microns. The 3rd phase (slow negative) appeared to be the result of excitation of the cortical motor cells. With slowly reiterated stimuli (about 2/sec), it summated with the negative phase of afteraction discharge which reflected the activity of inhibitory neurons. Comparison of the reactions of the neurons of the orbital cortex with the changes in excitability of the effector projections against a background of conditionalizing stimulation of afferent nerves led to the conclusion that the inhibitory interval of afferent neurons is secured by systems facilitating effector reactions. (English summary) (31 ref.)—*I. D. London*.

308. Kratin, Yu. G., Zavorotnyi, A. I., Petrov, Yu. N., & Sokolov, A. N. (Pavlov Inst. of Physiology, Leningrad, USSR) *Prostoi chastotnyi amplitudno-porogovyi avtomaticheskii analizator EEG*. [A simple automatic frequency amplitude-threshold EEG analyzer.] *Fiziologicheskii Zhurnal SSSR*, 1969 (Sep), Vol. 55(9), 1163-1166.—Discusses the theory and design of the automatic EEG analyzer and details the circuits involved. The essence of the method consists in signals from each frequency filter being separately and automatically distributed, with respect to the amplitude of each oscillation, to 1 of several levels, the number and significance of which are established earlier in correspondence with the aim of the investigation undertaken.—*I. D. London*.

309. MacCulloch, M. J. & Atkinson, J. (U. Birmingham, England) *A simple method for adapting portable E.E.G. machines for use as polygraphs*. *Acta Psychiatrica Scandinavica*, 1968, Vol. 44(4), 410-414.—Describes the electromagnetic conversion unit which renders the magnetic changes occurring in the primary relays suitable for acceptance by any standard EEG machine.—*Journal summary*.

310. Majkowski, Jerzy & Morgades, Pilar P. (Medical Academy, Clinical & Experimental EEG Lab., Warsaw, Poland) *Primary auditory evoked potentials after section of brachium of the inferior colliculus*. *Electroencephalography & Clinical Neurophysiology*, 1969 (Dec), Vol. 27(6), 587-593.—Studied the primary auditory evoked potentials (PAEPs) in acute and chronic experiments before and after section of the brachia of the inferior colliculus (BIC) under nembutal and alpha-chloralose anesthesia, without anesthesia and during electrical stimulation of inferior colliculi (IC). Out of 20 cats, 5 are presented in detail. The section of BIC resulted in disappearance of PAEPs recorded from auditory cortex A1, regardless of the type of anesthesia and in cats without anesthetics, during auditory and electrical stimulation of IC. This effect lasted for several mo. Results are discussed from the viewpoint of relative specificity of the pathways in reticular formation which would transmit the auditory impulses to levels above section of BIC. (French summary) (17 ref.)—*Journal summary*.

311. Nash, Michael D. & Fleming, Donovan E. (Temple Buell Coll.) *The dimensions of stimulus complexity and the visually evoked potential*. *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 171-177.—Investigated the relationships between 5 dimensions of complex stimuli and the latency, waveform, and amplitude of the visually evoked potential (VEP) of 8 male Ss in 3 experiments. The stimulus variable, contour density, emerged as the most consistent predictor of VEP amplitude. Contrary to earlier reports, changes in either latency or waveform were not observed, and linearity was the most frequent form of the relationship between the stimuli and amplitude measures. (French & German summaries) (18 ref.)—*Journal abstract*.

312. Peck, Carol K. (U. California, Los Angeles) *Behavioral and electrophysiological responses in a two-flash discrimination task in the cat*. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5262.

313. Semenovskaya, E. N., Bogoslovskii, A. I., & Zhdanov, V. K. (Helmholtz Research Inst. of Eye Diseases, Moscow, USSR) *Vyzvannye svetom potentsialy u zdorovykh lyudei i u bol'nykh s razlichnym urovnem lokalizatsii patologicheskogo protessa v zritel'noi sisteme*. [Photically evoked potentials in healthy persons and in those with different levels of localization of the pathological process in the visual system.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 102-109.—85 patients, with variously located affections of the visual system (pathological states of the optic nerve: different diseases of the retina with diencephalic failure to regulate intraocular pressure, glaucoma, and amblyopia), were Ss in a study employing, as indices, evoked potentials and electroretinograms. The careful study of cortical evoked potentials in combination with the application of a composite of electrophysiological techniques can help considerably to establish the character and topical nature of the lesion in the visual organ.—*I. D. London*.

314. Sologub, E. B. (Lesgaft Inst. of Physical Culture, Leningrad, USSR) *Medlennye potentsialy EEG v tempe dvizheniya kak odna iz form rabochei aktivnosti kory bol'shikh polusharii*. [EEG slow potentials in the tempo of movement as one of the forms of working activity of the cerebral cortex.] *Fiziologicheskii Zhurnal SSSR*, 1969 (Sep), Vol. 55(9), 1049-1058.—70 adults "with different occupational and athletic specialization and qualifications" were studied while performing intense muscular activity (running in place, mock rowing, etc.). EEG slow potentials with an amplitude of 50-100 microV., in rhythm with the tempo of movement, is 1 of the most characteristic forms of cortical electrical activity. EEG slow potentials, in rhythm with the tempo of movement, were more stably manifested in persons who were the best trained for a given type of muscular performance and varied considerably with respect to temporal and spatial parameters in poorly trained Ss. Cortical localization of slow potentials, in rhythm with the tempo of movement, was a function of stage of formation of the motor dynamic stereotype: (a) more marked irradiation and their predominance in the right hemisphere in the beginning and middle stage of mastering a movement, and (b) local manifestation in limited zones of the cortex (motor and lower parietal areas of the left hemisphere) in the concluding stages of development of the stereotype. Slow potentials, in rhythm with the tempo of movement, appeared in the

period of development and during fatigue in different cortical functional structures; but during the steady state in muscular performance, especially in highly trained athletes, they were concentrated within the bounds of 1 functional structure. (English summary) (22 ref.)

SENSORY PHYSIOLOGY

315. Chapman, Harold W. (U. Pennsylvania) **Oropharyngeal determinants of non-regulatory drinking in the rat.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5252.
316. Demirchoglyan, G. G. (Visual Reception Lab., Erevan, USSR) **Novye dannye o mekhanizmaxh deistviya ioniziruyushchego izlucheniya na funktsional'nye svoystva retiny.** [New data on the mechanisms of action of ionizing irradiation on the functional properties of the retina.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 114-117.—Reports results of studies on the influence of ionizing radiation upon frog retina, utilizing electroretinograms (ERGs) from isolated retina, bathed in nutrient liquid. Under the action of X rays, the b-wave of the ERG was reduced. The response to X-ray stimulation (5 r/sec) was similar to that from the retinal ERG, resulting from a corresponding photic stimulus.—I. D. London.
317. Marveev, A. B. (Energy Inst., Moscow, USSR) **O nekotorykh psikhofiziologicheskikh zakonamernostyakh vospriyatiya tsвета, opisyyaemykh nelineinoy model'yu.** [On some psychophysiological operational characteristics of color perception, described by a nonlinear model.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 19-26.—Develops a mathematical model of the visual organ, based on spectral sensitivity curves for 3 color-sensing receptors—curves which coincide with the composition curves of N. D. Nyuberg and E. N. Yustova. "Normalizing the equations" is made on the basis of data on the discrimination of 25 colors of the same brightness, supplied by D. L. MacAdam (see PA, Vol. 16:3470). It appears that (a) "for the red- and green-sensing receptor the relationship of sensation and color is [one that is] closer to the linear than [is the case] for the blue receptor," and (b) "all achromatic colors, therefore, are distributed in the color space hyperbolically, convexly in the direction of the axis of the blue-sensing receptor." The hypothesized displacement of a white spot in the functional relationship between object and background brightness is confirmed experimentally.—I. D. London.
318. Ostrovskii, M. A. & Polyak, S. E. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **O gistokhimicheskoi raznorodnosti nervnykh elementov setchatki (na primere raspredeleniya aktivnosti kisloi fosfatazy).** [On the histochemical heterogeneity of the retinal nerve elements (on the example of the distribution of acid phosphatase activity).] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 155-157.—Presents a histochemical study of the distribution of acid phosphatase activity in frog retina in order to elucidate the functional differences with respect to this enzyme among the retinal elements, in particular, the cells of the internal nuclear layer. Deposits of lead sulfide, testifying to the presence of enzymatic activity, was distinctly in evidence in the ganglionic cells, Müllerian fibers, and the horizontal cells of the internal nuclear layer. Deposits were not observed in the bipolar cells of this layer or in the photoreceptors.—I. D. London.
319. Samsonova, V. G. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Puti razvitiya fiziologii zreniya i fiziologicheskoi optiki v SSR za 50 let.** [Paths of development of the physiology of vision and physiological optics in the USSR for the last 50 years.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 3-7.—Presents a historical review of the direction and scope of research.—I. D. London.
320. Shklover, D. A. (All-Union Research Phototechnical Inst., Moscow, USSR) **Modellirovanie protsessa tsvetovogo zreniya u cheloveka.** [Modeling the process of color vision in man.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 8-18.—Develops a mathematical model of the process of human color vision, whose output signals correspond to experimental functions procured under certain conditions of observation. A number of the operational characteristics of human color can be explained with the aid of the model. An electronic model is constructed which reproduces the main functions of human color vision and which is utilizable for the development of photoelectric methods of color measurement. Questions dealing with the capacity of the eye to discriminate color under different conditions of observation are investigated with the aid of this model.—I. D. London.
321. Shukolyukov, S. A. & Étingof, R. N. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **Primenenie kislotno-osnovnykh indikatorov dlya izucheniya izmenenii pH pri osveshchenii naruzhnykh segmentov fotoretseptorov setchatki i rodopsina.** [Application of acid-base indicators for studying pH changes under illumination in rhodopsin and the outer photoreceptor segments of the retina.] *Biofizika*, 1970 (Jan), Vol. 15(1), 112-119.—Isolated fractions of outer segments of bovine retina containing membrane structures with rhodopsin were used in a study showing that these segments have the capacity to bind the indicator, bromthimol blue, unlike the case with the indicator, bromcresol purple. Rhodopsin, in the form of digitonin micellae also bound bromthimol blue. Also, the constant of dissociation (pK) shifted from 7.1-8.5. The union of bromthimol blue with rhodopsin did not alter the differential spectrum of the latter. With illumination of the "dark" segments there were observed under certain conditions (a) an increase in the absorption of the indicator, bromcresol purple, and (b) a decrease in that of the indicator, bromthimol blue.—I. D. London.
322. Snyakin, P. G. & Anisimova, A. P. (Inst. of Normal & Pathological Physiology, Moscow, USSR) **Setchatka kak vyrazitel' faz korkovoi induktsii.** [The retina as expresser of the phases of cortical induction.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 68-71.—Studied positive and negative cortical induction, whose intensity is gauged through utilization of retinal lability as index of strength of induction. The formation of retinal CRs, differentiation, etc., as well as the phases of positive and negative induction between the centers of different analyzer systems, is reflected in the level of sensitivity of the retina and in its effector reactions. CSs were the sound of a metronome, the smell of vinegar, mechanical stimulation of the skin (rhythm of 60/min), etc.—I. D. London.
323. van Hof, M. W. (Medical Faculty, Rotterdam.

697. Koppitz, Elizabeth M. (Board of Cooperative Educational Services, Yorktown Heights, N.Y.) **The Visual and Aural Digit Span Test with elementary school children.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 349-353.—Attempted to secure normative data for children without learning disabilities on the Visual Aural Digit Span Test. No significant differences were found for sex or for mode of reproduction but the results were influenced by age with older Ss doing better than younger Ss. Visual presentation resulted in better recall than did aural presentation.—E. J. Kronenberger.

698. Looft, William R. (U. Wisconsin) **Note on WAIS Vocabulary performance by young and old adults.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 943-946.—Analysis of WAIS Vocabulary performance of 56 young adults (mean age about 19 yr.) and 39 old adults (mean age about 77 yr.), equated for educational level, showed that the average performance of the younger group was significantly higher. An examination of the responses of the 2 age groups to specific items suggested generational change in degrees of understanding and the kinds of referents for several words.—*Journal abstract.*

699. Majumdar, P. K., Dasgupta, J., Basu, K., & Dutta, D. **On the working of a battery of psychological tests: Raven's Standard Progressive Matrices Test.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1967 (Jul), No. 9., 1-6.—Presents a normative study of Raven's Standard Progressive Matrices Test along with a few other cognitive ability tests on 2836 higher secondary students of Calcutta, India. Normative studies for different subgroups were undertaken and the order of placement of the different subsets of the test in the total scale continuum were verified. No significant difference in the overall difficulty value of Set C with that of Set D was noticeable. However, results indicate that Set D might precede Set C in the scale continuum.—*Journal abstract.*

700. Miller, Charles K., Chansky, Norman M., & Gredler, Gilbert R. **Rater agreement on WISC protocols.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 190-193.—Investigated the degree of agreement among psychologists in training in scoring WISC protocols. It is suggested that discrepancies between raters can be accounted for by (a) responses to items not clearly accounted for in the manual, (b) failure to follow explicit guidelines set by Wechsler in relation to cutoff criteria and prorating procedures, and (c) clerical errors.—H. Kaczkowski.

701. Saunders, David R. & Gittinger, John W. (U. Colorado) **Patterns of intellectual functioning and their implications for the dynamics of behavior.** *Public Health Service Publication*, 1968, No. 1584, 377-390.

702. Smith, Richard B. & Mangum, Robert. **Delayed recall versus recognition as a predictor of higher level cognitive achievement.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 167-171.—Compared the performance of college students who can recall a principle after a period of years as opposed to those who can only recognize the principle. Blom's Taxonomy served as a guide for constructing items to judge the ability to profit from communication. Results indicate that recall is superior to recognition in predicting ability to form inductive and deductive conclusions.—H. Kaczkowski.

703. Watkins, J. T. & Kinzie, W. B. (U. South Dakota) **Exaggerated scatter and less reliable pro-**

files produced by the Satz-Mogel abbreviation of the WAIS. *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 343-345.—Presents a partial replication of the original work of the Satz-Mogel WAIS abbreviation. The results substantiated the findings of Satz and Mogel but also found that their short form was characterized by a highly significant increase in variance, by profiles which were not highly and consistently related to the pattern of subtest scores, and exaggerated scatter and potential for distortion. The implication of the study was that abbreviated subtests will tend to yield less reliable profile data.—E. J. Kronenberger.

CREATIVITY

704. Smith, George P. (North Texas State U.) **The relationships among selected variables of creative thinking and visual, auditory, and tactual sensory perception.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4839.

PERSONALITY MEASUREMENT

705. Boon van Ostade, A. H. **Rokeach' dogmatisme-schaal: Duidelijker resultaten met iteratieve cluster analyse.** [Rokeach's Dogmatism Scale: Clearer results with iterative cluster analysis.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970 (May), Vol. 25(5), 322-323.—Reference is made to L. Hagendoorn's (see PA, Vol. 44: 13617 and 44:14631) research about the dubious reliability and validity of Rokeach's Dogmatism Scale. It is suggested, by means of supporting data, that iterative cluster analysis can provide more adequate results with the Rokeach scale than by component analysis, which was the research technique used by Hagendoorn.—A. J. Ter Keurst.

706. Hundal, P. S., Singh, Agyajit, & Singh, Mohinder. (Punjab U., Chandigarh, India) **Factor analytical study of tests of anxiety.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 875-878.—Administered Taylor's MA scale, the Neuroticism scale of the MPI, Cattell's Anxiety Scale Questionnaire, and Dutt's Anxiety Questionnaire to 200 male Indian graduate students. 2 indices of academic achievement and 3 measures of physique were also noted. Data were processed by principal axis method of factor analysis. 4 factors were extracted and interpreted.—*Journal abstract.*

707. Lunneborg, Patricia W. & Lunneborg, C. E. (U. Washington) **Factor structure of MF scales and items.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 360-366.—Masculinity-femininity (MF) items from 4 scales were administered to 169 college sophomores. A factor analysis of the results was obtained and is presented. There were 2 principal axis factors. 11 factors were extracted from the intercorrelations: feminine interests, emotional sensitivity, philistine vs. artistic, self-confidence, masculine interests, rejection of adventure, neurotic symptoms, indifference, social adequacy, extraversion, and unsocial nonconformity. Of the 11, 5 were considered true MF dimensions.—E. J. Kronenberger.

708. MacDonald, A. P. (West Virginia U., Rehabilitation Research & Training Center) **Revised scale for ambiguity tolerance: Reliability and validity.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 791-798.—Increasing the 16-item Rydell-Rosen Ambiguity Tolerance (AT) Scale to 20 items raised the reliability from

.64 to .86. The 20-item scale (AT-20) was cross-validated on a sample of 789 undergraduate Ss. Retest reliability was estimated at .63 ($p < .01$) for a 6-mo interval. AT-20 related to: (a) performance in a complex task, (b) the California F Scale, (c) dogmatism, (d) rigidity, and (e) church attendance. The AT-20 was not affected by social desirability response-bias as measured by the Marlow-Crowne Social Desirability scale. (17 ref.)—*Journal abstract*.

709. Stein, Morris I. & Neulinger, John. (New York U., Research Center for Human Relations) **A typology of self-descriptions.** *Public Health Service Publication*, 1968, No. 1584, 390-403.

710. Veldman, Donald J. & Parker, George V. (U. Texas) **Adjective rating scales for self description.** *Multivariate Behavioral Research*, 1970 (Jul), Vol. 5(3), 295-302.—Factor analysis of Gough's 300-item Adjective Check List identified 8 highest-loading items for 7 factors of self-perception. These were alphabetized and presented with 5-point scales to 713 females in teacher training. Factor analysis of the 56 self-rating items replicated the original structure, and simple scale sums showed satisfactory internal consistency and test-retest stability. Correlations with another self-description inventory evidenced concurrent validity of the instrument, which should be valuable for rapid, straightforward, quantified self-description.—*Journal abstract*.

711. Wilson, Glenn D. & Patterson, John R. (Inst. of Psychiatry, London, England) **The Conservatism Scale.** Windsor, England: NFER Publishing Co., 1970.—Describes the Conservatism Scale (C-Scale) designed to measure the general factor underlying social attitudes, variously labeled "authoritarianism," "fascism," "dogmatism," "rigidity," "preservationism," and "antiscientific attitude." Extreme high scorers on the C-Scale may be expected to show: (a) religious dogmatism; (b) right-wing political orientation; (c) insistence on strict rules and punishments; (d) ethnocentrism, and intolerance of minority groups; (e) preference for conventional art, clothing, and institutions; (f) anti-hedonism (a tendency to regard pleasure as bad); and (g) superstition and resistance to scientific progress. Positive intercorrelations among these attitude clusters are now confirmed in several different cultures. The propositional-statement form of previous attitude scales has been abandoned in the C-Scale, and a new item format introduced which gives it unique economy as a psychometric instrument without sacrificing reliability or validity.—P. McMillan.

Inventories

712. Boff, M. M. (U. Pittsburgh) **The M-F scale: Yesterday and today.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(2), 92-96.—Studied the measurement of masculinity-femininity (M-F) by scales so labeled on personality inventories. 120 items from 3 representative scales were administered to 2 successive samples of university freshmen women and 11th grade high school girls who responded to the items in terms of their "ideal woman." 18 discriminating items were then administered to a sample of 48 men and 45 women in an introductory psychology class. Results showed rejection of more than $\frac{1}{2}$ of the items originally keyed as feminine, and little difference in response by sex.—S. M. Amatora.

713. Brown, J. R. (U. Bridgeport) **Edwards Personality Inventory, Booklet IV: Faking and faking detection.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(2), 86-88.—55 experimental and 53 control Ss completed Booklet IV of the Edwards Personality Inventory. The former were instructed to fake in order to make an excellent impression while concealing their faking; the latter were instructed to be honest and forthright. Differences between experimental and control group means were small and reached significance for only 3 of the 13 variables. An attempt to use the Virtuous scale as a lie scale to detect faking had only modest success.—S. M. Amatora.

714. Edwards, Allen L., Abbott, Robert D., & Klockars, Alan J. (U. Washington) **Social desirability and the TSC scales: A replication and reply to Stein.** *Multivariate Behavioral Research*, 1970 (Jul), Vol. 5(3), 325-327.—A replication of a study by A. L. Edwards, A. J. Klockars, and R. D. Abbott (see PA, Vol. 44:16709) using Tryon's sample, i.e., male adults instead of male undergraduates showed that each of the 7 Tryon, Stein, and Chu (TSC) scales had its highest loading on the 1st principal component. Results are in agreement with those obtained with a college sample.—*Journal abstract*.

715. Erdberg, Stephen P. (U. Alabama) **MMPI differences associated with sex, race, and residence in a Southern sample.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5236.

716. Mehryar, A. H. & Shapurian, R. (Paholavi U., Shiraz, Iran) **Some normative data on a Persian form of the New Junior Maudsley Inventory.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 743-746.—Describes characteristics of performance on a Persian translation of the New Junior Maudsley Inventory by 274 boys and 318 girls enrolled in secondary schools. Cross-cultural differences are explored.—*Journal abstract*.

Projective Techniques

717. Urbina, Susana; Harrison, Joan B., Schaefer, Charles E., & Anastasi, Anne. (Fordham U.) **Relationship between masculinity-femininity and creativity as measured by the Franck Drawing Completion Test.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 799-804.—Hypothesized that creative Ss share more of the traits commonly associated with the opposite sex than do noncreative Ss. The Franck Drawing Completion Test (FDCT) protocols of 240 high school students, equally divided in terms of sex and creative vs. control status, were analyzed. Results confirmed the validity of the masculinity-femininity (M-F) scale of the FDCT for adolescents ($p < .001$) but did not support the hypothesis as the FDCT does not measure those aspects of the M-F variable which creative Ss share with the opposite sex. Previous studies have also confirmed its validity as a measure of M-F but have been unable to specify which aspect of M-F it taps.—*Journal abstract*.

Rorschach Test

718. Boreham, John. (Tavistock Clinic, London, England) **A theoretical contribution to the understanding of the shading responses.** *British Journal of Projective Psychology & Personality Study*, 1968 (Jun), Vol. 13(1), 13-15.—Hypothesizes that (a) "depth shading responses relate not to anxiety in general, but more specifically to depressive anxiety," and (b) phobic

anxiety is found in inanimate movement responses and threatening response content. It is suggested that these basic anxiety situations are rarely found in pure form, and a projective test should reflect their many manifestations.—*P. McMillan.*

719. **Friedemann, Alfred.** (International Rorschach Society, London, England) **The history of Rorschach.** *British Journal of Projective Psychology & Personality Study*, 1968 (Jan), Vol. 13(1), 3.—Reviews the history of the development of the Rorschach test from the appearance of the 1921 monograph entitled "Psychodiagnostik" through the establishment of the International Rorschach Society in Berne in 1952, to the 7th International Rorschach conference in London.—*P. McMillan.*

CLINICAL PSYCHOLOGY

720. **Becuș, T. & Feszt, T.** **Contribuții la studiul mucoproteinuriei cu reacția Donaggio în afecțiuni neuropsihice.** [Contributions to the study of mucoproteinuria by the Donaggio test in neuropsychical diseases.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Jan), Vol. 13(1), 31-38.—Determined urinary mucoproteins by the Donaggio test in 45 cases of multiple sclerosis, and compared results with those obtained in an equal number of neuropsychical patients. In neurotic patients mucoproteinuria was normal. Highest values were obtained in Ss with multiple sclerosis, different neuroinfections, and heredodegenerative and muscular diseases. Moderately increased values were found in Ss with cerebral vascular diseases. (French, German, & Russian summaries) (25 ref.)—*English summary.*

721. **Block, James D., Sersen, Eugene A., & Wortis, Joseph.** (Maimonides Medical Center, New York, N.Y.) **Cardiac classical conditioning and reversal in the mongoloid, encephalopathic, and normal child.** *Child Development*, 1970 (Sep), Vol. 41(3), 771-785.—24 mongoloid 4-11 yr. olds, 29 encephalopathic 6-11 yr. olds, and 77 normal 7-11 yr. olds served as Ss. During initial conditioning (10 stimulus pairs) only the oldest normal group evidenced significant stimulus discrimination. During subsequent reversal (10 stimulus pairs), both the oldest and an intermediate normal group evidenced significant discrimination. Mongoloids and the youngest normal group evidenced no consistent cardiac discrimination. Encephalopathic Ss evidenced significant discrimination during reversal, but in a manner inappropriate to the reinforcement contingencies. This behavior, unique in both CA and MA comparisons of encephalopathics with mongoloids and normals may be related to a somewhat impaired conditioning and a more greatly impaired extinction process, or to a deficit in the Pavlovian postulated process of CNS mobility. (24 ref.)—*Journal abstract.*

722. **Bowlby, John.** (Tavistock Clinic, London, England) **Disruption of affectional bonds and its effects on behavior.** *Journal of Contemporary Psychotherapy*, 1970 (Win), Vol. 2(2), 75-86.—Notes that it is proving productive to view many psychoneurotic and personality disturbances as a reflection of a disturbed capacity for making affectional bonds due to faulty development in childhood or subsequent derangement. A review of studies of childhood loss in different psychiatric populations consistently shows 2 psychiatric syndromes—psychopathic personality and depression

—and 2 sorts of associated symptoms—persistent delinquency and suicide—to be preceded by disrupted bonds during childhood. Although data have not yet conclusively demonstrated that brief separations from parents produce disequilibrium in children, that long or repeated separations are causally or genetically related to subsequent personality disorders, it is suggested that: (a) disturbed adult behavior represents a persistence over yr. of deviant patterns of bonding established during childhood, and (b) a principal way in which genetic factors influence mental health is by their effect on bonding behavior. It is concluded that future research should be directed toward bringing together environmental and genetic studies of behavioral disorder. (33 ref.)—*M. Maney.*

723. **Bratfos, Ole; Eltinger, Leo, & Tau, Tove.** (U. Oslo. Psychiatric Clinic, Norway) **Mental illness and crime in adopted children and adoptive parents.** *Acta Psychiatrica Scandinavica*, 1968, Vol. 44(4), 376-384.—Considers whether or not adults who have grown up in adoptive homes are especially disposed to mental disorder. 250 persons born within a 11-yr period, and who had grown up in adoptive homes, were examined with regard to the incidence of mental disorder and crime. The information, derived from the central register of oligophrenia, psychosis and alcoholism, from police files, and from the country's clinical departments, does not indicate that adopted children differ in any special way from the rest of the population. Whether any correlation could be found between mental disorder in adopted children and their adoptive parents was also investigated. There was nothing to indicate that those cases in which such problems were revealed in the adopted children could be traced back to the adoptive parents.—*Journal summary.*

724. **Campbell, Susan.** (McGill U., Montreal, Quebec, Canada) **Cognitive styles in normal and hyperactive children.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5233.

725. **Cash, Larry M. & Kooker, Earl W.** (YMCA Counseling Service, Toronto, Ontario, Canada) **Attitudes toward death of NP patients who have attempted suicide.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 879-882.—Hypothesized that individuals who have attempted suicide would have more inconsistent attitudes toward death than would persons who had not attempted suicide. An attitude toward death scale was devised and administered to 20 neuropsychiatric patients who had attempted suicide, to 20 who had not, and to 40 upper-class and graduate students. Positive, inconsistent, and negative categories were defined in terms of score ranges on the scale. By χ^2 test proportionately more of the suicidal group than of the other 2 fell in the inconsistent category. Scores of both psychiatric groups were distributed differently from those of the normal group and also from each other. (17 ref.)—*Journal abstract.*

726. **David, Henry P.** (International Research Inst., Silver Spring, Md.) **Clinical psychology and social issues in international perspective.** *Journal of Contemporary Psychotherapy*, 1970 (Win), Vol. 2(2), 87-92.—Emphasizes the need for more research and effective international exchanges of information and cooperation especially in the areas of delivery of health services, abortion law reform, and the evolving roles of men and women in modern society. It is suggested that future clinical psychologists will have increasing oppor-

tunities to participate in applied projects with potentials for social action. As this opportunity evolves, psychologists must be prepared to offer practical suggestions to decision makers, and "to join with colleagues in other lands, regardless of ideology, in contributing... toward the amelioration of complex social issues...."—M. Maney.

727. Dey, P. K., Rakshit, Pratima, & Majumdar, Aloke. **Cholinesterase activity and vitamin C relationship in patients of disordered brain functions.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1967 (Jul), No. 9, 11-13.—Studied cholinesterase activity and ascorbic acid level in blood plasma of 30 12-55 yr. old schizophrenics and 10 12-19 yr. old mental deficients. For comparison, a similar biochemical investigation was made on 20 19-40 yr. old normal Ss. Results corroborate previous findings of an association between low cholinesterase activity and low vitamin C level. It is postulated that "low vitamin C level in mentally deficients and in some cases of psychiatric patients may be related to the structural or functional lesion of the higher nervous system," and that administration of high doses of vitamin C in such patients may be beneficial.—M. Maney.

728. Eastwood, M. R., Mindham, R. H., & Tennent, T. G. (Inst. of Psychiatry, London, England) **The physical status of psychiatric emergencies.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 545-550.—Of 100 consecutive patients, 40% had physical abnormalities in addition to the psychiatric problems. Physical screening of emergency patients is suggested because of the high incidence of physical illness.—R. L. Sulzer.

729. Freud, Anna. **A 75th birthday tribute to Heinz Hartmann.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 721.

730. Goldstein, Joseph. **Psychoanalysis and jurisprudence: On the relevance of psychoanalytic theory to law.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 459-479.—Discusses the contributions which psychoanalytic theory may make to law and legal processes. Psychoanalysis attempts to explain human behavior, law attempts to regulate behavior. Conflicts occurring between these 2 ends are discussed. (31 ref.)—B. A. Stanton.

731. Gruenberg, Ernest M. (Columbia U., Coll. of Physicians & Surgeons) **Epidemiology and medical care statistics.** *Public Health Service Publication*, 1968, No. 1584, 76-99.

732. Hartmann, Heinz. **Introductory comments on "Menschen Kennntnis."** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 529-531.—"Menschen Kenner" is a person who has the intuitive capacity of appraising correctly the character of other people. Freud did not consider himself such a person.

733. Mason, Edward A. (Harvard Medical School, Boston, Mass.) **Filmed case material: Experience or exposure?** *American Journal of Orthopsychiatry*, 1969 (Jan), Vol. 39(1), 99-105.—In the conflict arising as a result of the increase in audiovisual case recordings and the mounting concern about protection of patients' rights, contributions from the experience of the medical and legal professions may forestall law suits and serious limitations on the availability of such case records. (16 ref.)—Journal abstract.

734. McNeil, Jesse N., Llewellyn, Charles E., & McCollough, Thomas E. (Duke U., Medical Center) **Community psychiatry and ethics.** *American Journal*

of Orthopsychiatry, 1970 (Jan), Vol. 40(1), 22-29.—Reviews the ethical foundation for community psychiatry and focuses on the specific problems. The ethic of community psychiatry centers in a concern for the common good. Although community psychiatry could develop its own professional code of ethics, attention must be turned to the larger context of the civic community for the ethical values and sanctions that will legitimize and support community psychiatry. 6 primary issues in community psychiatry are discussed: (a) the concept of balance, i.e., focusing on the individual vs. the community's and family's needs and the needs of the masses for care; (b) threats to individual freedom; (c) the delineation of priorities, i.e., community mental health professionals should accept significant responsibility for the broad range of mental patients; (d) systematic evaluation of research programs; (e) the extent and techniques of outward thrust and overcontrol into the community; and (f) ethical issues and public policy. (37 ref.)—A. M. Berg.

735. Miller, Maurice H. & Rabinowitz, Marcia. (New York U., Medical School) **Conditioned orienting reflex audiometry with maternal rubella children.** *Journal of Communication Disorders*, 1970 (Jun), Vol. 3(1), 59-64.—Employed conditioned orienting reflex (COR) audiometry using a pair of flashing red lights mounted next to the loudspeaker in 183 2-3 yr. olds with histories of prenatal rubella. The presence of psychomotor retardation, neurological or behavior disorders markedly reduced the applicability of the test; however, the presence of either heart or eye disorders did not restrict the use of the technique. Reasons for the difficulty in establishing COR conditioning in children with neurological and behavioral disorders are considered.—Journal abstract.

736. Ortmeier, Dale H. (8 E. 77th St., New York, N.Y.) **The we-self of identical twins.** *Contemporary Psychoanalysis*, 1970 (Spr), Vol. 6(2), 125-142.—Personalities of identical twins are rather complementary than identical according to the fraternal twin author. Identification by 1 twin with the other expresses itself in confusion about who has which qualities and capabilities. A case is presented in which the therapist paradigmatically played the role of the patient's twin after standard interpretive technique and silences had failed to produce change. The development of twins and their relationships to each other and to their mother are discussed. (35 ref.)—L. W. Brandt.

737. Predescu, V. & Pirée, S. **Obiective și aspecte ale metodelor investigației cantitative în psihiatrie.** [The objectives and aspects of quantitative methods of investigation in psychiatry.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Sep), Vol. 13(5), 441-456.—Discusses the necessity of furthering our understanding of the pathologic structures of the human psyche, which today demands the use of quantitative, mathematical methods. Conditions which must be complied with in using the quantitative methodology are discussed. (French, German, & Russian summaries) (40 ref.)—English summary.

738. Roose, Lawrence J. **The dying patient.** *International Journal of Psycho-Analysis*, 1969 (Jul), Vol. 50(3), 385-395.—A reasonably logical approach to the treatment of a dying patient can be constructed. An attempt is made to show that denial and regression facilitate the development of a fantasy of reunion. In this state there is comparative peace in the face of death. The development of transference and its effective use are of primary

importance in treatment. Immediate confrontation of the patient by the truth enables the patient to quickly develop a trust in the therapist, who becomes the all-powerful benevolent archaic mother. Truth is re-denied. Denial and regression reinforce each other. This cumulative effect hastens the development of the state of reunion. The manipulation of the transference is used as the basic therapeutic instrumentality rather than interpretation. (28 ref.)—*J. Chyatte*.

739. Rubin, J. M. **Computers in psychiatry.** *Meninger Quarterly*, 1968-1969 (Win), Vol. 22(4), 8-13.

740. Steinfeld, George J. (Clifford Beers Child Guidance Clinic, New Haven, Conn.) **Parallels between the pathological family and the mental hospital: A search for a process.** *Psychiatry, Washington, D.C.*, 1970 (Feb), Vol. 33(1), 36-55.—Reviews theories of Jay Haley and colleagues on the role of the family in the etiology of schizophrenia, especially that communication paradox known as the "double-bind." The pathological family produces a person unable to assume responsibility or to define his relations with others. Total institutions like mental hospitals tend to further make the person nonresponsible. Therapist consistency is seen as a way out of this. If the therapist maintains a consistent attitude (regardless of theoretical position) this forces the patient to respond to him and makes him responsible for his response. Some ways in which hospitals could be more consistent regarding the patient and his environment are indicated. (37 ref.)—*E. Uprichard*.

741. Vitulli, William F. (U. South Alabama) **The sport of behavior: An hypothesis.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 842.—Abnormal behavior, in the statistical meaning, constitutes sporting phenomena. If evolutionary principle functions as a model for what may be expected with respect to behaviorology, then, notwithstanding value judgments, the systematic analysis of mutant responses offers heuristic possibilities. Also, the norms of today become the vestiges of tomorrow. Studies have been cited which indicate that comparative and functional enterprises are symbiotic, not antithetical. The present system hypothesizes that understanding of individual differences is a necessary condition for the formulation of general laws of behavior.—*Author abstract*.

742. Weisman, Avery D. (Harvard Medical School, Boston, Mass.) **Misgivings and misconceptions in the psychiatric care of terminal patients.** *Psychiatry, Washington, D.C.*, 1970 (Feb), Vol. 33(1), 67-81.—Examines medical and specifically psychiatric attitudes toward death. Some common preconceptions about death are listed, and a case history where a 61-yr-old dying man was seen by the author is presented. (15 ref.)—*E. Uprichard*.

743. Wolkon, George H. (Case Western Reserve U.) **Ego strength, role-position salience and community tenure of the psychiatric patient.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 951-953.—Reanalysis of data from 178 psychiatric patients suggests role-position salience can predict community tenure but not the measures of ego strength.—*Journal abstract*.

PERSONNEL

744. Adler, Peter T. (Homestead Community Mental Health Center, Pittsburgh, Pa.) **Internship training for a contemporary profession of psychology.** *Professional*

Psychology, 1970 (Sum), Vol. 1(4), 371-376.—Describes an internship program in an impoverished neighborhood of a large metropolitan community. The needs of such a community population call for skills extending beyond the traditional range of psychodiagnostics and psychotherapy. A 10-wk basic techniques workshop begins the internship period. The intern then rotates through a variety of services including adult psychiatric in-patient service, emergency walk-in clinic, partial hospitalization unit, and child psychiatry service. A final unit is concerned with community education, organization, and resources. It is felt that these varied exposures better equip the professional psychologist to utilize his skills in order to cope with varied problems in an urban community.—*P. McMillan*.

745. Allon, Richard & Graham, John R. (Cleveland State U.) **Intercorrelations of factor scores from the Opinions About Mental Illness Scale.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 805-806.—Administered the Opinions About Mental Illness Scale (OMI) to 157 psychiatrists, residents, nurses, and aides from an urban, short-term psychiatric hospital. The 5 factor scores were intercorrelated. Correlations were higher among factors and, in some cases, in different direction, than previous studies have reported. Differences among occupational groups were found. Generalizing about relationships among OMI factors from 1 sample to another is cautioned against.—*Journal abstract*.

746. Austin, Elizabeth; McBride, Elizabeth J., Rodriguez, Miguel J., & Kaufman, Edward N. (U. Southern California, Medical Center) **Training program in rehabilitation medicine for career physicians in state mental hospitals.** *Rehabilitation Literature*, 1968 (Nov), Vol. 29(11), 332-334.—Developed a 3-yr program to expose physicians from state mental hospitals to physical medicine and rehabilitation. 15 doctors from 5 hospitals have participated in the program on a full- or parttime basis. A career residency was developed in physical medicine and rehabilitation. 3 of the trainees are now running the physical medicine departments of their hospitals. The other trainees have been able to develop cooperative efforts to augment and extend therapy in their own services given by nurses and other ward personnel and increase use of the physical medicine department therapy.—*Journal summary*.

747. Benedek, Therese. **Training analysis: Past, present and future.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 437-445.—Presents a historical review of training analysis from 1910 to the present with numerous references to the author's own experiences. Changing goals and techniques over the years are summarized. It is concluded that, the present need is to train psychoanalysts for their function as educators. (23 ref.)—*J. Chyatte*.

748. Berlin, Irving N. (U. Washington, Medical School) **Resistance to change in mental health professionals.** *American Journal of Orthopsychiatry*, 1969 (Jan), Vol. 39(1), 109-115.—Analyzes the fears of reduced status, financial return, work satisfaction, and feeling of competency that seem to be the cause of resistance to more responsive models of theory and practice by mental health professionals.—*Journal abstract*.

749. Blane, Stephen M. (Temple U., Counseling Center) **Immediate effect of supervisory experiences on counselor candidates.** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 39-44.—Measured

"empathic understanding before and after a particular supervisory experience (positive, negative, or no supervision)" of 3 10-person groups of counselors.—P. McMillan.

750. Blum, Donna M. & Vincent, M. O. (Carleton U., Ottawa, Canada). **Personality test characteristics of staff physicians and physicians as psychiatric patients.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 389-390.—Presents various test data on staff and patient physicians. The patients were more introverted and liable to neurotic breakdown under stress. The patients were differentiated from the staff on the K, D, Hy, and Pa scales of the MMPI with staff being more defensive and tending to deny worries, feelings of inferiority, and psychiatrically unhealthy symptoms. "Were it not for the greater defensiveness on the part of the staff, there might be no significant differences on the MMPI." The incidence of alcoholism and drug addiction was at least 50% in the patient group.—E. J. Kronenberger.

751. Carhuff, R. R. & Burstein, J. W. (American International Coll., Center for Human Relations & Community Affairs). **Objective therapist and client ratings of therapist-offered facilitative conditions of moderate to low functioning therapists.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 394-395.—12 experienced clinical psychologists and 12 inexperienced clinical trainees were cast as counselors with a standard, naive undergraduate student. Various ratings were made. "In general, the results indicate that among moderate to low functioning therapists, there are no positive relationships between objective ratings and either (a) client ratings, or (b) therapist self-ratings." It is suggested that only those persons who are themselves functioning at high levels can make accurate discriminations of levels of functioning.—E. J. Kronenberger.

752. Carter, Luther J. (American Assn. for the Advancement of Science, Washington, D.C.). **Topeka: Psychiatric aides shake up the old order.** *Science*, 1968 (Oct), Vol. 162(3849), 104-106.—Reviews the methods used by psychiatric aids in a state hospital to obtain fairer personnel practices regarding pay, status, and grievance procedures. It is felt that the union accomplished little other than the establishment of a grievance procedure. It is concluded that "the militancy of these workers, nearly ¾ of whom are Negroes, is simply a new manifestation of a pervasive national phenomenon" and that a strong union and an increased administrative willingness to negotiate are necessary.—G. Steele.

753. Chenault, Joann. (U. Massachusetts). **A proposed model for a humanistic counselor education program.** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 4-11.—Offers a working paper to be used as a frame of reference to develop counselor education programs with a humanistic orientation, specifically adapted to a doctoral program of training. A series of supporting propositions are presented.—P. McMillan.

754. Christian, P. & Haag, F. (U. Heidelberg, Inst. für sozial und Arbeitsmedizin, W. Germany). **Neuere Erfahrungen mit dem Case-Team-Work bei sog. "Problem-patienten."** [Recent experiences with case-team-work with so-called "problem patients."]. *Nervenarzt*, 1969 (Jul), Vol. 40(7), 314-317.—The case-team-work concept is an extension of the case-work concept. The team is comprised of 3 to 4 social workers, 2 physicians, and a psychoanalyst. The patient is a patient of internal

medicine—including patients with psychovegetative syndromes, psychosomatic conditions, marriage problems, etc. The method entails psychological and psychosocial ramifications of the clinical disease entity. Anxiety, regression, and personality changes occurring during physical diseases are discussed as well as how the case-team-work approach can aid the patient in motivating him toward recovery. (31 ref.)—B. A. Stanton.

755. Constantine, David D. (Pennsylvania State U.). **Counselor role and role conflict in a comprehensive rehabilitation center.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5063-5064.

756. Cowne, Leslie J. (Brooklyn Coll., City U. New York). **Case studies of volunteer programs in mental health.** *Mental Hygiene*, 1970 (Jul), Vol. 54(3), 337-346.—From the 200 located, 18 examples of mental health programs that utilize volunteers are presented. Funding, administrative set-up, and difficulties of each program are examined. The types of volunteer activities studied included community friend, mental health case aide, crisis intervention, juvenile court, serving retired persons, serving senior citizens in nursing homes, and social worker aide.—A. M. Cawley.

757. Davids, Anthony; Laffey, John J., & Cardin, Paul J. (Emma Pendleton Bradley Hosp., Riverside, R.I.). **Intellectual and personality factors in effective child care workers.** *American Journal of Orthopsychiatry*, 1969 (Jan), Vol. 39(1), 68-76.—Administered psychological tests to 34 child care workers in a residential treatment center; supervisors rated workers on personality traits and job performance. Correlations reveal some predicted and some unanticipated associations between IQ, supervisors' ratings, workers' self-ratings, and findings from projective tests.—*Journal abstract.*

758. Drage, Elaine & Lange, Blanche. **Ethical considerations in the use of patients for demonstration.** *American Journal of Nursing*, 1969 (Oct), Vol. 69(10), 2161-2165.—"Ethically... a nurse involved in the use of psychiatric patients for teaching purposes needs to be aware of the possible unmeasurable components which may disrupt the patients' recovery.... She must be prepared to assist patients to work through their reactions to a demonstration and to those aspects of themselves that they have exposed or that have been evoked in a demonstration."—B. A. Stanton.

759. Goldin, Paul. (U. Colorado, Medical Center). **Preparing mental health professionals as race relations consultants.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 343-350.—Describes "a training program whose goal was to provide relevant experiences to enable mental health professionals (psychiatrists, psychologists, and social workers) to assist school personnel in coping with personal and interpersonal problems related to race and ethnicity." The format and specific techniques for didactic sessions in workshops are reviewed. Recommendations include (a) developing self-awareness in regard to racial attitudes, (b) providing mechanisms for continuous feedback and follow-up, and (c) granting of more autonomy in program development to staff colleagues in the schools.—P. McMillan.

760. Hansen, James C. & Moore, Gilbert D. (State U. New York, Buffalo). **The full-time—part-time debate: A research contribution.** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 18-22.—Investigated differences in the quantity and quality of activities of 1st-yr counselors, identified by whether they were trained on a full- or part-time basis.—P. McMillan.

761. Havens, Robert I. (Wisconsin State U., Oshkosh) **Changes in counselor candidates response during the introductory practicum.** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 23-31.—Proposes "a new model of practicum experiences which would consider the best possible learning experiences for each counselor candidate."—P. McMillan.
762. Hurst, James C. & Jensen, Verne H. (Colorado State U., Counseling Center) **Personal growth: An ingredient in counselor education programs?** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 12-17.—Provides evidence that a direct attempt to establish a preparation procedure designed to bring about personal growth in terms of self- and other-awareness in counselor trainees was successful and that the personal growth was also passed on to the counselees seen by the trainees.—M. West.
763. Kelley, Jean A. (U. Alabama) **Leadership behaviors of the supervisor of nursing in general hospitals in Alabama as perceived by registered nurses and nursing students.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5113.
764. Kilburn, Kent L., McDole, Gary, & Smith, Ruth E. (Porterville State Hosp., Calif.) **The Strong Vocational Interest Blank as a measure of success in the training of psychiatric technicians.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 883-886.—To distinguish those psychiatric technician trainees who successfully complete their training from those who submit resignations in lieu of termination before completion of training, 3 measures of study skills and 2 personality inventories, SVIB & CPI, were administered at the beginning of training. Of the 54 scales on SVIB Form M, 12 including 7 of the 10 scales from the social service category, differentiated between Ss who remained and left ($p < .05$). Essentially negative results were obtained for the study skills measures, the CPI, and SVIB Form W.—*Journal abstract*.
765. Lee, Peter V. (U. Southern California, Medical School) **Some problems of curricular innovation: Reaction, response and renewal.** *Journal of the American Geriatrics Society*, 1969 (Mar), Vol. 17(3), 254-261.—Examines the factors involved in the present trend toward diversity in medical education: (a) increasing demand, (b) specialization, and (c) increasing mobility. 4 current issues are discussed: (a) period of education, (b) specialization, (c) individual variation, and (d) reality contacts. Major changes at 6 universities are presented. Methods of curricular, institutional, and organizational change are examined.—G. Steele.
766. Lefcourt, Herbert M. & Steffy, Richard A. (U. Waterloo, Ontario, Canada) **One man's adequacy is another man's failure.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 689-690.—Compared ratings of adequacy in the role of a student nurse by supervisors and students ($N = 23$) themselves with adequacy reflecting behaviors in laboratory tasks. Contrary to prediction it was found that adequacy in laboratory tasks was inversely related to nurse-role adequacy as judged by supervisors and students. Questions concerning the generality of such psychological constructs as adequacy are raised.—*Journal abstract*.
767. LeMay, Morris L. (Oregon State U.) **Counselor candidates' attitudes and opinions about mental illness.** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 51-54.—Presents a technique to examine attitudes and stimulate discussion of feelings about mental illness and mental health workers among counselors in training. The Opinions about Mental Illness scale, consisting of 51 Likert-type items and concerning the cause, description, and treatment of mental illness, was administered to 31 male and 50 female graduate students serving as Ss. Responses to the inventory revealed "a relatively enlightened set of attitudes toward mental illness."—P. McMillan.
768. Lesh, Terry V. (U. Oregon) **The relationship between Zen meditation and the development of accurate empathy.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4778-4779.
769. Linder, Ralph. (Montefiore Hosp. & Medical Center, Bronx, N.Y.) **A seminar in doctor-patient relationships in a rehabilitation medicine setting.** *Psychosomatics*, 1969 (Nov), Vol. 10(6), 354-359.—Discusses a seminar for residents in rehabilitation medicine which examines "problems encountered in the management of patients suffering from a variety of chronic diseases and/or disabilities." Methods of (a) improving interview skills, (b) avoiding viewing a "presenting problem exclusively from the perspective of their own specialty," and (c) determining the need for psychiatric referral were emphasized.—G. Steele.
770. Linton, Thomas E. (U. Wisconsin, Milwaukee) **The European Educateur Program for disturbed children.** *American Journal of Orthopsychiatry*, 1969 (Jan), Vol. 39(1), 125-133.—Innovative institutional programs for disturbed children have been extensively developed in France, Holland, England, and Denmark. These programs represent a basically different approach than is found in the United States. A key aspect of this work has been the development of a new professional role (educateur) and theoretical model for institutional work with maladjusted children. The educateur's role "is that of a highly trained child care worker who utilizes craft, vocational, and recreational activities to gain a close personal relationship with a group of from 10-12 handicapped children."—*Journal abstract*.
771. Meldman, M. J., McGowan, Marjorie; Schaller, Donna, & Higgans, Joan. (Forest Hosp., Des Plaines, Ill.) **Nurse psychotherapists in a private practice.** *American Journal of Nursing*, 1969 (Nov), Vol. 69(11), 2412-2415.—Psychiatric nurses were taught by a psychiatrist to do behavior therapy with obsessive-phobic patients, follow-up interviews with patients on drug therapy, and supportive therapy with various types of dependent patients. They are now part of a private practice which has increased to include patients who would otherwise have been referred to state psychiatric services.—*Journal abstract*.
772. Mussen, Michael. (U. Tennessee) **A limited application of verbal conditioning techniques to counselor preparation.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4835.
773. Poling, E. Gordon. (U. South Dakota) **Video tape recordings in counseling practicum: II. Critique considerations.** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 33-38.—Considers the most useful methods of utilizing the videotape medium in the program of counselor training. The impact of viewing one's own counseling behavior is stressed.—P. McMillan.
774. Rice, David G. & Fey, William F. (U. Wisconsin, Medical School) **Student satisfaction with small group teaching of psychiatry.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 174-179.—Adapted a previously constructed rating form to measure 1st- and

2nd-yr medical student satisfaction with small group teaching of psychiatry. 6 factors or instructor qualities showed differential contributions to student satisfaction: skill, overload, structure, feedback, interaction, and rapport. Use of 3 separate samples of students (total $N = 245$) indicated that the rating form had a highly significant degree of stability over time and across courses. A feedback profile to each instructor indicated how he was perceived by his students on the different teaching factors and how he compared with other instructors in the same course.—*Journal summary.*

775. **Rodrigue, Emilio.** The fifty thousand hour patient. *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 603-613.—In 25 yr., the author estimates that he has heard 50,000 hr. of patients. Patients generally are compassionate of the analyst himself, gain insight outside of the analysis sessions, and experience a special relationship with the analyst they find. Analysis has grown old and inhibited. Its procedures, aims, and theory are those of an old man. Training analysis prevents anyone under 40 from practicing. Procedure has crystalized so much that the analyst can be characterized as "yes, but," silent or static individuals who repeat magic incantations as "guilt," "insight." He is not the curer of patients; he merely transforms the patient into a person better adapted to his society, not a well, fully capable individual. (22 ref.)—*J. Chvatte.*

776. **Ruffin, William C. & McGinnis, Nancy H.** (U. Florida, Medical School) **Psychiatry for all doctors: Postgraduate education.** *Psychosomatics*, 1969 (Nov), Vol. 10(6), 329-333.—Describes the historical background, course content, characteristics of the physicians enrolled, results, conclusions and plans for future research of postgraduate courses for the teaching of psychiatry to nonpsychiatric physicians. These courses are continually changing and developing in the light of new knowledge of the needs of the student-physicians and evaluation of the results.—*Journal summary.*

777. **Salk, Lee.** (Cornell U., Medical School) **Psychologist in a pediatric setting.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 395-396.—Describes the purposes and functions of a psychologist in a pediatric setting. Possible contributions include (a) prompt screening, (b) early diagnosis of learning and developmental problems, (c) current behavioral knowledge transmission to the pediatric staff, (d) guidance of child-rearing practices toward greater emotional strength, and (e) sensitization of pediatric staff to emotional needs of children to lessen the "traumatic nature of medical procedures and hospitalization."

778. **Saul, Ezra V. & Kass, Joan S.** (Tufts U., Medical School, Boston, Mass.) **Study of anticipated anxiety in a medical school setting.** *Journal of Medical Education*, 1969 (Jun), Vol. 44(6), 526-532.—Adapted the S-R Inventory of Anxiousness so that 1st-yr medical students responded to 15 situations likely to be encountered during the 4 yr. of medical school. 121 Ss completed the Inventory on the 1st day of school (subtest) and 95 of these completed it again at the end of the 1st yr. (posttest). Results show that: (a) Ss evidence substantial differences in degree of anticipated anxiety aroused by specific situations; (b) situations dealing with death arouse the most anxiety, and those implying academic failure are next in order; (c) situations having to do with mastery of clinical skills arouse the least anxiety; (d) females exhibit more anxiety than males in all situations

except examining female patients and participating in an experiment; and (e) posttest data indicate that the rank order of the 15 situations remained the same, while there were substantial increases in situational anxiety and in total anxiety over the entire Inventory. It is concluded that the S-R Inventory of Anxiousness does have utility as a method for permitting students to reflect their anticipation of anxiety in a variety of situations. Implications of results and further uses of the Inventory for improving and redesigning medical education programs are discussed.—*M. Maney.*

779. **Shah, Chandrakant P., Robinson, Geoffrey C., & Kinnis, Claire.** (U. British Columbia, Vancouver, Canada) **An ambulatory pediatric teaching program for final-year medical students: Report of a study of student attitudes.** *Canadian Medical Association Journal*, 1969 (Apr), Vol. 100(13), 615-619.—Presents an appraisal of an outpatient pediatric teaching program. Questionnaires were returned by 54 students. Ss felt the program to be beneficial in learning to deal with everyday problems and in understanding the team approach. Ratings of supervisors' teaching attributes revealed that knowledge of subject needs to be combined with good personality traits. Modifications resulting from the study are presented. (25 ref.)—*G. Steele.*

780. **Shapiro, David S.** (Harvard U., School of Public Health) **Mental health professionals' hang-ups in training mental health counselors.** *Mental Hygiene*, 1970 (Jul), Vol. 54(3), 364-369.—In the course of training more than 1000 physicians, ministers, public health nurses, welfare case workers, rehabilitation counselors, guidance counselors and others, many misconceptions held by the mental health professional were revealed. Some of the myths are that: (a) they are the primary source of help for, and exclusive caretakers of, the emotionally and mentally ill; (b) that competent psychiatric services are the optimal form of help for all forms of mental and emotional problems; (c) that other professionals are essentially amateurs in this field; (d) that mental health training for the nonpsychiatric professions should be similar in design, objectives, and content to the training of mental health professionals; and (e) that training skills and ideas presented in a short workshop or training program will automatically carry over into practice. Collaboration is essential among all the groups involved.—*A. M. Cawley.*

781. **Thompson, Andrew.** (U. Oregon, Counseling Center) **The Fairweather group program: Implications for counselor preparation and practice.** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 55-60.—Describes the rationale, advantages, and disadvantages of the application of a program (originally involving mental hospital patients organized into problem solving groups) to the training of counselors in practicum settings.—*P. McMillan.*

782. **Ulmer, R. A. & Kupperman, S. C.** (State Hosp., Camarillo, Calif.) **An empirical study of the process and outcome of psychiatric consultation.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 323-326.—An analysis was made of the psychiatric consultant involved in 15 clients over 3 yr. in 71 individual sessions. It is concluded that the consultation was of no discernible value in improving professional functioning of counselors or helping the clients.—*E. J. Kronenberger.*

783. **Williams, Elliot W.** (Jacksonville State Hosp., Ill.) **From psychiatric aide to psychologist** *Mental Hygiene*, 1970 (Jul), Vol. 54(3), 430-432.—The process,

problems, and rewards of changing roles from a career aide supervisor to a professional clinical psychologist are presented autobiographically.—A. M. Cawley.

784. Zabarenko, Ralph N., Zabarenko, Lucy, & Pittenger, Rex A. (U. Pittsburgh, Medical School) **The psychodynamics of physicianhood.** *Psychiatry, Washington, D.C.*, 1970 (Feb), Vol. 33(1), 102-118.—Reviews literature on the position of the physician including the doctor game, reasons for medical practice, and major myths involved in medicine. Cases are presented from a larger study in which physicians were observed at their work. An attempt is made to explore the psychodynamics of the choice of medicine as a career and the way in which the physicians' practices nurture basic and often neurotic needs. (18 ref.)—E. Upprichard.

785. Zumalt, Lonnie E. (U. Alabama) **Application of an identification model to the study of attitude change among counseling practicum participants.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4787.

PSYCHOTHERAPY & ANALYSIS

786. Bak, Robert G. **Recent developments in psychoanalysis: A critical summary of the main theme of the 26th International Psycho-Analytical Congress in Rome.** *International Journal of Psycho-Analysis*, 1970 (Apr), Vol. 51(2), 255-264.—2 points are obvious from the papers given at the Congress: little fact gathering characterizes psychoanalysis at present and there is an absence of new clinical findings in the papers but attempts are made to integrate phenomenological approaches with psychoanalysis. 7 papers are summarized. It is concluded that there is a widening gap between theory and clinical facts and a plea is made that the next Congress have more data and less theory.—J. Chyatte.

787. Beres, David & Joseph, Edward D. (151 Central Park W., New York, N.Y.) **The concept of mental representation in psychoanalysis.** *International Journal of Psycho-Analysis*, 1970 (Jan), Vol. 51(1), 1-9.—Examines the human capacity to evoke in consciousness representation of an absent object and the relationship of consciousness and unconsciousness as qualities of psychic functioning. Assumed is an unconscious psychic organization, the mental representation, whose nature is not known, but which is available for transformation to a conscious symbol, image, fantasy, thought, affect, or action. This transformation can take place without an external stimulus. Only in man can a thought evoke another thought; only in man can an unconscious element evoke a conscious response. The difference between memory and mental representation, and between mental registration and mental representation is elucidated. Internalization and its relation to incorporation, introjection, and identification is discussed. The concept of mental representation heuristic value in its application to the concepts of the structural theory, to the economic problems of metapsychology, and to many clinical problems. It clarifies concepts of mental processes to state that these occur between mental representations. (35 ref.)—*Journal summary*.

788. Bhadra, M. K. **Existential psycho-analysis: Its various aspects.** *Samiksha*, 1967, Vol. 21(4), 139-157.—Studied the ideas of Kierkegaard, Heidegger, and Sartre to show how it is possible to use these ideas in actual psychiatric practice. (54 ref.)

789. Brierley, Marjorie. **"Hardy perennials" and psychoanalysis.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 447-452.—Psychoanalysis has inadequate scientific status and must rely on individual clinical findings, direct observation, and perhaps an occasional longitudinal survey. Hypotheses should be open to revision as knowledge is accumulated. Personal bias should not prevent the acceptance of new or discordant ideas. Patients need not fit the theory; the theory must fit the patient. Reconciliation of divergent theories is hampered by the invention of new terminology as each new school forms. (22 ref.)—J. Chyatte.

790. Bychowski, Gustav. **Social climate and resistance in psychoanalysis.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 453-459.—Individual resistance finds powerful support in the social climate and sometimes psychoanalytic techniques are ineffective. It is impossible to analyze an individual living in a period of powerful traditional beliefs and prejudices, e.g., religious wars, political fanatics, etc. If individual regression is supported by group values it is questionable if the regression can be reversed. In analysis emphasis should be put on the importance of values generally to counteract the individual's regression and role in the cultural disintegration. The analyst must be interested in problems of culture and in elevating his Ss to the highest level of functioning in that culture. Psychoanalysis is ineffectual in changing group resistance and cannot be used to modify social issues. The social climate must be changed in other ways, e.g., mass communication, mass education, etc., to initiate changes without destructive violence.—J. Chyatte.

791. Carlson, Peter M. (U. Washington) **An analysis of the motor, cognitive and physiological components of psychotherapeutically induced changes in phobic behavior.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5233-5234.

792. Chassin, J. B. (George Washington U., Medical School) **On psychodynamics and clinical research methodology.** *Psychiatry, Washington, D.C.*, 1970 (Feb), Vol. 33(1), 94-101.—Criticizes lack of consideration of the question of process in clinical treatment. Rating scales are often misused and statistics misinterpreted, but beyond that questions of process influence the validity of even the most accurate statistics. For example, hostility might be rated as a negative clinical sign yet the evidence of hostility in a previously withdrawn passive patient might be a positive indication of improvement. Process is juxtaposed with outcome, and more in-depth study of the therapy as process irrespective of outcome is suggested.—E. Upprichard.

793. Dahlberg, Charles C. (516 E. 87th St., New York, N.Y.) **Sexual contact between patient and therapist.** *Contemporary Psychoanalysis*, 1970 (Spr), Vol. 6(2), 107-124.—On the basis of 1st-hand information from either the patient or the therapist involved, 9 cases are presented and discussed in terms of the consequences for patient and therapist. All therapists were men over 40 and the patients with 1 exception were women from 10-25 yr. younger than their therapists. Some speculations as to the therapists' motivations and dynamics are offered. General counterindications against such sexual involvements are presented.—L. W. Brandt.

794. Dengrove, Edward; Nuland, William, & Wright, M. Erik. (541 N. Edgemere Dr., W. Allenhurst, N.J.) **A single-treatment method to stop smoking using ancillary self-hypnosis: Discussions.** *International*

Journal of Clinical & Experimental Hypnosis, 1970 (Oct), Vol. 18(4), 251-267.—Discusses H. Spiegel's (see PA, Vol. 45: Issue 1) smoking treatment method comparing it to behavior therapy and suggesting modifications to treat smokers not responding to the method as described. It is suggested that certain psychological conditions must become active for nonsmoking status to be achieved or maintained including: (a) recognizing the consequences of smoking to be imminent, (b) identifying oneself as a nonsmoker, (c) expecting and wanting to participate in a satisfying future, and (d) adopting a way by which the individual can gain control over smoking. The technique outlined deals with these 4 dynamic aspects and makes a significant contribution to the treatment of the smoker's problem. (German & Spanish summaries)—*Journal abstract*.

795. Eissler, K. R. Irreverent remarks about the present and the future of psychoanalysis. *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 461-471.—Discusses psychoanalysis as a method, a therapy, and a science. Its method is not in dispute, just its value as therapy and status as a science. Both significant psychoanalytic research and the number of training analysts are declining indicating a loosening of educational standards with a concomitant pessimistic outlook for the future of analysis. Dehumanization in science is evident. This may lead to a more disdainful attitude toward analysis. The author does not see a revulsion toward science with a subsequent return to religion and superstition, but an era of social engineers who protect humans.—*J. Chyatte*.

796. Fairweather, George W., Sanders, David H., Maynard, Hugo, & Cressler, David L. (Michigan State U.) *Community life for the mentally ill: An alternative to institutional care*. Chicago, Ill.: Aldine, 1969. x, 357 p. \$10.

797. Faltico, Gary J. (U. California, Los Angeles) *The vocabulary of nonverbal communication in the psychological interview*. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5236-5237.

798. Freud, Anna. Dr. Herman Nunberg: An appreciation. *International Journal of Psycho-Analysis*, 1969 (Apr.), Vol. 50(2), 135-138.—This appreciation commemorated the 85th birthday of Herman Nunberg who is noted for his proposal that no one be admitted as a member of the International Psychoanalytic Congress until he underwent personal training analysis. Nunberg places his 1930 work, "Synthetic Function of the Ego," 2nd only to Freud in dealing with ego psychology. Therapy should free the synthetic function from interference by pathology so it can resume normal functioning. Nunberg carefully uses clinical observation to substantiate theoretical viewpoints. Nunberg's ability to differentiate fact from opinion is commended.—*J. Chyatte*.

799. Freud, Anna. Indications and contraindications for child analysis. *Psychoanalytic Study of the Child*, 1968, Vol. 23, 37-46.—Discusses the use of analysis in the treatment of children with childhood neuroses, environmental interferences, developmental frustrations, and physical disabilities such as blindness.—*B. A. Stanton*.

800. Greenson, Ralph R. The origin and fate of new ideas in psychoanalysis. *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 503-515.—There is a lack of creativity, originality, and new ideas among present-day analysts. Out of frustration and discontent

come new ideas and methods. "Creativity is not the antithesis of conservation." When a new idea is conceived it gains more significance than it merits and becomes the center of the creator's life. An idea is like a baby who should grow, mature, and learn from others besides its parent and may eventually become a member of another family of ideas. Followers of schools view each new idea as a dangerous and evident threat which may destroy their professional identity. They value their leader's idea out of proportion to their merit and this leads to dogma and bigotry. There is a lack of free and open discussion thus stifling creativity. There is inbreeding in schools verging on the edge of incest. An exchange of ideas is needed among and within schools. The task is not to defend or attack Freud but to increase knowledge. (60 ref.)—*J. Chyatte*.

801. Greenwald, Harold. (Metropolitan Inst. for Psychoanalysis, New York, N.Y.) *Depression as an interpersonal maneuver*. *Journal of Contemporary Psychotherapy*, 1970 (Win), Vol. 2(2), 110-116.—Suggests that the phenomenon of depression, seen as an interpersonal maneuver, can be viewed in terms of learning theory terms, i.e., the depressed person has learned that being depressed assures attaining approval, and that depressive behavior can be used as a means of punishing other people for the hostility they have toward him. The treatment methods described emphasize flexibility and changing the pattern of behavior so that the patient ceases to interact in a depressive way in the therapy session, and then can eventually generalize this new behavior to life outside. It is stressed that the therapist must be vigilant against rewarding the depression; 2 specific methods which have proved successful in accomplishing this are discussed, and illustrative cases are presented.—*M. Maney*.

802. Grinberg, Leon. New ideas: Conflict and evolution. *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 517-528.—Einstein, Marx, and Freud have made tremendous contributions to current ideas. Conflicts between conservatives and innovators have historically not only been due to ideological differences but also to the emotions of the participants. Progress can be achieved if there is an agreement as to terminology and meanings, less strict adherence to traditional theories, reduction in the number of theories, encouragement of research, and an open exchange of ideas. Psychoanalysis should apply some of its "insights" to current social problems where possible in order to prevent disaster and destruction. It is suggested that investigation teams of analysts devoted specifically to research be organized. (56 ref.)—*J. Chyatte*.

803. Halpern, Florence. (Tufts-Delta Health Center, Mound Bayou, Miss.) *Psychotherapy in the rural South*. *Journal of Contemporary Psychotherapy*, 1970 (Win), Vol. 2(2), 67-74.—Examines how the experiences of rural Southern blacks in being forced to accept a pattern of existence dictated by the expectations of the white community have led to a perception of reality completely different from that of the white community and to behavioral patterns characterized by denied and repressed ideas, feelings, needs, and efforts at self-realization. It is stressed that in any constructive therapeutic effort with these people, these differences must be recognized and responded to appropriately. Several cases are examined to demonstrate how inappropriate traditional psychotherapeutic methods are in dealing with these people, and to suggest that there are

possible constructive approaches to daily crises which can help rural black patients direct their energy and anger in productive ways.—*M. Maney.*

804. **Harris, Martha.** *The child psychotherapist and the patient's family.* *Journal of Child Psychotherapy*, 1968 (Dec), Vol. 2(2), 50-63.—Discusses the interview with parents preparatory to beginning the child's treatment and suggests several reasons for wariness in giving advice. Also discussed are reasons why parents are seen very little by the child's therapist once treatment is begun. Cases illustrate how the psychoanalytic technique enables the child gradually to transfer anxieties to the therapist in a way that does not interfere with his dependence on his parents. A consultation with parents and their 14-mo-old boy is described. The therapist gave only tentative advice designed to strengthen the parents' own perceptions of the child's head-banging problem.—*A. Alvarez.*

805. **Heuscher, Julius S.** *Encounter—world design—insight: A holistic view of psychotherapy.* *Journal of Contemporary Psychotherapy*, 1970 (Win) (Vol. 2(2)), 93-102.—Demonstrates that all effective psychotherapy has existential dimensions, but that there is justification for the limited use of the expression "existential psychotherapy." The fundamental verities of existential psychotherapy are summarized, focusing on "the relationship between structure (or world-design), insight, and encounter as reflected by a phenomenological view of Behavior Therapy, Psycho-analysis, and 'Existential Psychotherapy' . . ." It is concluded that, while existentialism stresses "contingency as well as the meaningless void confronting or underlying many human illusions . . ." it has also opened up "wide, unsuspected horizons towards further human growth." (19 ref.)—*M. Maney.*

806. **Lampl-de Groot, Jeanne.** *Reflections on the development of psychoanalysis: Technical implications in analytic treatment.* *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 567-572.—Presents general remarks on the development of theory considering changes in the last 20 yr., i.e., changes in different countries, the increase in mental disorders treated, and extension of ego psychology, an application of psychoanalytic theory to psychiatry, and psychology. Technical implications cover character analysis of training candidates, and a hope that constructive activities in mankind will outweigh destructive ones eventually.—*J. Chyatte.*

807. **Lorand, Sandor.** *Reflections on the development of psychoanalysis in New York from 1925.* *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 589-595.

808. **MacKinnon, Roger A.** (Columbia U., Coll. of Physicians & Surgeons) *The role of the telephone in the psychiatric interview.* *Psychiatry, Washington, D.C.*, 1970 (Feb), Vol. 33(1), 82-93.—Considers the initial telephone call as well as subsequent phone calls including the question of the psychiatrist's home phone number being given out. Telephone interruptions during therapy and different types of patient reaction and the psychiatrist's reaction are discussed. Emergency calls and conducting regular therapy sessions by telephone are considered.—*E. Uprichard.*

809. **Mathieu, M.** (5 Ave. de la Porte de Sèvres, Paris, France) *Les psychothérapies du jeune adulte appelé au service militaire: Essai de conceptualisation.* [Psychotherapies for the young adult called to military

service: A conceptual essay.] *Hygiène Mentale*, 1970 (Jan), Vol. 59(1), 1-30.—Discusses therapeutic problems in the treatment of postadolescent males in military service. Incomplete integration of preceding development allows resurgence of unresolved conflicts, and prolongation of oedipal conflicts. Therapy must embrace adjustment to the demands of the milieu and resolution of inner conflicts. Some cases require support for defenses needed in adapting to the military life and others require a weakening of defenses. (20 ref.)—*W. W. Meissner.*

810. **Mitscherlich, Alexander, et al.** (Sigmund Freud Inst., Frankfurt, W. Germany) *On psychoanalysis and sociology.* *International Journal of Psycho-Analysis*, 1970 (Jan), Vol. 51(1), 33-48.—Psychological insights gained through observing individuals should be augmented with data obtained through group observation (sociology). Intradiscipline research which is mutually beneficial must be encouraged. Freud noted that we must use group psychology, i.e., family group, to understand the individual. He transformed individual into social psychology through his theory of object relations. Hartmann granted sociology its independence but wanted all behavior assessed by psychoanalysis. The term "dynamic" in psychoanalysis presents an obstacle to collaboration. Parsons places the collective rationality above the individual rationality as the individual internalizes the moral sense of the community. The city is the new collectivity and influences the social traits of the individual. Unconscious perceptual processes may promote social cohesiveness in city dwellers or an aloofness and selectivity in contacts. (85 ref.)—*J. Chyatte.*

811. **Myerson, Paul G.** *The hysteric's experience in psychoanalysis.* *International Journal of Psycho-Analysis*, 1969 (Jul), Vol. 50(3), 373-384.—The hysterical modes of functioning are more fundamental for delineating the hysterical syndrome than hysterical traits or symptoms. Emphasis is placed on how the hysteric functions when he is coping in a relatively adequate fashion than upon how he reacts under great stress. The hysteric is characteristically preoccupied with symbolic phallic interests even as he carries on ordinary conversations. The hysteric's behavior reveals his tendency, when under instinctual tension, to anticipate that someone will be helpful or can be maneuvered into being helpful in relieving tension. Hysterics accept the limits set on direct instinctual gratification if the analyst accepts substitute forms of gratification indigenous to the analytic situation. If this bargain is negated, the hysteric reacts regressively or progressively.—*J. Chyatte.*

812. **Nacht, S.** *Reflections on the evolution of psychoanalytic knowledge.* *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 597.

813. **Nagera, Humberto.** *The concept of ego apparatus in psychoanalysis: Including considerations concerning the somatic roots of the ego.* *Psychoanalytic Study of the Child*, 1968, Vol. 23, 224-242.—Defines ego apparatus as "an intangible, nonmaterial organization, with a functional structure of its own, which regulates its own activities and those of the multiple somatic structures or organs it utilizes . . ." The integration of functional capacities (from somatic maturational processes) into the ego apparatus is discussed. (16 ref.)—*B. A. Stanton.*

814. **Pressman, Maurie D.** *The cognitive function of the ego in psychoanalysis.* *International Journal of*

Psycho-Analysis, 1969 (Jul), Vol. 50(3), 343-351.—"Incognizance" is used for those partial decathexes of mental content which are not true repressions but are partial repressions. Insight formation results from reversing the motivating force for repression, i.e., help the patient tolerate the formerly intolerable and thus more fully cathecting that which has been cathected. Insight is gained through amalgamating in consciousness idea, affect, motor impulse, and self-image. Exaggerating or diminishing any of these 4 results in abortion of insight, as in intellectualization, affectualization, acting-in, and acting-out. Patients resort to neurotic defensive maneuvers because they work. These may be a nutriment for the neurosis (an exchange with the environment which maintains the neurosis). Recognition of this provides further understanding of the need for analytic neutrality. One must starve the neurosis before it can be objectified for the patient.—J. Chyatte.

815. Ritvo, Samuel. Panel on "Child analysis." *International Journal of Psycho-Analysis*, 1970 (Apr), Vol. 51(2), 233-235.—Direct observation in childhood is needed to increase our understanding of child development and later adult analysis. Definition as to what constitutes observation is unclear at present. Some panelists agree on the value of observations while others view it as a danger and contaminant leading to inappropriate theoretical propositions. "Information gathering from outside the analytic situation may mislead the analyst and lead him to modify his technique." Clinical examples indicate that direct observations do help some analysts.—J. Chyatte.

816. Rosen, Victor H. Panel on "Language and psychoanalysis." *International Journal of Psycho-Analysis*, 1970 (Apr), Vol. 51(2), 237-243.—Parallels exist between linguistics and psychoanalysis: both depend on the past and are related to thought. Panelists theorize that language is related to superego development, intrapsychic processes, defense mechanisms, communication, emotional expression, symbols, behavior (e.g., silence), socioeconomic status, etc. Language expresses emotion in itself and in the social context in which it occurs. The panel concluded that what is known about language cannot be integrated with what is presently known about people.—J. Chyatte.

817. Rosenbluth, Dina. "Insight" as an aim of treatment. *Journal of Child Psychotherapy*, 1968 (Dec), Vol. 2(2), 5-17.—Discusses some of the problems involved in thinking about "aims" of treatment, and about "mental health." Since in psychoanalytic therapy one attempts to understand the child and convey this understanding to him, some aspects of the concept of "insight" are considered. It is concluded that one hopes to achieve not so much insight as a possession, once and for all, but rather a shift in the attitude of mind; this involves a diminished need to project feelings and anxieties, and results from an identification with and internalization of an insightful or insight-seeking therapist, thus increasing the child's future capacity for "insight."—Author abstract.

818. Rosenfeld, Herbert. On the treatment of psychotic states by psychoanalysis: An historical approach. *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 615-629.—Freud was pessimistic about the analysis of psychotics believing they did not form transference. Now there are those who believe that the narcissism of the psychotic presents a complete obstacle to analysis unless the analyst changes his usual analytic

attitude. Others attempt to deal with the narcissism and other psychotic manifestations by the classical analytic approach with only minor changes. The development of psychotic's treatment over the last 1/2 century suggests that perhaps Freud's hope that some treatment of psychotics was possible may be justified. (46 ref.)—J. Chyatte.

819. Sinha, T. C. Ego-oriented psycho-analytic therapy. *Samiksa*, 1967, Vol. 21(4), 158-168.—Discusses a new dynamic concept of the ego and its relationship to a more positive outlook in psychoanalysis. Within this concept, the ego is viewed as a creator in every sense, both in mental pathology and mental health within its own limitations. Thus, psychoanalysis becomes a therapeutic reeducation of the ego with a view to freeing it so that it can better utilize its creative powers.

820. Spiegel, Herbert. (Columbia U.) A single-treatment method to stop smoking using ancillary self-hypnosis. *International Journal of Clinical & Experimental Hypnosis*, 1970 (Oct), Vol. 18(4), 235-250.—Discusses the 1st 615 patient-smokers who were treated with a single 45-min session of psychotherapy reinforced by hypnosis. Technique of treatment, including rationale of approach, induction procedure, assessment of hypnotizability, and training instructions to stop smoking are presented in detail. 6-mo follow-up study results are discussed. Of 44% who returned a questionnaire, hard-core smokers stopped for at least 6 mo. Another 20% reduced their smoking to varying degrees. Results of a 1-session treatment compare favorably with, and often are significantly better than, other longer-term methods reported in the literature. It is suggested that every habitual smoker who is motivated to stop be exposed to the impact of this procedure, or its equivalent, so that at least 1 of 5 smokers can be salvaged. (French & Spanish summaries)

821. Spiegel, Herbert. (Columbia U.) A single-treatment method to stop smoking using ancillary self-hypnosis: Final remarks in response to the discussants. *International Journal of Clinical & Experimental Hypnosis*, 1970 (Oct), Vol. 18(4), 268-269.—Reexamines the major points of the author's papers (see PA, Vol. 45:Issue 1) on smoking modification. Data inclusion, therapy length, Ss' ability to change, and use of multiple therapists and tape recordings as reinforcement are discussed. It is concluded that the method should be used to "sharpen our techniques that we can relatively quickly learn who has the capacity to change for given goals, and then to help evoke the desired change as efficiently as possible."—G. Steele.

822. Sprince, Marjorie P. Work with adolescents: Brief psychotherapy with a limited aim. *Journal of Child Psychotherapy*, 1968 (Dec), Vol. 2(2), 31-37.—The paper is the outcome of experience in an experimental "Walk-in-Centre" for 14-22 yr. olds. The approach was influenced by understanding gained from intensive psychoanalytic work with adolescents and by the assumption that adolescents who feel compelled to seek help should get it at once. Problems of case selection and of technique at 3 developmental stages of adolescence are discussed. 3 cases illustrate the need for distinguishing between individuals whose problems have to do with transitory adolescent hold-up of the developmental processes and individuals whose encounter with adolescence revives unresolved conflicts of a much earlier stage.—A. Alvarez.

823. Sutherland, John D. Psychoanalysis in the

post-industrial society. *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 673-682.—Post-industrial society results from increased technological production and decreased human participation in this production. Patients bring new problems with this change, e.g., lack of zest, dissatisfaction, unhappiness. Dissemination of information brings hordes of people in stress in for treatment. Other disciplines have to shoulder some of the load. Change brings anxiety. Psychoanalysis can no longer limit itself to the individual and the affluent one at that. It must study the current scene and act constructively.—J. Chyatte.

824. Thoma, Helmut. Some remarks on psychoanalysis in Germany: Past and present. *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 683-691.—Covers certain changes in German psychoanalysis from 1933 to the present. Topics include the liquidation of psychoanalysis between 1933-1945, the struggle to regain identity from 1945 to now, and developments and expansions in some areas. Psychoanalysis is now recognized as medical treatment and paid for by the social insurance agencies. Freud's 1919 prediction is fully accomplished. Treatment without fee leads to forcing medical associations and universities to train personnel, and they can no longer ignore psychoanalysis. Students participate more in their training than previously.—J. Chyatte.

825. Wallerstein, Robert S. Panel on "Psychoanalysis and psychotherapy." *International Journal of Psycho-Analysis*, 1970 (Apr), Vol. 51(2), 219-231.—Psychoanalysts work in many settings and need to adjust their therapy accordingly. In order to alleviate the glut of patients in hospitals other professionals must be trained in therapy methods. Psychotherapists must precisely formulate their theories and clearly define terms before such training can proceed. Psychoanalysis and psychotherapy differ in the patients treated, aims, goals, methods, techniques, and processes. These differences appear to be important to practitioners.—J. Chyatte.

Therapeutic Process

826. Calnek, Maynard. (Pleasantville Cottage School, N.Y.) **Racial factors in the countertransference: The black therapist and the black client.** *American Journal of Orthopsychiatry*, 1970 (Jan), Vol. 40(1), 39-46.—The black therapist-black client therapeutic situation is threatened by difficulties because of the traditional American racial climate, with white racial prejudice considered the frequent source of these problems. Analysis of 4 common problems are presented: (a) denial of identification, (b) overidentification as defined as a felt bond with another black person who is seen as an extension of oneself because of a common racial experience, (c) self-image, and (d) class differences and similarities between therapist and client. It is concluded that a major prerequisite for the black psychotherapist working with a black client is the thorough examination of one's own feelings on being black and one's way of coping with his own anger. (20 ref.)—A. M. Berg.

827. Gumbel, Erich. Discussion of "The non-transference relationship in the psychoanalytic situation." *International Journal of Psycho-Analysis*, 1970 (Apr), Vol. 51(2), 143-150.—Not all interactions between patient and psychoanalyst are transference reactions. Interventions beside interpretation are necessary in psychoanalysis and must be actively nurtured. Trans-

ference reactions are unreliable; the real object relationship is important where the analyst sees the whole person and does more than focus on his neurosis for "insight" through interpreting patient verbalizations. Author experience indicates that psychoanalysis is possible only when both a transference and non-transference ("real") relationship exists. Criticisms are raised and clarification is attempted.—J. Chyatte.

828. Lax, Ruth F. Some considerations about transference and countertransference manifestations evoked by the analyst's pregnancy. *International Journal of Psycho-Analysis*, 1969 (Jul), Vol. 50(3), 363-372.—No data exist as to what happens when the analyst gets pregnant. Pregnancy should be considered in terms of its effect on the analyst. She may become more sensitive to the onslaught of conflict manifestations in patients. She may be more vulnerable to different transference reactions and may have to adjust to increased countertransference reactions. A personal event in the analyst's life (baby) intrudes on the neutrality needed in the analytic situation. 6 cases are summarized. "Specific reality situations may interfere with the sequence of the transference neurosis but need not necessarily interfere with the unfolding of a pattern of infantile conflicts characteristic for a given patient."—J. Chyatte.

829. Loewenstein, Rudolph M. Developments in the theory of transference in the last fifty years. *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 583-588.—Summarizes various changes in the concept of transference. Recent trends indicate a widening of the concept of transference to situations outside of analysis. There is an attempt at separating transference from that of a treatment alliance and from the "real" relationship between analyst S. Confusion has occurred between definition and usage especially in 1 aspect of transference, acting-out. (35 ref.)—J. Chyatte.

830. Papanek, Helene. (1 W. 64th St., New York, N.Y.) **Group psychotherapy interminable.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 219-223.—The patient, the setting, the composition and atmosphere of the group, and the therapist are factors which influence the duration of therapy. It is contended that: "When the group caters to the patient's dependency needs and fails to encourage growth, self-acceptance, and social interaction, the result is a custodial, not a therapeutic group. Only when the patient is helped to develop a positive self-image and encouraged to find satisfaction in interpersonal relationships and work achievement can the pitfall of interminable group psychotherapy be avoided."—I. Linnick.

831. Pressman, Maurice D. The cognitive function of the ego in psychoanalysis: The search for insight. *International Journal of Psycho-Analysis*, 1969 (Apr), Vol. 50(2), 187-196.—An attempt is made to understand the cognitive functioning of the ego in the psychoanalytic situation to allow fuller comprehension of insight and why some patients succeed and some fail. Cognitive function is the perceiving part of the ego that works on the patient's inner world during analysis. It is an inner search. It is revealed in the patient's style and is a base line which is returned to in order to determine the patient's resistance. Several "rules" are advanced: (a) have the patient free associate, and (b) have the patient reflect on it to better understand himself and his problems. Cognition is also achieved when the analyst identification exists and attempts are made to work

through to insight. Cognitive function (insight) is achieved through analyst's silence, his use of the transference situation, the frustration or encouragement of the impulse to action, paying attention to the present mature ego, gaining distance from memories, pertinent questioning, interpretation of resistance to patient, etc. (43 ref.)—*J. Chyatte.*

832. Sandler, J., Dare, C., & Holder, A. (Inst. of Psychiatry, London, England) **Basic psychoanalytic concepts: I. The extension of clinical concepts outside the psychoanalytic situation.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 551-554.—Beyond asking questions the analysts' major therapeutic interventions consist of interpretations, confrontations, and reconstructions, concepts which are to be dealt with in subsequent papers. Resistance, transference, therapeutic alliance, acting-out, working through, and negative therapeutic reaction are also seen as key concepts which have a multiplicity and ambiguity of meaning in the clinical setting. Discussion of these concepts will permit exploration of the degree to which they can be applied to a context wider than the consulting room. (24 ref.)—*R. L. Sulzer.*

833. Sandler, J., Holder, A., & Dare, C. (Inst. of Psychiatry, London, England) **Basic psychoanalytic concepts: II. The treatment alliance.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 555-558.—The concept of the treatment alliance appears to be capable of extension outside psychoanalysis without modification. The alliance seems essential to the success of a prolonged course of rehabilitation and can be extended to include the capacities of the patient's family or other agencies. (25 ref.)—*R. L. Sulzer.*

834. Sandler, Joseph, et al. **Notes on some theoretical and clinical aspects of transference.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 633-645.—Transference is a clinical not a metapsychological concept. The special analytical situation may facilitate emergence of certain relationships especially past ones, but not all are repetitions of past relationships to objects. Transference is more than its original narrow conception. Distinction between repetition of past relationships to objects, defenses against this, various forms of externalization, the displacements and extensions of other current relationships, and "character" transferences must be made by the analyst. Work with children demonstrates the difference in these specified elements. (36 ref.)—*J. Chyatte.*

835. Strachey, James. **The nature of the therapeutic action of psychoanalysis.** *International Journal of Psycho-Analysis*, 1969 (Jul), Vol. 50(3), 275-292.—Advances the following 4 main points of a hypothesis: (a) The final result of psychoanalytic therapy is to enable the neurotic patient's whole mental organization, which is held in check at an infantile stage of development, to continue its progress towards a normal adult state. (b) The principal effective alteration consists in a profound qualitative modification of the patient's superego, from which the other alterations follow in the main automatically. (c) This modification of the patient's superego is brought about in a series of innumerable small steps by the agency of mutative interpretations, which are effected by the analyst in virtue of his position as object of the patient's id impulses and as auxiliary superego. (d) The fact that the mutative interpretation is the ultimate operative factor in the therapeutic action of psychoanalysis does not imply the exclusion of many other

procedures (such as suggestion, reassurance, abreaction, etc.) as elements in the treatment of any particular patient.—*Journal summary.*

836. Truax, D. B. & Lister, J. L. (U. Florida) **Effects of therapist persuasive potency in group psychotherapy.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 396-397.—3 separate group therapy populations were treated by high persuasive potency therapists. An analysis of variance was performed to study the effects of persuasive potency and patient population on patient final outcome criteria. Results indicate that persuasive potency of the therapist was an additional source of psychotherapeutic gain in the group. The greatest effect of persuasive potency was observed with juvenile delinquents. "It was suggested that while contributing independently to patient gain, persuasive potency is not a sufficient therapist condition for constructive patient personality change."—*E. J. Kronenberger.*

Group Therapy

837. Allgeyer, Jean M. (8770 Withworth Dr., Los Angeles, Calif.) **The crisis group: its unique usefulness to the disadvantaged.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 235-240.—Concludes that experience indicates that the crisis group, a valid modality for treating most people in crisis (with the exception of persons who are suicidal, homicidal, or psychotic to a degree which would be disruptive to the group; suicidal and homicidal people need more intensive professional contact and control than the group can provide) is uniquely helpful to persons of divergent racial, cultural, and socioeconomic backgrounds. When disadvantaged people can be clustered into a treatment group, their special understanding of the existential conditions affecting each other's lives and their ability to empathically and practically aid one another in coping with these problems is distinctly therapeutic. Moreover, middle-class therapists can be assisted by disadvantaged group members in providing meaningful treatment services to minorities and the poor who have been the least serviced population although they are the group with the highest incidence of mental illness.—*Journal summary.*

838. Bar-Levar, Reuven. (726 Fisher Bldg., Detroit, Mich.) **A method for dealing with a forbidden oedipal wish.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 224-229.—This case illustrates the usefulness of the splitting of transference not only among members of a group but also between visiting therapists and cotherapists. Lessening of anxiety is facilitated when the transference object is split, and fewer difficulties in working through of highly cathected, forbidden conflicts are encountered. It would seem rather obvious that the more forbidden the wish, the greater the benefit of such a situation, for the greater is the anxiety surrounding it and the more helpful is any method for reducing it.—*Journal summary.*

839. Bednar, Richard L. (U. Arkansas) **Group psychotherapy research variables.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 146-152.—Explored the treatment variables isolated for systematic investigation and the manner of measuring the treatment effects of these variables. It is felt that the independent variables most frequently investigated in group psychotherapy are poorly defined and measured. A more favorable view is presented of the dependent

variables which have been under investigation in more recent years. The methods of measurement are classified in the following 4 groupings: "(a) behavior change that is directly observable, (b) behavior change that is inferred on the basis of personality assessment procedures, (c) perception of client change by trained raters or judges, and (d) client self-perceptions of change."—*I. Linnick.*

840. **Gladdfelder, John.** (U. Texas, Southwestern Medical School, Dallas) **The use of video tape recording for supervision of group psychotherapists.** *Journal of Contemporary Psychotherapy*, 1970 (Win), Vol. 2(2), 119-123.—Suggests some goal-directed procedures which have been found particularly valuable for student therapists in using video tapes as a means of increasing self-awareness and awareness of group process. The 3 basic stages discussed include: (a) initial viewing of the overall group session without any attempt to interpret, describe or discuss, but with support and confidence building on the part of the supervisor to help the student overcome his initial anxiety; (b) initiation of an analysis of the micro, nonverbal communication systems, with the subsequent introduction of a more global approach that integrates both verbal and nonverbal communication patterns; and (c) analysis of subthemes where meaning and clinical intuition are translated into actual practice. The role of the supervisor in this process is described, and the advantages and disadvantages of the use of video tape are discussed. It is emphasized that video tape does not "replace any other supervisory technique, but represents an additional and valuable tool."—*M. Maney.*

841. **Kline, Milton V.** (Fairleigh Dickinson U., School of Dentistry) **The use of extended group hypnotherapy sessions in controlling cigarette habituation.** *International Journal of Clinical & Experimental Hypnosis*, 1970 (Oct), Vol. 18(4), 270-282.—Results of the present experimental approach to the treatment of smoking habituation tend to be consistent with the view of smoking habituation as a dependence reaction, parallel to drug addiction, and with the concept that habituation must be examined as a psychosomatic entity. Therapeutic approaches must take into account the psychophysiological characteristics of deprivation behavior. Hypnosis, and particularly extended periods of hypnotherapy involving the reduction and control of deprivation behavior, seems to offer a promising approach to the therapeutic treatment of smoking habituation. (German & Spanish summaries) (17 ref.)—*Journal abstract.*

842. **Lion, John R. & Bach-Y-Rita, George.** (U.S. Naval Hosp., Philadelphia, Pa.) **Group psychotherapy with violent outpatients.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 185-191.—The group is described as "an ongoing therapeutic modality available to members in times of stress." It provided the patients with a social experience where they no longer saw themselves as unique in terms of their problems of aggression, where they had an opportunity to ventilate anger, and where they learned new ways of coping with anger and impulsivity. The 16 patients demonstrated neither any violent activity within the group, nor showed any increased violent behavior outside of therapy. "Numerous violence-prone patients enter psychiatric facilities and ask for help. Our experience suggests that the impulsive behavior of these patients can be modified through group therapy on an outpatient basis."—*I. Linnick.*

843. **Martin, Roger D. & Zingle, Harvey W.** (U.

Saskatchewan, Saskatoon, Canada) **Videotape equipment and procedures in group settings.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 230-234.—Presents several practical suggestions regarding the basic system design, selection of appropriate equipment, and operation procedures for videotape work in group settings. A simple fixed-camera arrangement which will function adequately for most group situations is described. This provides a basic system which is fully portable, requires no special operators or technicians, and can serve as the foundation for expansion into more complex and ambitious systems.—*Journal summary.*

844. **Mathis, J. L. & Collins, M.** (Rutgers State U., Medical School) **Progressive phases in group therapy of exhibitionists.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 163-169.—45 men arrested for exhibitionism were treated for the condition by mandatory group psychotherapy over a 3-yr period. Observations of the therapeutic process demonstrated 6 phases which appeared of vital significance in the final outcome: denial, acceptance, anger, disappointment, upward movement, and separation. These phases are discussed briefly in relationship to the group process, the leaders' interventions, and the final outcome.—*Journal summary.*

845. **Rabin, Herbert M.** (Roosevelt Hosp., New York, N.Y.) **Preparing patients for group psychotherapy.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 135-145.—Discusses and gives examples of 5 preparatory practices: factual, recorded materials, lecture, or explanatory materials, a group experience, individualized. It is concluded that: "Individualized preparation . . . and to a lesser degree an early group experience . . . have more flexibility in dealing with forms of running from the group, resistance, and goals specific to given patients. This flexibility allows the timing of placement in the regular psychotherapy group to be more responsive to the individual patient's needs than when instructions or a standard interview is the preparation for entrance into a group." (17 ref.)—*I. Linnick.*

846. **Smith, Robert J.** (Quinnipiac Coll.) **A closer look at encounter therapies.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 192-209.—"It is this writer's thesis that the sociocultural climate of contemporary America is peculiarly suited to the theory and technique which underlie what I choose to label, 'encounter therapies,' and has resulted in their remarkable fruition and dissemination in the culture to levels rarely touched by other psychotherapeutic efforts." After discussing the challenge to intellect as manifested in educational theory, higher education, student activism, civil rights movements, "stop the (Vietnam) war" campaigns, in popular music, "sensory saturation," "message" songs, contemporary drama and "hippiedom," the trend away from intellect as epitomized in psychotherapeutic endeavor is explored. The methodological and theoretical critiques of the therapeutic endeavors which "emphasize direct physical, emotive confrontations and are called variously sensitivity, T-, encounter and marathon group therapies," are summarized. The need for innovation in a field where "dogma has often overridden reality" is seen as deserving of trial and encouragement. It is the popularization and liberties taken with the techniques which question acceptance of these therapies without careful, long-term evaluation. (33 ref.)—*I. Linnick.*

847. **Springmann, Rafael R.** (Tel-Aviv U., Medical

School, Israel) **A large group.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 210-218.—A weekly convention of patients and staff, originally designed to regulate the therapeutic atmosphere within a psychiatric department by means of controlled ventilation and mutual feedback, developed into a useful therapeutic and didactic tool and contributed to the integration of the psychiatric ward and its patients into the general hospital.—*Journal summary*.

848. Stein, Aaron. (Mt. Sinai Medical School, City U. New York) **The nature and significance of interaction in group psychotherapy.** *International Journal of Group Psychotherapy*, 1970 (Apr), Vol. 20(2), 153-162.—Unlike so-called activity group, or therapeutic group where the "interaction among the members in the group is the therapeutic medium, with each member finding a role to fill in the life of the group," in group psychotherapy proper, "a group meets for the treatment of the individual members with the purpose of uncovering and dealing with the individual members' psychopathology. The essential elements in group psychotherapy are verbal communication and mutual interaction." 3 types of group psychotherapy are discussed and exemplified. Uncovering and interpretation vary with the different types. "The greatest amount of interpretation occurs in the analytically oriented or intensive or exploratory type of group psychotherapy; less occurs in the modified or supportive type of group psychotherapy. Little, or relatively little, occurs in group guidance and group counseling. Where the transference manifestations remain uninterpreted, a certain amount of gratification of transference needs, that is, infantile object needs, occurs and provides support for the members of the group." The "claims for extensive personality change made by the proponents of active interaction groups" are questioned, but that strengthening of defenses and diminution in the intensity of certain symptoms can occur in such group interaction is acknowledged.—*I. Linnick*.

Behavior & Conditioning Therapy

849. Chapman, J. Dudley. (367 Dunbar Dr., North Madison, O.) **Frigidity: Rapid treatment by reciprocal inhibition.** *Journal of the American Osteopathic Association*, 1968 (Apr), Vol. 67(8), 871-878.—Presents a rapid method of treatment that is directed toward allowing the frigid woman to discover her subjective sexual needs and desires without the threat of performance or reaction. This treatment has been highly effective in a group of 74 patients, 48 of whom were followed-up for 5 yr. The effectiveness of the program was directly related to the maturity of the couple as demonstrated by the ability of the husband and wife to look at their problem, discuss it, and work together for its mutual solution. 2 illustrative case reports are presented.—*Journal abstract*.

850. Clark, Francis W. (U. Oregon) **Desensitization and therapeutic relationships.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4768.

851. Collins, Robert W. (Indiana U.) **The effect of delaying the unconditioned stimulus in the conditioning treatment for enuresis.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5234.

852. Liberman, Robert. (National Inst. of Mental Health, Div. of Special Mental Health Research, Washington, D.C.) **Behavioral approaches to family and couple therapy.** *American Journal of Orthopsychiatry*, 1970 (Jan), Vol. 40(1), 106-118.—Behavioral approaches

to family and couple therapy specify the problems in concrete terms, empirically applying the principles of learning, i.e., imitative learning and operant conditioning, in working toward therapeutic goals. The key to successful family therapy can be found in the changes made in the interpersonal consequences of the family member's behavior. The 3 major areas of technical concern for the therapist are: (a) "creating and maintaining a positive therapeutic alliance; (b) making a behavioral analysis of the problem(s); and (c) implementing the behavioral principles of reinforcement and modeling to the context of ongoing interpersonal interactions." 5 case reports are presented to illustrate the mutually reinforcing or symbiotic nature of deviance in family psychopathology and the use of learning theory techniques. The relationships wherein the behavioral and learning approach to family therapy differs from the more psychoanalytic one are discussed. (23 ref.)—*Journal abstract*.

853. Pena y Lillo, S. & Guilbert, P. (U. Santiago, Chile) **A propos de 37 cas de phobies traités par une technique combinée de déconditionnement.** [37 cases of phobia treated with a combined technique of deconditioning.] *Encéphale*, 1970 (Jan), Vol. 59(1), 25-55.—Describes a technique for treatment of phobias which combines Wolpe's technique of systematic desensitization by reciprocal inhibition with the hypnosuggestive techniques of the Russian school of reflexology. A classification of phobias is presented in terms of perceptual and significant elements and this is related to an analysis in terms of primary and secondary signal systems. Results of the application of this technique to 37 patients are reported with moderate to marked improvement in 30 of the cases. (23 ref.)—*W. W. Meissner*.

854. Sloop, Edgar W. (Florida State U.) **Conditioning treatment of nocturnal enuresis among the institutionalized mentally retarded.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5244.

855. Trogon, Kenneth P. (U. South Carolina) **The mechanism of maximal habituation in systematic desensitization.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5245-5246.

856. Wiltz, Nicholas A. (U. Oregon) **Modification of behaviors of deviant boys through parent participation in a group technique.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4786-4787.

Special & Adjunctive Therapy

857. Arfai, E., Theano, G., Montagu, J. D., & Robin, A. A. (Runwell Hosp., Essex, England) **A controlled study of polarization in depression.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 433-434.—Running direct current between eyebrow and thigh in 19 patients produced no therapeutic changes.—*R. L. Sulzer*.

858. Baumann, Franz. (San Francisco Children's Hosp., Calif.) **Hypnosis and the adolescent drug abuser.** *American Journal of Clinical Hypnosis*, 1970 (Jul), Vol. 13(1), 17-21.—Reports the results obtained with an accidentally discovered technique of hypnotherapy over a 5-yr period with adolescent drug abusers.—*M. V. Kline*.

859. Crasilneck, Harold B. & Hall, James A. (5635 Yolando Circle, Dallas, Tex.) **The use of hypnosis in the rehabilitation of complicated vascular and post-traumatic neurological patients.** *International Journal of Clinical & Experimental Hypnosis*, 1970 (Jul), Vol. 18(3), 145-159.—Found hypnotherapy of value in

rehabilitation of patients experiencing difficulty in the usual procedures which follow cerebrovascular or traumatic brain injury. 3 cases illustrate the approach taken. Of 25 similar cases seen over a 9-yr period, 4 were unresponsive to hypnosis. Although an increase in motivation for recovery seemed to be the major change elicited by hypnotherapy, other theoretical possibilities are mentioned. Hypnosis is a useful way of approaching motivational problems in rehabilitating patients who manifest negativism toward conventional treatment. (Spanish & German summaries)—*Journal abstract*.

860. Grecu, C., Stanciu, E., Csiky, C., & Balint, R. *Metode de aplicare a socului electric in Clinica de Psihiatrie din Tirgu Mures*. [Methods for the application of electric shock in the clinic of psychiatrics from Tirgu Mures.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Jan), Vol. 13(1), 55-62.

861. LaViolet, Ruth; Osorio, Luiz C., & Celia, Salvador A. (New York Medical Coll., N.Y.) *Milieu therapy in Brazil*. *American Journal of Orthopsychiatry*, 1970 (Jan), Vol. 40(1), 119-134.—Presents 2 papers, describing the establishment of child services at the Kanner Institute in Porto Alegre, which offers outpatient, day treatment, and residential services. The residential treatment services, which take care of 40 5-14 yr. olds with a variety of diagnoses are described. The 1st paper presents an analysis of milieu therapy and its use in the treatment of child psychosis. The 2nd report explains how the therapeutic community of the Kanner Institute reached a high level of integration and operation after the establishment of a club for children. —A. M. Berg.

862. Maxwell, R. D. (Leeds Regional Hosp. Board, England) *Electrical factors in electroconvulsive therapy*. *Acta Psychiatrica Scandinavica*, 1968, Vol. 44(4), 436-448.—Describes a method of measuring dosage of the electrical energy used in ECS therapy. Using EEG assessment, a rise in the fit threshold, which has occurred since the introduction of this form of treatment, has been confirmed and is ascribed mainly to the action of the iv barbiturate used in the technique of modifying the seizure by a muscle relaxant. As an alternative to overcoming the raised threshold by increasing the dosage, a sharp wave stimulator has been used and its increased efficiency determined. It is concluded that stimulators for this purpose should be calibrated in recognized units of dosage such as watt sec. or joules and that their effectiveness should be confirmed by examination of a localized unmodified seizure. (22 ref.)—*Journal summary*.

863. Owens, Herbert E. *Hypnosis and psychotherapy in dentistry: Five case histories*. *International Journal of Clinical & Experimental Hypnosis*, 1970 (Jul), Vol. 18(3), 181-193.—Used hypnosis to facilitate dental psychotherapy in resolving problems specific to the dental situation. Case histories illustrate the use of hypnosis in alleviating dentophobia and in the care and control of allergic responses. Formal induction procedures are not always necessary in achieving the desired result. Through the appropriate use of hypnosis, observable benefits can accrue to some dental patients in their ability to approach the dental situation and receive proper care. (Spanish & German summaries)—*Journal abstract*.

864. Sacerdote, Paul. (11 Carwall Ave., Mt. Vernon, N.Y.) *Theory and practice of pain control in malignancy and other protracted or recurring painful*

illnesses. *International Journal of Clinical & Experimental Hypnosis*, 1970 (Jul), Vol. 18(3), 160-180.—Recent neuroanatomical and neurophysiological experimental data suggest absence or presence of pain and changes in pain intensity as expressions of the balance between sensory (peripheral) and central (centrifugal) inputs at synaptic stations. Psychological activities by contributing to the centrifugal input influence conduction, transduction, and perception of pain stimuli. Hypnotically induced analgesia and anesthesia are therefore acceptable as neurophysiological realities. Methods for hypnotic alterations of pain based upon these premises are described utilizing neurophysiological mechanisms, psychodynamic changes, establishment of new behavioral patterns, or changes in time-space concepts and percepts. Case presentations illustrate some of these multiple psychological and physiological approaches to pain control. (Spanish & German summaries) (28 ref.)—*Journal abstract*.

865. Stein, Kenneth M. (U. Oregon) *A challenge to the role of the crisis concept in emergency psychotherapy*. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5245.

Drug Therapy

866. Ayd, Frank J. *Treating disturbed adolescents with haloperidol (haldol)*. *Psychosomatics*, 1969 (Nov), Vol. 10(6), 350-353.—Presents the clinical indications and technique of treatment with haloperidol. Therapeutic results from emotionally disturbed children in 4 double-blind studies using placebo, chlorpromazine, thioridazine, fluphenazine as well as clinical practice indicate "moderate to marked symptomatic improvement" in the majority of appropriately selected patients. It is cautioned that haloperidol may cause minor side effects or extrapyramidal reactions. (19 ref.)—G. Steele.

867. Clyde, Dean J. (U. Miami, Biometric Lab.) *Patterns of reaction to drug treatments derived through multivariate procedures*. *Public Health Service Publication*, 1968, No. 1584, 483-491.

868. Daneman, E. Adams. (U. Florida, Coll. of Medicine) *A comparative trial of medazepam (nobrium) in anxiety-depressive states*. *Psychosomatics*, 1969 (Nov), Vol. 10(6), 366-369.—Compared medazepam, and phenobarbital for effectiveness in a double-blind, crossover study comprised of 92 patients with anxiety-depressive symptoms. $\frac{1}{2}$ of the Ss received medazepam, 30 mg/day and the other $\frac{1}{2}$ phenobarbital, 90 mg/day during the 1st 2 wk., then Ss were crossed over to the alternate drug for the 2nd 2 wk. All Ss were rated with respect to symptom severity prior to and upon termination of each treatment regimen. Statistical analysis showed significant differences ($p < .05$) favoring medazepam over phenobarbital with respect to 17 of 34 symptoms rated. 7 of 10 predominant symptoms showed highly significant improvement differences ($p < .001$) favoring medazepam. Medazepam also produced significantly better results ($p < .001$) in overall clinical improvement and symptom averages. Side effects occurred in 18 Ss during medazepam therapy, and in 41 Ss on phenobarbital. During the 1st few days of therapy, 6 Ss on medazepam and 9 on phenobarbital showed significant reactions which responded to adjustment in dosage and did not warrant discontinuation of the medication. Results indicate that medazepam can relieve anxiety and associated depressive symptoms and war-

rants further clinical investigation.—*Journal summary.*

869. Denson, R. & Sydiaba, D. (University Hosp., Saskatoon, Saskatchewan, Canada) **A controlled study of LSD treatment in alcoholism and neurosis.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 443-445.—Personality inventories and standard tests failed to show any therapeutic effect of 79 LSD experiences given to 25 patients.—R. L. Sulzer.

870. Diamond, Seymour & Baltes, Bernard J. (Chicago Medical School, Ill.) **The office treatment of mixed anxiety and depression with combination therapy.** *Psychosomatics*, 1969 (Nov), Vol. 10(6), 360-365.—Presented a double-blind study of 104 patients with mixed anxiety and depression. Amitriptyline (10 mg.) with perphenazine (2 mg.) was compared with perphenazine (2 mg.) and placebo. The combination showed statistically significant improvement in the treatment of mixed anxiety and depression over perphenazine alone or placebo. The presenting target symptoms improved and headache showed an excellent improvement with the combination.—*Journal summary.*

871. Fielding, John M. (U. Melbourne, Parkville Psychiatric Unit, Victoria, Australia) **A double-blind comparative trial of dibenzepin and imipramine.** *Medical Journal of Australia*, 1969 (Mar), Vol. 1(12), 614-616.—Describes a double-blind comparative trial of the effects, over a period of 4 wk., of dibenzepin and imipramine, at fixed dosages. There was no significant difference in the speed of effect of the 2 drugs in depressed patients. Previously reported side effects rated subjectively by patients were maximal before starting on the drugs and tended to decrease with time. These effects may be depressive symptoms rather than side effects of the medication.—*Journal summary.*

872. Genevieve, J. M. **Intérêt d'un nouvel activateur du métabolisme cérébral, le cyprodemanol, dans le domaine de la psychiatrie des vieillards.** [Interest in a new cerebral metabolic activator, cyprodemanol, in the area of geriatric psychiatry.] *Encéphale*, 1970 (Jan), Vol. 59(1), 90-95.—Cyprodemanol is a neurostimulant which acts in geriatric patients in a normalizing fashion, particularly affecting psychomotor functions. The anticonfusal effect is negligible. Tolerance is excellent, allowing for initial somnolence which disappears spontaneously.—W. W. Meissner.

873. Henderson, James G. & Dawson, Audrey A. (Ross Clinic, Aberdeen, Scotland) **Serum vitamin-B₁₂ levels in psychiatric patients on long-term psychotropic drug therapy.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 439-442.—Clinical study of patients shows vitamin-B₁₂ within normal limits despite more than 6 yr. on chlorpromazine and related drugs.—R. L. Sulzer.

874. Jick, Hershel; Slone, Dennis; Shapiro, Samuel, & Lewis, George P. (Tufts U., School of Medicine) **Clinical effects of hypnotics: I. A controlled trial.** *JAMA: Journal of the American Medical Association*, 1969 (Sep), Vol. 209(13), 2013-2015.—A controlled trial comparing 3 hypnotic drugs—chloral betaine, 750 mg.; diphenhydramine hydrochloride, 50 mg.; pentobarbital, 100 mg.—and a placebo was introduced into a comprehensive drug surveillance program. Methods entailed judgments made by the attending physicians on the efficacy and side effects of drugs. There was some evidence of a higher frequency of side effects among patients who received hypnotic drugs. The efficacy of the placebo was greater among women, while the hypnotic

drugs were equally effective among both sexes. It is concluded: that physicians' judgments of efficacy and side effects are valid to the extent of permitting the demonstration of differences between hypnotic drugs and the placebo, under the conditions of a randomized, double-blind trial.—*Journal abstract.*

875. Kelly, Desmond, et al. (Atkinson Morely's Hosp., London, England) **Treatment of phobic states with antidepressants: A retrospective study of 246 patients.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 387-398.—Regardless of personality or type of phobia, wide improvement and results superior to those of behavior therapy or psychotherapy were found as a result of administration of MAO inhibitor alone or combined with chlordiazepoxide or a tricyclic antidepressant. Children improved as well as adults, but long-term maintenance therapy was usually not necessary. (33 ref.)—R. L. Sulzer.

876. Klein, Donald F. (Hillside Hosp., Glen Oaks, N.Y.) **Diagnosis and pattern of reaction to drug treatment: Clinically derived formulations.** *Public Health Service Publication*, 1968, No. 1584, 466-483.

877. Raskin, Allen; Schulterbrandt, Joy G., Reatig, Natalie, & McKeon, James J. (National Inst. of Mental Health, Psychopharmacology Research Branch, Chevy Chase, Md.) **Differential response to chlorpromazine, imipramine, and placebo: A study of subgroups of hospitalized depressed patients.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 164-173.—Investigated responses of 555 patients from 10 hospitals to chlorpromazine, imipramine, and a placebo in a double-blind study extending over a 7-wk treatment period. Ss were categorized into 3 subgroups of depression: neurotic, psychotic, and schizophrenic. Results suggest that: (a) imipramine was preferred for psychotic depressives, (b) "placebo was as effective as imipramine or chlorpromazine for the neurotic depressives," and little treatment differences were found for the schizophrenic depressives. Because treatment differences on outcome measures were small, though statistically significant, it is concluded that "for many depressed patients, drugs play a minor role in influencing the clinical course of their illness." (40 ref.)—P. McMillan.

878. Shapiro, Samuel; Sloane, Dennis; Lewis, George P., & Jick, Hershel. (Tufts U., School of Medicine) **Clinical effects of hypnotics: II. An epidemiological study.** *JAMA: Journal of the American Medical Association*, 1969 (Sep), Vol. 209(13), 2016-2020.—Examines the clinical effects of 4 of the most commonly prescribed hypnotic drugs (chloral hydrate, diphenhydramine hydrochloride, secobarbital, and phenobarbital) in 3 Boston hospitals. Of 4177 patients studied, 2045 were given 1 or more of the drugs for insomnia. When a judgment could be made, treatment with each of the 4 drugs was considered satisfactory in 60-80% of the patients and the frequencies of patients with adverse reactions varied between 1.8 and 5.1%. Major clinical reactions were infrequent and all of the adverse reactions were followed by recovery. Side effects which were experienced by some females who received secobarbital or pentobarbital were significantly associated with low body weight.—*Journal abstract.*

879. Shmilovich, L. A. & Polyak, A. I. (Republic Psychiatric Hosp. No. 1, Kishinev, USSR) **Kupirovanie épilepticheskogo statusa i serinykh prlpadkov amital-kofeinom.** [Interruption of status epilepticus and serial attacks by amital-caffeine.] *Zhurnal Nevropatologii*

i Psikhiatrii, 1970 (Jan), Vol. 70(1), 125-127.—Based on work with 50 patients, recommendations for the use of amytal-caffeine in terminating epileptic serial attacks and status are presented.—*I. D. London.*

880. Stephens, J. H. & Shaffer, J. W. (Johns Hopkins U., Medical School) **A controlled study of the effects of diphenylhydantoin on anxiety, irritability, and anger in neurotic outpatients.** *Psychopharmacologia*, 1970, Vol. 17(2), 169-181.—In a 6-wk double-blind crossover study 100-mg diphenylhydantoin (DPH), 3 times/day, was found to be more effective than 5-mg DPH 3 times/day used as a placebo, in reducing symptoms relating to anger, irritability, impatience, and anxiety. The psychoactive properties of DPH were demonstrated by self-ratings and physician ratings. No undesirable side effects were noted. Patients in the controlled study were selected on the basis of the presence of symptoms of anger, irritability, and anxiety, a social class more typical of private patients than clinic patients.—*P. Federman.*

HOSPITAL CARE & INSTITUTIONALIZATION

881. Ables, Billie S. & Newton, J. R. (U. Kentucky, Medical School) **The diagnostic evaluation on a child psychiatry outpatient service from the perspectives of parents and staff.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 384-386.—Data gathered from questionnaires administered to 16 families at the beginning and end of a diagnostic evaluation on a child psychiatry outpatient service were analyzed by examining parents' responses and staff responses. The results failed to reveal any consistent tendency for parents to view their problems as more psychologically vs. externally determined. Change scores for parents were rated. "The findings further suggest an underestimation by the staff of the degree of satisfaction expressed by the parents with the process of a diagnostic evaluation."—*E. J. Kronenberger.*

882. Chess, Stella & Lyman, Margaret S. (New York, U., Medical Center) **A psychiatric unit in a general hospital pediatric clinic.** *American Journal of Orthopsychiatry*, 1969 (Jan), Vol. 39(1), 77-85.—Describes new approaches embodied in the psychiatric unit of New York City's Bellevue Hospital pediatric outpatient department. Based on interdisciplinary teamwork, the changes facilitate quick evaluation and flexible work-up and treatment programs.—*Journal abstract.*

883. Clarke, D. F. (Ladysbridge Hosp., Banff, Scotland) **The psychologist and interpersonal relationships in a mental subnormality hospital.** *Journal of Mental Subnormality*, 1970 (Jun), Vol. 16(1), 33-44.—Presents the thesis that the nature of and the manipulation of interpersonal relationships in a mental subnormality hospital are constrained by 2 main features: (a) the characteristics of the hospital as a total institution; and (b) the fact that the organizational structure and ethos of such hospitals tend to follow the medical model, which is not really appropriate to the aims and activities of hospitals of this type. The clinical psychologist is seen as an important figure in the control and mediation of interpersonal relationships both between staff and patients and within staff and patient groups. The role of his training in social psychology and behavior modification in supporting his unique participant role, and implications of the division of his function into executive and professional roles are

discussed. Practical proposals which may facilitate the development of enriched working and caring relationships in which the boundaries between staff, patients, and community are broken down are suggested. (18 ref.)—*Journal summary.*

884. Crane, K. W. (Ingrebourne Centre, Hornchurch, England) **Psychiatric social workers in the therapeutic community.** *British Journal of Psychiatric Social Work*, 1968 (Spr), Vol. 9(3), 145-151.—Clarifies the role of social workers as members of multidisciplinary teams by: (a) identifying caseworker skills, (b) delineating processes found in casework practice and community methods, and (c) indicating therapeutic and anti-therapeutic effects of traditional casework.

885. Don, Yehuda & Amir, Yehuda. (Bar-Ilan U., Ramat-Gan, Israel) **Institutionalized care for mentally retarded in Israel.** *Mental Retardation*, 1968 (Oct), Vol. 6(5), 29-31.—Reviewed the institutionalization and care of retarded children in Israel—its scope, the process of diagnosis, ways of referral, and types of institutions. An economic-psychological study which investigated why the maintenance in government institutions is more expensive than in private or publicly owned institutions was also summarized.—*Journal abstract.*

886. Dybwad, Gunnar. (Brandeis U.) **Architecture and mental subnormality: I. Architecture's role in revitalizing the field of mental retardation.** *Journal of Mental Subnormality*, 1970 (Jun), Vol. 16(1), 45-48.—Discusses the role of the architect in planning and furnishing residential or day facilities for the mentally subnormal. The need for a close contact between the architect and the working staff in all areas of consideration is discussed, stressing that area concerned with the space set aside for the staff. It is suggested that here a trend toward a "more human, more relaxing... space" would reduce the image of these facilities as "hospitals." It is concluded that the therapeutic effect of specific environments needs further research in controlled settings.—*M. Maney.*

887. Fearn, Gordon F. (Indiana U.) **Stability and change in the structure of self.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5065.

888. Levine, D. (U. Nebraska) **Criminal behavior and mental institutionalization.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 279-284.—Investigated 3 hypotheses dealing with admission to mental hospitals and the community's attitude about their abnormal behavior. It was found that people showing symptoms which threaten the community are more likely to be mental hospital patients than those who do not threaten the community. 70% of the mental hospital patients in this sample had broken the law. A correlation of .51 was obtained between the number of months a schizophrenic patient spends in a mental hospital and the number of months he would have been sentenced to jail.—*E. J. Kronenberger.*

889. McQueen, Robert. (U. Nevada) **Problems of converting a state mental hospital into an open-staff facility.** *Psychiatry, Washington, D.C.*, 1970 (Feb), Vol. 33(1), 119-126.—Reports the process of changing a traditional state mental hospital into a more community oriented facility by involving local physicians and psychiatrists in the treatment program. Many of the sociological problems involved in the professional staff-outsider conflict are noted.—*E. Upchurch.*

890. Mendelsohn, Robert S. **The disturbed child: Help on the horizon.** *Child & Family*, 1968 (Sum), Vol.

7(3), 242-248.—Presents a 4-yr study in 2 large state mental hospitals on the roles of the pediatrician, parental organization and participation, artificial families, and family-centered outpatient activities in the treatment of emotionally disturbed children. It is concluded that all were beneficial when conducted on a personal level showing genuine interest and concern.—G. Steele.

891. Pantleo, P. M. (U. Colorado) **Climatic temperature and psychiatric admissions.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 308-310.—Analyzed psychiatric admissions by conventional calendar quarters and by temperature groups. It was found that crude measures not controlling for temperature fluctuations yield 1 result while more refined measures yield contradictory findings. When monthly admission rates were grouped by temperature or correlated with that month's respective temperature no difference was rated which suggested that seasonal grouping may be inadequate.—E. J. Kronenberger.

892. Parnicky, Joseph J. (E. R. Johnstone Training & Research Center, Bordentown, N.J.) **An audio-visual approach to employee orientation in a small institution.** *Mental Retardation*, 1968 (Oct), Vol. 6(5), 32-34.—After experimenting with several methods in orienting new employees, the Johnstone Training and Research Center developed an audio-visual technique that may have application in other institutions of comparable size and with comparable administrative conditions.—*Journal abstract*.

893. Rosenberg, Stanley D. (Dartmouth Coll., Medical School) **Hospital culture as collective defense.** *Psychiatry, Washington, D.C.*, 1970 (Feb), Vol. 33(1), 21-35.—Presents the thesis that "hospital social culture can be better understood as a highly interwoven system which is integrated around a set of shared unconscious problems, defenses, and myths." Patients, particularly chronic ones, help to maintain the hospital status quo in order to fulfill their own needs (mainly dependency) which permits the staff groups to defend against their own manipulations of these patients. Much of the material is based on Goffman's book *Asylums* and shows how the "total institution" is not just an imposition of rules by the maintainers against the maintained but is a collusion between them to satisfy mutual needs. (15 ref.)—E. Uprichard.

894. Whiteley, J. Stuart. (Henderson Hosp., Sutton, England) **The response of psychopaths to a therapeutic community.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 517-529.—With a criterion of no further convictions nor psychiatric admissions for 2 yr., a 40% improvement rate was shown by discharges from a therapeutic community. Prognostic factors indicative of a good outcome are previous success in school, work, and interpersonal relations, plus a capacity for emotional feeling and involvement. The stimulating and permissive environment of the therapeutic community would be of less value to the more immature, persistently acting-out psychopath, and is doubtful for the aggressive psychopath.—R. L. Sulzer.

895. Wright, M. (St. Francis Hosp., Haywards Heath, England) **Therapeutic community ideas applied in an acute unit of a psychiatric hospital.** *British Journal of Psychiatric Social Work*, 1968 (Spr), Vol. 9(3), 152-156.—Describes the problems and opportunities encountered in the use of therapeutic community principles with hospitalized seriously disturbed patients. Benefits for different types of patients are reviewed.

PSYCHOANALYTIC INTERPRETATION

896. Berk, Tom J. (41 Kiefskamp, Amsterdam, Holland) **Some results of modern brain research supporting psychoanalytical theories.** *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 40-52.—Discusses areas of current brain research which provide data relevant to psychoanalytic theory. These areas include: (a) psychomimetic drugs, (b) the influence of the reticular formation on emotions, (c) contradictory sleep studies, and (d) cerebral organization in relation to libidinal organization. (German summary) (28 ref.)—B. A. Stanton.

897. Eissler, K. R. **The relation of explaining and understanding in psychoanalysis: Demonstrated by one aspect of Freud's approach to literature.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 141-177.—The answer to the question of whether psychoanalysis is a science or one of the humanities lies in the correct analysis of the relationship of explaining and understanding to psychoanalysis. This question is examined "in relation to the contribution that psychoanalysis can make to the study of literature." Freud's approach to literature is also discussed. (40 ref.)—B. A. Stanton.

898. Garma, Angel. **Present thoughts on Freud's theory of dream hallucination.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 485-494.—Dream hallucination arises when the counteractives of the ego are diminished during sleep and can no longer control the repressed psychic contents which give rise to dreams. Contrary to Freud's theory of reality testing, the uncontrollable psychic contents seem to convince the sleeping ego that they are real (external) because in the ego's waking experience it is less able to control psychic contents which originate in the actual external reality, than psychic contents which arise spontaneously. The dream screen is a luminous surface on to which the dream contents are projected. Its light is a primordial hallucination, present in every dream. This primordial hallucination comes from a reactivation of the repressed memory of the dazzling vision of light which was received at the moment of birth.—*Journal summary*.

899. Gillespie, W. H. **Concepts of vaginal orgasm.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 495-497.—Technical progress in analytic fields reveals facts highly relevant to analysis. These were unknown when Freud constructed his theories. New data in the sex area indicate that a reconsideration or revision of traditional theory is needed. Freud indicated females must substitute the vagina for the clitoris as the leading erotogenic zone and must accept a passive rather than an active aim. Masters and Johnson find it is impossible to separate the clitoral from the vaginal orgasm as demanded by psychoanalytic theory.—J. Chyatte.

900. Glenn, Jules. **Testicular and scrotal masturbation.** *International Journal of Psycho-Analysis*, 1969 (Jul), Vol. 50(3), 353-362.—Describes 3 cases of testicular or scrotal masturbation. Factors are described which lead to patients associating the testicle-scrotum area with both femininity and passivity, emphasizing the role of genital sensations and noting that there is more perceived activity in the penis than inside the scrotal sac during sexual excitement and orgasm. Biological factors appear to make the penis feel more active even in childhood. Testicular cathexis and castration anxiety is

more pronounced in some persons, while in most men phallic cathexis and castration fear prevail. The greater frequency of penile cathexis and castration anxiety may be associated with passivity and femininity, and the penis with activity and masculinity. Men generally fear losing the active masculine part more than the feminine passive part. Factors contributing to testicular and/or scrotal cathexis are: displacement from the penis, direct threats to the testicles, marked testicular stimulation early in life, threats to organs symbolically associated with the testes, constitutional factors, and tendencies toward masochism and passivity.—*J. Chyatte.*

901. Hoffer, Willie. **Notes on the theory of defense.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 178-188.—Chronologically traces the development of the concept of defense and the defense processes. The defense process is discussed in terms of Freud's model which states that "defensive processes are the psychical correlative of the flight reflex and perform the task of preventing the generation of unpleasure from internal sources." The mechanisms of defense and defense organization are also examined. (35 ref.)—*B. A. Stanton.*

902. Jaffe, Daniel S. **Forgetting and remembering: Defensive cathectic shift as a determinant of parapraxis and its resolution.** *Psychoanalytic Quarterly*, 1970 (Jul), Vol. 39(3), 372-388.—Presents a psychoanalytic formulation.—*J. Z. Elias.*

903. Joffe, Walter G. **A critical review of the status of the envy concept.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 533-545.—The concept of envy as a primary inborn instinctual drive is completely rejected. It is seen rather as a complicated attitude which occurs as part of normal development and which is closely related to such other attitudes as possessiveness. It is linked with aggression and destructiveness, but the aggressive component and the fantasies linked with it can be drawn from all phases of development, and is not only oral in nature. Rather than being seen as a primary drive, it can be seen as a secondary motivating force which may have positive and adaptive consequences in ongoing development or may lead to the most malignant pathology. It has an intimate relation to the state of the individual's narcissism and self-esteem, and the essential stimulus to its development lies in disturbances within that domain. (36 ref.)—*Journal summary.*

904. Katan, Maurits. **The link between Freud's works on aphasia, fetishism and constructions in analysis.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 547-553.—The aphasic speech remnant of the individual is interpreted as an attempt to preserve speech and is connected to the emotional moments before the gross organic lesion strikes. In intense reality danger, a person's thoughts result from the ego's attempts to avoid total dissolution. The neurotic instead of intense reality danger has internal instinctual desires which are dangerous and uses the fetish to repeat the pretraumatic situation. Recalled childhood memory is a repetition of pretraumatic situations which the ego defended against. (24 ref.)—*J. Chyatte.*

905. Kramer, Maria K. **A study of the paintings of Vermeer of Delft.** *Psychoanalytic Quarterly*, 1970 (Jul), Vol. 39(3), 389-426.—Presents a psychoanalytic study of the works of the Dutch painter, Jan Vermeer.—*J. Z. Elias.*

906. Laufer, Moses. **The body image, the function of masturbation, and adolescence: Problems of**

ownership of the body. *Psychoanalytic Study of the Child*, 1968, Vol. 23, 114-137.—Reviews the literature concerning the body image and masturbation. Case histories are presented to illustrate adolescent body image disturbances and masturbation fantasies. The following are common body image disturbances: (a) dissociation from the mature body during puberty, (b) failure of oedipal identifications, (c) oedipal aggression, and (d) overwhelming guilt. These adolescents are seen to regard masturbation either as proof of their abnormality or as a threat to their whole ego functioning. They hate their bodies, but they feel helpless when confronted with fantasies. The hatred of the body is discussed and interpreted as a hatred of the internalized parent. (55 ref.)—*B. A. Stanton.*

907. Lustman, Seymour L. **The economic point of view and defense.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 189-203.—Examines the economic concept and point of view in relation to psychoanalytic theory. (30 ref.)

908. Moses, Rafael. **Form and content: An ego-psychological view.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 204-223.—"Psychoanalytic ego psychology as it stands today provides us with the theoretical framework for an exploration of the formal aspects of behavior as distinct from its motivational content. These formal aspects can be linked to ego functioning and ego structures." The interplay between form and content is discussed in relation to ego psychology. (75 ref.)—*B. A. Stanton.*

909. Noy, Pinchas. (Hebrew U., Jerusalem, Israel) **The development of musical ability.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 332-347.—Hypothesizes that the language of music is derived from preverbal, infantile auditory communication. Emphasizes that the elements of music (tone, pitch, timbre, duration, rhythm, and intensity) are all components of infantile, preverbal auditory communication. Artistic endowment is seen to result from retention of these components into adulthood. Examples of musical compositions are used to demonstrate how reactions to music result from regressions to earlier experiences. (25 ref.)—*B. A. Stanton.*

910. Rangell, Leo. **Choice-conflict and the decision-making function of the ego: A psychoanalytic contribution to decision theory.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 599-602.—Among the ego functions is a decision-making one. An attempt is being made to discover the historical antecedents of the individual's decision making and especially the unconscious ones. The ego, through internal scanning, screens the present partial gratification through past memories to ascertain if past traumatic data is revived and then either signals safety or anxiety. If anxiety is signaled, the ego has an internal intrasystemic decision dilemma to handle. There is ego "conflict" as to what to do next. The ego has choices and is obliged to make one. Unconscious and genetic determinants heavily decide what happens in these internal conflicts. Decision-making theory is important in present-day situations where decisions by 1 individual involve consequences for whole populations.—*J. Chyatte.*

911. Rosen, Victor H. **Sign phenomena and their relationship to unconscious meaning.** *International Journal of Psycho-Analysis*, 1969 (Apr), Vol. 50(2), 197-207.—Primary process may be largely a signaling and signifying activity; secondary process may be largely a use of symbols which have arbitrary conventional

referents. Sign phenomena are important in establishing unconscious meaning perhaps due to early signal systems set up between parent and child. Interpretation is a translation of signs-signals into referents. Free association is a replication of the disturbed encoding function in an attempt to determine, in controlled conditions, how the sign-signal functions went astray originally. "Unconscious meaning are the inferences we draw from this replication." (24 ref.)—*J. Chyatte*.

912. **Schur, Max. Affects and cognition.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 647-653.—Attempted to reformulate Freud's signal concept by emphasizing the cognitive process and by eliminating his anthropomorphic-teleological formulations, and extend the signal concept to other affects. This reformulation made Freud's objection to the existence of unconscious affects invalid. It is concluded, on the basis of these reconsiderations, that the cognitive factor was an intrinsic part of all affects. This formulation is believed to be a logical extension of Freud's definition "anxiety is a reaction to danger," and that it permits a full reconciliation of affect theory with the structural viewpoint. (26 ref.)—*Journal summary*.

913. **Silber, Austin. A patient's gift: Its meaning and function.** *International Journal of Psycho-Analysis*, 1969 (Jul), Vol. 50(3), 335-341.—Gifts can bind the receiver symbiotically to the giver. Children do not love for the gift as much as they feel the gift is love. To them giving and gift equal love. One patient's departing gift of an ashtray is analyzed in view of his subsequent resumption of analysis. Multiple meanings are possible when a gift is given.—*J. Chyatte*.

914. **Smirnoff, Victor N. The masochistic contract.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 665-671.—Describes Sacher-Masoch's 1870 contract with his wife. She was to flog him and mistreat him and he, in turn, would eliminate cruel women from his novels. This whipping fetish is presumably related to Sacher-Masoch's witnessing his aunt's adultery, his subsequent discovery, and his severe punishment. This is interpreted as a screen memory. Love object here plays 2 roles; pure and loving and harsh and sensual. (22 ref.)—*J. Chyatte*.

915. **Winnicott, D. W. The use of an object.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 711-716.—Object-relating can be described in terms of the experience of the S. The capacity to use an object is more sophisticated than the capacity to relate to objects; and relating may be to a subjective object, but usage implies that the object is part of external reality. This sequence is observed: S relates to object, object is in the process of being found instead of placed by the S in the world, S destroys object, object survives destruction, S can use object. The object is always being destroyed. This destruction becomes the unconscious backcloth for love of a real object, i.e., an object outside the area of the S's omnipotent control. Study of this problem involves a statement of the positive value of destructiveness. The destructiveness plus the object's survival of the destruction places the object outside the area in which projective mental mechanisms operate, so that a world of shared reality is created which the S can use and which can feed back into the S.—*Journal summary*.

PSYCHODIAGNOSIS

916. **Angenent, H. L.** (Inst. of Criminology, Groningen, Netherlands) **Testgebruik door de psycho-**

loog in het kinderbeschermtehuis. [Test usage by the psychologist in the emergency homes for child protection.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970 (May), Vol. 25(5), 302-314.—Netherlands provides temporary emergency homes for children and young people, identified as transients, the temporarily employed, unwed mothers, and referrals for observation purposes and special treatment. About 15,000 children and young persons are situated in 282 such homes. A questionnaire study was conducted about the test usage by the psychologists in such homes. A total of 145 standardized tests were reported. The tests were classified in order of usage: individual and group intelligence, specific intelligence, scholastic achievement, aptitude, educational readiness, motor abilities, attention span, developmental, perception, symbol usage, memory, vocational interest, visual abilities, and color blindness. (English summary)—*A. J. Ter Keurst*.

917. **Appelbaum, Stephen A. New ways with old tests.** *Menninger Quarterly*, 1968-1969 (Win), Vol. 22(4), 22-27.

918. **Brill, Henry.** (Pilgrim State Hosp., West Brentwood, N.Y.) **The role of classification in hospital psychiatry.** *Public Health Service Publication*, 1968, No. 1584, 29-35.

919. **Clausen, John A.** (U. California, Berkeley) **Some implications of classification in sociology for problems of classification in psychiatry and psychopathology.** *Public Health Service Publication*, 1968, No. 1584, 168-173.

920. **Clum, G. A. & Clum, M. Judith.** (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Sibling position as a factor in psychiatric illness and prognosis in a military population.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 271-274.—Birth order of 600 Navy enlistees, admitted to a psychiatric inpatient service, was not related to psychiatric admission or to a psychiatric disposition of discharge from service. Only- and 1st-born children were found to have poorer prognosis upon release from a psychiatric service. "Birth order was not found to be a factor in the prognosis of patients diagnosed character disorder, but was found to differentiate successful and unsuccessful adjusters in a group diagnosed as neurotic or situational maladjustment."—*E. J. Kronenberger*.

921. **Cole, Jonathan O.** (National Inst. of Mental Health, Psychopharmacology Research Branch, Chevy Chase, Md.) **Classification in research on the prediction of response to specific treatments in psychiatry.** *Public Health Service Publication*, 1968, No. 1584, 143-147.

922. **Conners, C. Keith.** (Harvard Medical School, Boston, Mass.) **Symptom patterns in hyperkinetic, neurotic, and normal children.** *Child Development*, 1970 (Sep), Vol. 41(3), 667-682.—Factor analyzed parent symptom ratings of 316 psychiatric clinic patients and 365 normal children. Factor scores discriminated between patients and normals and neurotic and hyperkinetic groups, but the same basic factor structure appeared in the groups. Age, social class, and race effects were slight. Symptom prevalence rates were higher in patients than in a normal sample. It is concluded that there are few qualitative differences between normal and psychiatrically ill children, though they differ in severity of symptomatology.—*Journal abstract*.

923. **Cooke, Gerald & Chodorkoff, Bernard.** (Wayne State U.) **Reliability of classification of behaviors**

within psychosexual stages. *Psychological Reports*, 1970 (Jun), Vol. 26(3), 751-754.—Presented items representing nonpathological behavior, attitudes, and characteristics to a panel of 6 clinicians familiar with psychoanalytic theory. Ss were asked to assign each item of the psychosexual stage represented by it. 1 yr. later, a 2nd panel repeated the task and interjudge agreement was calculated. Temporal agreement was calculated for the 4 judges common to both panels. Results indicate that psychoanalytically trained Ss can reliably assign behaviors, attitudes, and characteristics to psychosexual stages and that agreement exceeds the level reported for the American Psychiatric Association diagnostic system.—*Journal abstract*.

924. Epstein, Leon. (U. California, Medical Center, San Francisco) **Discussion: The role of classification in psychiatric practice.** *Public Health Service Publication*, 1968, No. 1584, 72-75.

925. Epstein, Leon. (U. California, Langley Porter Neuropsychiatric Inst., San Francisco) **Discussion: The role of classification in research in psychopathology.** *Public Health Service Publication*, 1968, No. 1584, 147-154.

926. Erickson, Marilyn T., Johnson, Nancy M., & Campbell, Frances A. (U. North Carolina) **Relationships among scores on infant tests for children with developmental problems.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 102-104.—30 preschool children referred for diagnosis of developmental problems were administered the Bayley Scale of Mental Development, the Cattell Infant Intelligence Scale, and the Vineland Social Maturity Scale. Results indicate that the scores on the 2 infant tests are so similar and highly correlated that they might be considered interchangeable in diagnostic settings. Clinically, the Bayley presented advantages of a greater variety of items and separate mental and motor scales, while the Cattell took less time to administer and could be combined with the Stanford-Binet. Although significantly correlated with the 2 infant tests, the Vineland consistently yielded higher scores.—*Journal abstract*.

927. Farley, F. H. (U. Wisconsin) **Moderating effects of psychopathology on the independence of extraversion and neuroticism.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 298-299.—Normal, neurotic, acute psychotic, and chronic psychotic Ss were administered the MPI. No significant relationships were found. Most of the correlations were low and positive.—*E. J. Kronenberger*.

928. Fink, Max. (New York Medical Coll., N.Y.) **Neurophysiological response strategies in the classification of mental illness.** *Public Health Service Publication*, 1968, No. 1584, 535-540.

929. Frank, George H. (New York U.) **On the nature of borderline psychology: A review.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 61-77.—Borderline psychological functioning reflects characteristics of both neurosis and psychosis, sometimes alternatively, sometimes contemporaneously. R. R. Grinker, B. Werble, and R. C. Drye's recent book described the history and behavioral functioning of the borderline personality; absent were the characteristics as seen through the purview of psychological tests. A review of research indicated that borderline psychopathology is often difficult to detect through interview; tests seem better able to reveal the presence of the more serious psychopathology which might underlie a neurotic-looking

adjustment. The more serious pathology is made apparent when the stimuli to which the patient is responding is ambiguous or vague (i.e., the projective techniques). The focus in borderline psychopathology is placed on the underlying ego or cognitive pathology. (100 ref.)—*Author abstract*.

930. Gardner, Elmer A. (Temple U., Health Science Center, Community Mental Health Center) **The role of the classification system in outpatient psychiatry.** *Public Health Service Publication*, 1968, No. 1584, 35-53.

931. Garstide, R. F., Kay, D. W., Roy, J. R., & Beamish, Pamela. (U. Newcastle upon Tyne, England) **M.P.I. scores and symptoms of depression.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 429-432.—Examined the relationship between MPI Neuroticism (N) and Extraversion (E) scores at follow-up and various features already recorded during the index admission 5-7 yr. earlier. Retardation was associated with low N scores and somatic complaints with high N scores on the MPI. E scores were related to age, early waking, and the personality trait called "with narrow interests." N scores correlated with Hamilton Rating Scale scores at follow-up.—*R. L. Sulzer*.

933. Greenhouse, Samuel W. (National Inst. of Mental Health, Theoretical Statistics & Mathematics Section, Bethesda, Md.) **Discussion: Issues in the methodology and statistics of classification.** *Public Health Service Publication*, 1968, No. 1584, 240-246.

934. Grundvig, J. L., Needham, W. E., & Ajax, E. T. (Veterans Administration Hosp., Salt Lake City, U.) **Comparison of different scoring and administration procedures for the Memory-For-Designs test.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 353-357.—Compared 3 Memory-For-Designs (MFD) scoring systems, 2 presentations of the MFD, and 3 organic impairment groups. Under the standard 5-sec administration of the MFD, the Taylor or Modified Taylor scoring systems seemed to be best at differentiating degree of cerebral impairment, but under 1/2-sec exposure, the Graham-Kendall system was best.—*E. J. Kronenberger*.

935. Hammond, Kenneth R. (U. Colorado, Inst. of Behavioral Science) **Abnormal psychology: Nosology adrift.** *Public Health Service Publication*, 1968, No. 1584, 164-168.

936. Hammond, Leo K. (Ft. Logan Mental Health Center, Denver, Colo.) **Cognitive structure and clinical inference.** *Journal of General Psychology*, 1970 (Jul), Vol. 83(1), 107-118.—Outlines a theory of inference based upon the viewpoints of Brunswik and Heider. In this theory, inference proceeds from those characteristics of objects which are most proximal or available to perception, through the convergence of the implications of the proximal perception. The theoretical statement regarding the convergence of implications was tested by utilizing a correlational cognitive structure model. Inferences made by clinicians from clinical data concerning personality characteristics were found to follow the convergence of implications in the cognitive structure model. Thus, the way in which a clinician believes personality characteristics to be related in general was established as a determinant of the inferences he makes about individual cases. However, the diagnoses the clinicians made were not predicted successfully, and

several reasons for this failure are suggested.—*Journal summary.*

937. Holder, T., Drasgow, J., & Pierce, R. (Veterans Administration Hosp., Buffalo, N.Y.) **Examiner communication level and objective test performance.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 335.—Measure of intelligence and finger dexterity were obtained on 6 inpatients. Ratings of empathy, respect, genuineness, and concreteness, along with ratings of taped clinical interviews, were made by experienced raters. Personality characteristics of the examiner in an individual testing situation does account for some of the variability in objective test results and the concept of the "good guy" in therapy is also a factor in objective testing operations.—E. J. Kronenberger.

938. Hutt, Max L. & Gibby, Robert G. (U. Detroit) **An atlas for the Hutt Adaptation of the Bender-Gestalt Test.** New York, N.Y.: Grune & Stratton, 1970, \$2.85.

940. Kramer, Morton. (National Inst. of Mental Health, Office of Program Planning & Evaluation, Chevy Chase, Md.) **Classification of mental disorders for epidemiologic and medical care purposes: Current status, problems, and needs.** *Public Health Service Publication*, 1968, No. 1584, 99-115.

941. Kuncze, J. T., Masuda, M., & Carter, T. E. (U. Missouri) **MMPI scores, psychiatric disturbance and catecholamine metabolites.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 291-296.—Evaluated MMPI results on 44 outpatients in relation to catecholamine secretion. Interrelationships of biochemical variables, age, and sex are presented. An interrelationship of biochemical variables and the MMPI indicated a number of significant differences. Ss with primarily neurotic defenses tended to have higher catecholamine excretion levels than characterological or schizoid defense patterns. The findings were related to reaction to stress and eventual favorable prognosis.—E. J. Kronenberger.

942. Lubin, Ardie. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Discussion: Systems based on premorbid history, course of illness, or reaction to treatment.** *Public Health Service Publication*, 1968, No. 1584, 491-506.

943. Lyerly, Samuel B. (Psychological Assessment Assoc., Washington, D.C.) **A survey of some empirical clustering procedures.** *Public Health Service Publication*, 1968, No. 1584, 220-229.

944. Marks, Isaac M. (Maudsley Hosp., London, England) **The classification of phobic disorders.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 377-386.—While mild fears are ubiquitous, intense phobias are uncommon in adults. Class I phobias are those of external situations, most common being agoraphobia, and Class II are those of internal situations that cannot be escaped, such as illness or the obsessive fears of harming others or of contamination. To predict response to treatment, a simple classification is that between monosymptomatic, e.g., animals or other specific situations, and diffuse. Such a classification does not predict symptomatology, age of onset, or sex incidence. Alternatively, the best classification may take

account both of the nature of the phobic situation and its specificity. (31 ref.)—R. L. Sulzer.

945. Mons, W. E. **Typology and the Rorschach.** *British Journal of Projective Psychology & Personality Study*, 1968 (Jun), Vol. 13(1), 11-12.—Applied Rorschach signs of neurosis and hysteria to responses of 131 commando or paratroop military personnel, termed "athletic types," who had nervous breakdowns during World War II. These were compared to responses of 123 cases of "the same type of soldier" who had "civilian type" breakdowns after the war. The war group showed 55% positive signs of neurosis and 26% of hysteria, whereas the postwar group showed 30% with positive signs of neurosis and 57% signs of hysteria. Results suggest that with the removal of the anxiety-creating effect of death, the postwar group, trained to obey "the suggestive force of the command," utilized anxiety in the familiar manner of the hysteric.—P. McMillan.

946. Munro, Helle. (Belmont Hosp., London, England) **Verbal fluency in test and group situations.** *British Journal of Projective Psychology & Personality Study*, 1968 (Jun), Vol. 13(1), 25-29.—Investigated verbal behavior in group meetings and on psychological tests of 20 19-67 yr. old psychiatric patients to determine the relationship between the extent to which a person is "mentioned" in group sessions, and the verbal fluency and/or extraversion he shows on standard psychological tests and special measures of fluency (i.e., rhyming, naming animals, word associations to a picture, etc.). Results indicate that "mention" correlates significantly with 2 of the verbal fluency tests and with neuroticism as measured by Eysenck's Personality Inventory.—P. McMillan.

947. Murphy, Lois B. (Menninger Foundation, Topeka, Kan.) **Discussion of papers by Brill, Weinstein, Gleser, Overall and Hollister, and Stein and Neulinger in the light of research in human development.** *Public Health Service Publication*, 1968, No. 1584, 173-190.

948. Nuttall, R. L., Phillips, Leslie, & Rosenfeld, J. E. (Boston Coll., Inst. of Human Sciences) **Attitudes and psychiatric symptomatology.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 263-270.—Examined the relation of symptomatic behaviors and attitudinal set by having 214 1st-admission males complete 3 symptom scales established to reflect the role orientations of Turning Against the Self, Turning Against Others, and Avoidance of Others. The "results indicate that it is possible to construct attitudinal scales on which scoring corresponds to the appearance of particular types of symptoms." The sets of attitudinal items making up the 3 scales are presented in table form which includes the direction of scoring for each item. Significant results are noted in relation to symptoms and corresponding attitude scales. A cross-validation is included.—E. J. Kronenberger.

949. Overall, John E. & Hollister, Leo E. (U. Texas, Medical School, Galveston) **Studies of quantitative approaches to psychiatric classification.** *Public Health Service Publication*, 1968, No. 1584, 277-299.

950. Paulson, M. J. & Lin, Tien-Teh. (U. California, Center for the Health Sciences, Los Angeles) **Age: The neglected variable in constructing an abbreviated WAIS.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 336-343.—WAIS records of 290 psychiatric patients of mixed age, sex, diagnosis, and socioeconomic level were analyzed by age through a stepwise regression

method, multiple regression equations, and multiple correlations. Results indicate that age is a factor in deriving estimates of WAIS IQ. "The age variable should be incorporated in all studies related to the prediction of WAIS Full Scale IQ from abbreviated batteries."—E. J. Kronenberger.

951. Rao, C. Radhakrishna. (Indian Statistical Inst., Research & Training School, Calcutta) **Discrimination among groups and assigning new individuals.** *Public Health Service Publication*, 1968, No. 1584, 229-240.

952. Rice, David G. & Kepecs, Joseph G. (U. Wisconsin, Medical School) **Patient sex differences and MMPI changes: 1958 to 1969.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 185-192.—Compared a group of 100 psychiatric patients under 30 yr. old tested from 1958-1960 on MMPI responses with a carefully matched group (N = 100) tested during 1967-1969. Marked sex differences were obtained. Women in the later group had significantly higher mean clinical and supplemented MMPI scale scores than women in the earlier group. Earlier and later male groups showed few significant scale differences. Statistical analyses indicate that these findings cannot be explained in terms of a differential response "set" for men and women. Results suggest an increase in MMPI indicated psychopathology for younger women, and are discussed in terms of the rapidly changing sexual and social role expectations for women during the past decade. (19 ref.)—*Journal summary*.

953. Rickels, K., et al. (U. Pennsylvania) **Differential reliability in rating psychopathology and global improvement.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 320-323.—Reports on 2 studies dealing with ratings of degree of patient psychopathology. "The reliability of psychopathology ratings was found to be low, but the ratings of global improvement were quite reliable." Problems in dealing with global neurotic psychopathology and rating global improvement are presented.—E. J. Kronenberger.

954. Rocha, Zaldo & da Nóbrega, Maria A. (U. Pernambuco, Recife, Brazil) **Sobre a utilização de um "perfil psicológico" no diagnóstico pluri-dimensional da criança com distúrbios reativos do comportamento.** ["Psychological profile" used as the context of the pluri-dimensional diagnosis of behavior disturbances in children.] *Neuobiologia*, 1969 (Dec), Vol. 32(4), 259-264.—Proposes the elaboration of a psychological profile starting from the "animus state" or "base humor," and describes the importance of the profile in the context of the pluri-dimensional diagnosis.—*English summary*.

955. Rosenman, M. F. & Lucik, T. W. (Central State Hosp., Milledgeville, Ga.) **A failure to replicate an Epilepsy scale of the MMPI.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 372.—An epileptic group and a brain-damaged control group were compared on the Ep scale of the MMPI. The results offered no support for the concept of a characteristic epileptic personality.—E. J. Kronenberger.

956. Schoonover, Sarah M. & Hertel, Richard K. (Northwest Mental Health Center, Lima, O.) **Diagnostic implications of WISC scores.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 967-973.—Compared the WISC scores of 351 children in 9 diagnostic categories in terms of differences in subtest scores, Verbal IQ-Performance IQ difference, subtest scatter, and subtest patterning. The 9 categories, psychoneurotic disorder, personality

pattern disturbance, personality trait disturbance, sociopathic personality disturbance, special symptom reaction, transient situational personality disorder, schizophrenic reaction, chronic brain syndrome, and mental deficiency, were not differentiated adequately by any of the above techniques. (21 ref.)—*Journal abstract*.

957. Schubert, Josef. (U. Saskatchewan, Regina, Canada) **Rorschachs of asthmatic children.** *British Journal of Projective Psychology & Personality Study*, 1968 (Jun), Vol. 13(1), 17-23.—The Rorschach and the WISC test responses of 57 6-14 yr. old asthmatic children to determine: (a) characteristics of these Ss compared to other referrals, and (b) whether there are subgroups within the asthmatic patient population. Ss were characterized according to whether their asthma was mild or severe, and whether their parents were ambivalent (A Group) or protective (O Group). Results indicate that A Group Ss were more likely to have severe asthma, to be emotionally constricted, and to respond to psychological treatment, whereas O Group Ss tended to show poorer psychological differentiation, give in easily, and "act out" their tensions.—P. McMillan.

958. Shakow, David. (National Inst. of Mental Health, Lab. of Psychology, Bethesda, Md.) **The role of classification in the development of the science of psychopathology with particular reference to research.** *Public Health Service Publication*, 1968, No. 1584, 116-143.

959. Shechtman, Audrey. (DePaul U.) **Age patterns in children's psychiatric symptoms.** *Child Development*, 1970 (Sep), Vol. 41(3), 683-693.—Studied age trends of childhood behaviors commonly considered symptomatic of pathology in 317 male and 229 female 5-17 yr. old outpatients in a mental health clinic. Data were also analyzed in terms of the externalizer-internalizer and severe and diffuse psychopathology factors derived by T. M. Achenbach. More symptoms appeared in younger Ss with a decrease in number over the age span studied. Age trends were demonstrated for specific traits. Rare traits were often those appearing in the severe and diffuse psychopathology factor or seemed to be age linked. Males were not differentiated on the externalizing-internalizing factor, while 9-14 yr. old females exhibited predominantly internalizing behaviors. It is concluded that age trends in symptoms are manifested in childhood which may have implications for the interpretation and classification of behavior disorders.—*Journal abstract*.

960. Sennett, E. R. & Stone, L. A. (Kansas State U.) **Ratio scaling of students on a judged adjustment continuum.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 317-320.—3 judges made magnitude estimations of the overall mental health status of 19 students residing in a rehabilitation living unit. The results led to conclusions dealing with direct-estimation methods to scale professional judgment, reliability, and subjective magnitude impressions.—E. J. Kronenberger.

961. Spiegel, D., Hadley, A., & Hadley, R. G. (Veterans Administration Center, Brentwood Hosp., Los Angeles, Calif.) **Personality test patterns of rehabilitation center alcoholics, psychiatric inpatients and normals.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 366-371.—Using the 3 groups, a test battery was administered to 180 Ss. A stepwise multiple discriminant analysis method was used to find linear combinations of variables which seemed to be superior to any single variable in separating the 3 groups. The MMPI produced

the most accurate classifications but classification accuracy was enhanced by combining variables from both tests utilized. Results are also presented for various psychiatric groups.—*E. J. Kronenberger.*

962. Stone, L. A. (U. North Dakota) **A law of clinical judgment: A psychological mechanism based on the logic of psychophysics.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 312-317.—Prognostic favorability and impairment severity scales were found to be highly related based on 2 independent groups of psychiatrist-judges. Empirically derived exponents for the relations are presented. "The suggestion was made that the power law of sensory psychophysics also may be an apt model for the study of complex conceptual and judgmental processes."—*E. J. Kronenberger.*

963. Thorne, F. C. **Psychological "twenty questions": A method for teaching diagnostic interviewing.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 331-334.—Presents psychological twenty questions (PTQ), a device to aid in diagnostic interviewing. The nature of PTQ is to establish certain facts which can be elicited only with optimum lines of questioning and narrowing down the attributes of the facts to be discovered. Rules for PTQ, case materials, and scoring methods are presented. Experience indicated that the method can be used for playing various client roles. The PTQ is intended to be used as a practicum teaching device in introductory courses in psychological diagnostic interviewing.—*E. J. Kronenberger.*

964. Torgerson, Warren S. (Johns Hopkins U.) **Multidimensional representation of similarity structures.** *Public Health Service Publication*, 1968, No. 1584, 212-220.

965. Walton, H. J., Foulds, G. A., Littmann, S. K., & Presley, A. S. (U. Edinburgh, Scotland) **Abnormal personality.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 497-510.—Psychiatrists show considerable variation in their use of diagnostic terms although they do reliably categorize patients in descriptive terms. 6 psychiatrists rated 40 patients on a list of 18 descriptive items, with item linkages allowing 4 clusters to emerge, each representing a different type of abnormal personality. Case descriptions illustrate male and female types of inhibited personalities, personality disorders, aggressive sociopathy, and inadequate sociopathy with addiction. A continuing investigation aims at the development of a psychological test with which to measure abnormal personality. (23 ref.)—*R. L. Sulzer.*

966. Watson, Riley L., Pasewark, Richard A., & Fitzgerald, Bernard J. (U. Wyoming) **Use of the Edwards Personal Preference Schedule with delinquents.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 963-965.—Attempted to determine if EPPS scores differentiate institutionalized delinquent and nondelinquent adolescents. Scores of 49 delinquent boys and 46 delinquent girls, age range 15-19 yr., were compared with scores of comparable nondelinquent groups. Delinquent boys scored significantly lower in achievement, deference, affiliation, and dominance. Delinquent females scored higher in heterosexuality and lower in endurance and deference. Incomplete description of presumed need constellations in delinquency and inconsistency in male and female results obtained with the EPPS makes questionable the use of this instrument for the stated purpose.—*Journal abstract.*

967. Weinstock, Harry I. (City Hosp. Center, Mt. Sinai Hosp. Services, Elmhurst, N.Y.) **The role of**

classification in psychoanalytic practice. *Public Health Service Publication*, 1968, No. 1584, 62-72.

968. Wilson, Paul T. (American Psychiatric Assn., Information Processing Project, Washington, D.C.) **A plan for refining the nosology of mental illness.** *Public Health Service Publication*, 1968, No. 1584, 53-61.

969. Ziv, Avner. (Tel-Aviv U., Ramat Aviv, Israel) **Children's behavior problems as viewed by teachers, psychologists, and children.** *Child Development*, 1970 (Sep), Vol. 41(3), 871-879.—30 behavior problems, based on E. K. Wickman's checklist, were ranked according to their severity by 165 8th grade boys and girls, 82 teachers, and 45 psychologists. A significant positive correlation was found between teachers' and psychologists' ranking. This result is different from that found in similar studies conducted in the United States. However, a qualitative analysis indicates that teachers still consider overt behavior problems more serious, while psychologists consider withdrawal problems to be more severe. Children ranked the problems more like the teachers than the psychologists. This is probably due to the teachers' socializing influence and the continuous interaction between teachers and students. (19 ref.)—*Journal abstract.*

BEHAVIOR DISORDER

971. Attkisson, C. Clifford. (U. Tennessee) **Suicide in San Francisco's skid row.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 149-157.—Investigated the relationships between alcoholism and suicide in San Francisco's South of Market area. Death and coroner's records were used to identify 110 male and 12 female documented suicides from 1958-1967. Data were available on 15 demographic and health-related variables for the suicide group and 5 variables for a comparison group of 18,956 skid row area residents. Cluster analyses identified 6 profile types among the suicide group: (a) prototype suicide, (b) aged and physically ill immigrant, (c) young, unmarried alcoholic, (d) alcoholic mentally disordered, (e) maritally disrupted and mentally disordered American, and (f) aged and mentally disordered immigrant. Results suggest that alcohol usage by itself does not discriminate within the suicide group, but its role is more apparent in interaction with other variables. The study also supports recent research which indicates that white males are the highest risk group for alcoholism and suicide in combination. (27 ref.)—*P. McMillan.*

972. Maitra, Amal K., Mukerji, Kamal, & Raychaudhuri, Manas. **Artistic creativity among the delinquents and the criminals: Associated perceptual style.** *Bulletin of the Council of Social & Psychological Research, Calcutta*, 1967 (Jul), No. 9, 7-10.—Administered the Welsh Figure Preference Test to 80 Ss divided into 4 equal groups: 1 of juvenile delinquents (14-18 yr. old) showing artistic talents, 1 of criminals indulging in artistic creativity, and 2 controls of nonartist normal counterparts. Data were scored on the Conformance Scale, the Revised Art Scale, and the median test was employed in testing the hypotheses. The experimental groups were characterized by nonconformity with the consensus and showed significantly higher tolerance and acceptance of ambiguity in their perception than

nonartist, normal Ss. Since this perceptual preference peculiarity is also usual with other creative artists who do not exhibit delinquent or criminal tendencies, results appear to confirm stability of this sort of distinctive perceptual activity. The available data also give credence to the developing, emerging nature of this perceptual style.—*Journal abstract.*

Drug Addiction

973. Wheeler, Lorraine & Edmonds, Carl. (Drug Referral Centre, Rushcutters Bay, New South Wales, Australia) **A profile of drug takers.** *Medical Journal of Australia*, 1969 (Aug), Vol. 2(6), 291-294.—Studied 100 drug-dependent clients who were seen at the Drug Referral Center in Sydney. Most were young adults, and the drugs taken ranged from marihuana to heroin. Data describe drug-dependent individuals who remain within the community, and who still require the help of its services.—*Journal abstract.*

Alcoholism

974. Gruzelier, J. H. & Corballis, M. C. (U. London, Birkbeck Coll., England) **Effects of instructions and drug administration on temporal resolution of paired flashes.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 115-124.—16 male alcoholics were shown pairs of light flashes separated by 0-100 msec. intervals and then judged whether there were 1 or 2 flashes. 2-flash fusion threshold was raised by administration of promazine hydrochloride and was higher for strict than for lenient instructions. Signal detection analysis showed that the drug reduced sensitivity but did not affect criterion, while instructions altered criterion placement without changing sensitivity. (23 ref.)—*Journal abstract.*

975. Hoffmann, Helmut & Abbott, David. (Minnesota State Hosp., Willmar) **Emotional self-description of alcoholic patients after treatment.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 892.—Compared 61 alcoholics just being admitted to the hospital on mood scales, Edwards Social Desirability (SD) scale, and Marlow-Crowne Social Desirability (MC-SD) scale with a 2nd group (N = 61) who received 3 wk. of treatment. It is concluded that hospitalization reduces the amount of guilt feelings and effects alcoholics to give a more socially desirable self-description (SD).—*Author abstract.*

976. Winokur, George; Reich, Theodore; Rimmer, John, & Pitts, Ferris N. (Washington U., Medical School) **Alcoholism: III. Diagnosis and familial psychiatric illness in 259 alcoholic probands.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 104-111.—Interviewed 103 female and 156 male alcoholic patients concerning their psychiatric status. Information was also obtained on family history of psychiatric illness in their 1st-degree relatives. Data indicate that (a) females became alcoholic at a later age than males; (b) primary affective disorder was diagnosed in a significant proportion of the females but not in the males; (c) personality disorder, mainly sociopathy, was found in a larger proportion of males than females; (d) morbid risks for alcoholism and affective disorder were given in all classes of 1st-degree relatives (i.e., male relatives suffer an increased risk of alcoholism and female relatives of affective disorder); (e) female alcoholics were more likely to have a family history of psychiatric disease than male;

(f) male relatives were more likely to have a psychiatric illness than female; and (g) affective disorders in relatives were usually depressive in nature and only rarely manic.—*Journal summary.*

Suicide

977. Buglass, Dorothy & McCulloch, J. W. (U. Edinburgh, Scotland) **Further suicidal behaviour: The development and validation of predictive scales.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 483-491.—Data on 511 postattempt patients were used to construct scales which discriminated between suicide attempt repeaters and nonrepeaters. The scale for men consisted of 3 items: alcoholism, alcohol at the time of attempt, and violence. The female scale included previous psychiatric treatment, drug addiction, dwelling mobility, childhood parental absence, psychopathy, and previous suicide attempt. Validation in a later year showed the female scale to be predictive while the male scale was not.—*R. L. Sulzer.*

978. Frederick, Calvin J. & Resnick, H. L. (National Inst. of Mental Health, Div. of Special Mental Health Programs, Chevy Chase, Md.) **Interventions with suicidal patients.** *Journal of Contemporary Psychotherapy*, 1970 (Win), Vol. 2(2), 103-109.—Reviews the status of screening, diagnosis, and treatment of suicidal patients. It is contended that, generally, there exists sufficient knowledge to screen and diagnose suicidal patients, while effective treatment techniques have not yet been developed. It is suggested that in devising new and innovative procedures, areas deserving further research include: (a) developing approaches to provide competent follow-up treatment, (b) involvement of "significant others" as resource persons, (c) more effective techniques of using group psychotherapy, and (d) use of the therapeutic opportunity provided by hospitalized suicidal patients for thorough clinical and biochemical study. It is further suggested that in the area of suicidal crises, volunteers could be more effectively utilized—both professionals who should feel concerned and move to act, and nonprofessionals who when properly screened and trained can provide invaluable assistance in many areas.—*M. Maney.*

979. Gobar, A. H. (Kabul U., Afghanistan) **Suicide in Afghanistan.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 493-496.—This strongly Islamic country shows a suicide rate of 1/4 case/100,000 population per year, the lowest rate reported in the world. Hanging, shooting, and stabbing are the chief methods, contrasting with domestic gas poisoning which is more common in some industrial nations. In addition to religion, factors possibly holding down the suicide rate are the small number of elderly persons and the fact that the old do not face neglect, abandonment, and social isolation but benefit from the strong family ties and general social structure.—*R. L. Sulzer.*

980. Kreitman, Norman; Smith, Peter, & Tan, Eng-Seong. (U. Edinburgh, Scotland) **Attempted suicide as language: An empirical study.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 465-473.—Proposes that suicide attempts should occur in socially linked groups of individuals more frequently than in the general population, the particular group at risk being that section of the community in which self-aggression is recognized as conveying certain information. Survey of close associates of 181 attempted suicides produced 17

positives, overrepresenting those under 35 yr. of age, especially females and those using drugs in the suicidal attempt. These findings are compatible with the hypothesis of cultural transmission of the predisposition.—R. L. Sulzer.

981. Lee, Mercile J. (Hartford Seminary Foundation, Conn.) **A search for meaning: A study of threatened, attempted, and completed suicides among selected college students.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5224-5225.

982. Lukianowicz, N. (33 N. Circular Rd., Belfast, Ireland) **Attempted suicide in children.** *Acta Psychiatrica Scandinavica*, 1968, Vol. 44(4), 415-435.—Reviews the psychiatric literature on attempted suicide in children and suggests a classification based on the degree of the determination to commit suicide. The problem is illustrated by 10 case studies of attempted, threatened, or contemplated suicide among 120 children referred for various reasons to 2 child guidance clinics. The etiology, symptomatology, and psychodynamics of attempted suicide in children are discussed. Conclusions are drawn regarding the treatment and the prevention of conditions leading to suicidal attempts in children. (46 ref.)—*Journal summary*.

983. Motto, Jerome A. (U. California, Medical School, San Francisco) **Newspaper influence on suicide: A controlled study.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 143-148.—Develops a previously reported approach to the contention that newspaper reports of suicidal behavior precipitate suicide among suggestible readers. The suicide rate during a 268-day period of complete cessation of newspaper publishing in a major metropolitan area was compared with the mean rate for the same calendar period of the prior 4 yr. and of the subsequent yr. When combined age and sex specific groups were compared, it was seen that the newspaper blackout was accompanied by a significant lowering of the suicide rate in the female population, especially in age groups under 35. Implications raised by these findings are discussed, with special concern for the role of the press in influencing the developing value system of receptive readers.—*Journal summary*.

984. Philip, Alistair E. (U. Edinburgh, Scotland) **Traits, attitudes and symptoms in a group of attempted suicides.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 475-482.—Examined 100 attempted suicides in order to provide a detailed description of those citizens of Edinburgh, Scotland, admitted to the hospital after suicidal behavior. $\frac{1}{2}$ showed diagnosis of character disorder, excess hostility was evident, excess anxiety, some introversion, and less conscientiousness than normals or neurotics was found. While there does not seem to be a unique suicidal personality, often there is poor personality integration, impulsiveness, and poor interpersonal relations. (32 ref.)—R. L. Sulzer.

985. Stanley, E. James & Barter, James T. (U. Colorado, Medical Center, Denver) **Adolescent suicidal behavior.** *American Journal of Orthopsychiatry*, 1970 (Jan), Vol. 40(1), 87-96.—Presented a controlled followup study of 38 hospitalized adolescent suicide-attempters. In the prehospitalization phase there was no difference between the experimental group (suicide attempters) and the control group (psychiatrically ill but no suicidal behavior) in the incidence of parent loss, amount of family conflict, degree of social isolation, or

frequency of clear crises. Experimental Ss did seem to be significantly different in regard to the age of parent loss and the type of parental discord. After discharge, experimental Ss did not differ from control Ss in their adjustment. The subgroup which attempted suicide before but not after hospitalization also was not significantly different in their behavior or environmental conditions from controls. During the postdischarge phase, only Ss who attempted suicide both before and after hospitalization were clearly distinguishable from controls and the nonrepeat group. The repeat attempters had less adequate social lives, did less well in school, and were less likely to be living with a parent or parents. (16 ref.)—*Journal summary*.

986. Yufit, Robert I., Benzie, Bonnie; Fonte, Mary E., & Fawcett, Jan A. (Illinois State Psychiatric Inst., Chicago) **Suicide potential and time perspective.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 158-163.—Developed a semiprojective questionnaire to assess suicidal potential from the viewpoint of time perspective. It was hypothesized that the suicide-prone individual (a) "will evidence less involvement in the future than the nonsuicidal person," and (b) "is more likely to be involved in the past than in the present." The Time Questionnaire was administered to 2 clinical groups (70 patients with either primary depressive syndrome or schizophrenics with depressive features); and 2 nonclinical groups (35 mental health staff members and 57 students). Data were evaluated to test for the possibly confusing effects of clinical factors, including age, psychomotor retardation, diagnosis, and intensity of depression. Results confirm both hypotheses, and the questionnaire "appears to have differentiated the clinical and comparison groups." Further studies are needed, however, to indicate the extent to which the questionnaire can evaluate suicidal potential apart from depression.—P. McMillan.

Crime

987. Dods, Linda Y. (U. Connecticut) **Pro-social and anti-social conformity in incarcerated females.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5235-5236.

988. Górski, Janusz. **Problem efektywności kar dyscyplinarnych stosowanych względem wybitnie zdemoralizowanych więźniów młodocianych.** [The effectiveness of disciplinary sanctions applied toward very demoralized young adult delinquents.] *Przegląd Penitencjarny*, 1968, Vol. 6(1), 83-87.—Based on research with 154 incarcerated delinquents, it is concluded that disciplinary sanctions have a positive effect on the reeducation process when the prisoner has been given a job of some value or esteem which he fears losing. (French & Russian summaries)—C. R. Vestal.

989. Ketterling, Marvin E. (Milwaukee Technical Coll.) **Rehabilitating women in jail.** *Journal of Rehabilitation*, 1970 (May), Vol. 36(3), 36-38, 56.—Discusses a 4-mo program of intense education and counseling given females in a county jail. The effect of the program based on its impact on recidivism, county aid status, and employment was essentially statistically insignificant although it is reported that the experimental group (those receiving the training and counseling) did not reflect the 16% in increased arrest rate for women in Milwaukee County for 1963 compared to 1962. It is suggested that alcoholic inmates should be removed from the jail setting

and placed in a rehabilitative treatment center. The use of a psychiatric social worker with the remaining inmates is also urged.—*M. A. Seidenfeld.*

990. Morawski, Jacek. *O potrzebie badania gwary przestępczej.* [On the need for studies concerning the slang of the criminal population.] *Przegląd Penitencjarny*, 1968, Vol. 6(1), 72-82.—Traces new orientations of research on criminal slang, and advances several hypotheses. Results and uses of the 4 basic research orientations (etymologic, lexicologic, pragmatic, and semantic) are explained. Slang is regarded not only as a product of the criminal group, but as a great influence on the formation of attitudes and opinions of criminals, especially juvenile delinquents. This research on slang and other cultural elements of the prison milieu can further analysis of prisoners' behavior and predictions of their reactions under different stimuli. (French & Russian summaries) (32 ref.)—*C. R. Vestal.*

991. Snortum, J. R., Hannum, T. E., & Mills, D. H. (Claremont Men's Coll.) *The relationship of self-concept and parent image to rule violations in a women's prison.* *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 284-287.—54 inmates at a woman's reformatory were rated by psychologists on frequency of rule violations. These ratings were correlated with MMPI scores and with the inmate's ratings of her mother, father, self, and ideal self. Rule violations were found to be positively correlated with the Pd and Ma scales and with self-ratings on scales measuring destructive potential, asocial narcissism, and emotional discomfort. There was no significant relationship between rule violations and ideal-self ratings. A negative concept of the mother figure, not a negative view of the father, was related to chronic resistance to prison rules.—*E. J. Kronenberger.*

992. Wierzbicki, Piotr. *Poglady psychologów penitencjarnych na problem indywidualizacji: Badania ankietowe.* [Opinions of prison psychologists on individualization.] *Przegląd Penitencjarny*, 1968, Vol. 6(1), 60-71.—Results of a study of prison psychologists show the need to expand the methods of individual treatment by giving individual psychotherapy and more educational and professional consultations to young adults, inmates with psychic deviations, and demoralized recidivists. It is suggested that prisons increase psychological staffs to allow for more individualization, and that principles of individualization be expanded to all prison personnel. (French & Russian summaries)—*C. R. Vestal.*

A. *Pervaya vsesoyuznaya konferentsiya po psikhologicheskomu izucheniyu trudnovospituemykh detei i podrostkov-pravonarushitelei.* [First All-Union Conference on the Psychological Study of Children with Behavior Problems and of Juvenile Delinquents.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 181-185.—Presents the proceedings of a 1969 conference held in Moscow, in which some 100 individuals participated and 43 presentations were made.—*L. Zusne.*

995. Cartwright, Desmond S., Howard, Kenneth I., & Reuterman, Nicholas A. (U. Colorado) *Multivariate*

analysis of gang delinquency: II. Structural and dynamic properties of gangs. *Multivariate Behavioral Research*, 1970 (Jul), Vol. 5(3), 303-323.—Develops measures of structural and dynamic properties of gangs: size, differentiation, primary pattern strength, competing pattern strength, and territorial dispersion; and cohesiveness, uniformity of attitude, and felt effectiveness. Except for size and dispersion, all measures are derived from applications of cluster and factor analysis. Evidence of construct validity is provided. The measurements are then related to mean scores on 5 factors of behavior for 16 gangs. It is found that: (a) less differentiated gangs engage in more property offenses, (b) gangs with stronger primary pattern engage in more conflict and stable sex behaviors, and (c) gangs with greater cohesion engage in less property offenses and conflict behaviors. A distinction between behavioral and attitudinal cohesiveness is discussed. (16 ref.)—*Journal abstract.*

(Eds.) *Gefährdung und Resozialisierung Jugendlicher.* [Factors endangering youth and the resocialization of youth.] Vienna, Austria: Europa, 1968. 191 p.—Presents a collection of papers on measures for dealing with juvenile delinquency, and the mental health of juvenile delinquents. The papers are derived from a seminar held at the University of Vienna.—*I. D. London.*

1002. Tritan, Andrew R. (United States International U., San Diego, Calif.) *The psychology of rebellion: A study in human behavior.* *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5230.

Homosexuality & Sexual Deviation

1003. Bak, Robert C. **The phallic woman: The ubiquitous fantasy in perversions.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 15-36.—Discusses the influence exerted by early traumata on the causation and development of deviant sexual behavior, and presents numerous case histories. "The clinical case material reconfirms the finding that multiple perverse manifestations frequently occur in the same individual. They can be present concurrently or manifest themselves separately in different life phases. The clinical syndromes showed a preponderance of obsessional symptoms, impulsive character structures, and borderline personalities. . . . Castration anxiety and its phase specificity to the phallic phase play a central role in perversion." Among the causes of increased sensitivity to castration anxiety are emphasized the "disturbances in the early mother-child relationship which increase separation anxiety and clinging and may actually threaten survival." The oedipal conflict, constitutional predisposition, developmental factors, visual and tactile overstimulation, and the connection between perversion and musical talent are also discussed. Finally, acting out is examined as it is inherent in the perverse character. (33 ref.)—*B. A. Stanton.*

1004. Bentler, P. M., Sherman, R. W., & Prince, C. (U. California, Los Angeles) **Personality characteristics of male transvestites.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 287-291.—Tested 25 male transvestites using the Holtzman Inkblot Test. General adult and student norms were used as a basis for determining the deviation of the observed mean in the transvestite sample. The transvestite Ss indicated a high level of general intellectual response, used form rather than color, and had a relatively high body preoccupation, and pathological thought processes. The general level of perceptual differentiation was similar to that seen in the normative data.—*E. J. Kronenberger.*

1005. Greenacre, Phyllis. **Perversions: General considerations regarding their genetic and dynamic background.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 47-62.—Traces the formation of fetishes through each stage of psychosexual development and discusses fetishistic performance. The "importance of and variations in the phallic phase with its intimate relationship with the oedipus complex . . . are discussed as they give insight into the "complexities of infantile organization which already exists as the child enters this phase." The vicissitudes of pregenital development are considered to aid in understanding penis envy and the fear of castration. It is further noted that traumas play an important role in case of fetishism, transvestism, and related perversion. The role of aggression in perversions is also examined. (31 ref.)—*B. A. Stanton.*

1006. Kahn, M. & Masud, R. **Role of the "collated internal object" in perversion-formations.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 555-565.—Confusion in analytic theorizing on perversions centers around the necessity of the presence of an external object, the unconscious organized fantasy system in the pervert, and a real situation where the 2 can become reality. Perverse sexual events are an acting-out of an intrapsychic situation in which the collated internal objects play a central role. If the pervert acts out his intrapsychic situation alone through masturbatory activities only, danger is present and may lead to

death as a way of achieving orgasm. If the bias is against acting-out, the treatment of the perversion can bog down. (28 ref.)—*J. Chyatte.*

1007. Morgenthaler, Fritz. Panel on "Disturbances of male and female identity as met with in psychoanalytic practice." *International Journal of Psycho-Analysis*, 1970 (Apr), Vol. 51(2), 251-254.—Disturbances of sexual identity result from a disharmony between ego and drive development which proceed at different speeds. This is a narcissistic disorder. By the age of 1 yr. boys, by coordinating anatomical and visual stimuli, are predisposed to problem solving and abstracting. Girls tolerate visceral-genital sensations at that time and are predisposed to personal relationships and imitation. Feelings of sexual identity oscillate in homosexuals.—*J. Chyatte.*

1008. Newman, Lawrence E. (U. California, Medical School, Los Angeles) **Transsexualism in adolescence: Problems in evaluation and treatment.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 112-121.—Reviews definitional, diagnostic, and psychotherapeutic treatment problems for the transsexual adolescent patient. The transsexual, who has profound cross-gender aspirations, experiences an identity crisis in adolescence caused by "fast developing but unwanted pubertal changes," family and society pressures against his cross-gender desires, and his own "unhappiness with his assigned gender role." It is stressed that a treatment plan must be worked out and alternative diagnoses ruled out (i.e., transvestism, effeminate homosexuality, or biological intersexuality). It is recommended that an experimental trial of at least 1 yr. in the new gender role be successfully accomplished before sex reassignment surgery is considered. (21 ref.)—*P. McMillan.*

MENTAL DISORDER

1009. Baldwin, J. A. (U. Aberdeen Scotland) **Psychiatric illness from birth to maturity: An epidemiological study.** *Acta Psychiatrica Scandinavica*, 1968, Vol. 44(4), 313-333.—Reports a pilot study of all new referrals of children and adolescents to psychiatric services in an area with a population of 480,000 over a 2-yr period. Data were retrieved from standard psychiatric case register records and used to obtain referral rates specific for sex and age which were related to urban/rural dwelling, marital status, social class, referral agent, type of service 1st entered, and diagnosis. Results show that: (a) male rates were higher than female in childhood and remained stable in adolescence; (b) female rates were low in childhood and rose steeply in adolescence; (c) rates were lower in country than in city patients but of similar pattern; (d) rates for lower social class city males were high; (e) rates for city schools were higher than country schools associated with a city child guidance clinic; (f) rates for behavior disorders remained stable or fell with increasing age; and (g) rates for neuroses increased from age 15, particularly in females. Results are discussed in relation to previous studies and social, psychological, clinical, and artifactual hypotheses. The need for more comprehensive record-linking studies across administrative, legal, and professional boundaries is stressed. (27 ref.)—*Journal summary.*

1010. Birchnell, John. (Graylingwell Hosp., Chichester, England) **Depression in relation to early and recent parent death.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 299-306.—Groups of depressed

and nondepressed patients matched on age were drawn from a sample of 500 admissions to a Scottish hospital. Incidence of both early parent death and recent parent death was higher in a severely depressed subgroup of hospitalized depressives. An excess of mother deaths appeared responsible. (19 ref.)—*R. L. Sulzer.*

1011. **Birchnell, John.** (Graylingwell Hosp., Chichester, England) **Early parent death and mental illness.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 281-288.—After age matching, the incidence of parent death before age 10 was significantly higher in a sample of 500 admissions to a Scottish psychiatric hospital than in a sample from a general practice. Apparently, the most marked effects were in the earliest age span, for loss by daughters, for loss of fathers, and for early loss of mothers.—*R. L. Sulzer.*

1012. **Birchnell, John.** (Graylingwell Hosp., Chichester, England) **Recent parent death and mental illness.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 289-297.—Compared a sample of 500 admissions to a Scottish hospital with a similar sample size from a local general practice. Higher psychiatric 1st admission rates in patients who had recently suffered parent death support the hypothesis that the years following parental bereavement represent a period of adjustment and relative instability. Internal psychological adjustment to the loss may be as important as the external adjustment to altered family circumstances.—*R. L. Sulzer.*

1013. **Birchnell, John.** (Graylingwell Hosp., Chichester, England) **The relationship between attempted suicide, depression and parent death.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 307-313.—Attempted suicide appeared more often with severe depression, early parent death, or illegitimacy in 104 Scottish patients matched to controls.—*R. L. Sulzer.*

1014. **Bolt, Jean M.** (Southern General Hosp., Glasgow, Scotland) **Huntington's chorea in the west of Scotland.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 259-270.—The minimum estimate of prevalence is 5/100,000. Examination of 124 cases and information on another 594 allows discussion of factors affecting referral and survival, plus summary of the commoner clinical features and abnormal patterns of social behavior. For prediction of cases it is important to recognize that headache and backache occur often at an early stage. Psychotic and neurotic breakdown, especially in women, and development of neurological signs without full recovery are seen relatively early. Mild neurological signs such as slight ataxia or an uneven gait may be present for 20 yr. before the full picture. A national registration system of affected families would aid diagnosis and positive advice. (28 ref.)—*R. L. Sulzer.*

1015. **Crookes, T. G. & Hutt, S. J.** (St. John's Hosp., Aylesbury, England) **Perception of hidden figures by neurotic and schizophrenic patients.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 335-336.—Attempted to confirm the lowered capacity of schizophrenics to see hidden figures. Ss were 30 schizophrenics and 30 neurotics. All Ss were administered the Gottschaldt Figures Test, the Eysenck Personality Inventory, and the Vocabulary subtest of the WAIS. Results were not significant.—*M. Maney.*

1016. **Dewhurst, Kenneth; Oliver, J. E., & McKnight, A. L.** (Littlemore Hosp., Oxford, England) **Socio-psychiatric consequences of Huntington's disease.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 255-258.—Study of 102 patients shows a high incidence

of psychiatric, sexual, and social features of Huntington's disease which antedate the florid picture seen in mental hospitals. There are diagnostic, preventive, and eugenic implications to these findings on the early stages of the illness. The disturbed environment during the years before final hospitalization makes victims of the younger members of the families, whether or not they carry the bad gene.—*R. L. Sulzer.*

1017. **Gruenewald, Doris.** (Michael Reese Hosp., Inst. for Psychosomatic & Psychiatric Research & Training, Chicago, Ill.) **A psychologist's view of the borderline syndrome.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 180-184.—Reports results of recent follow-up psychological testing of 10 Ss out of an original group of 51 patients hospitalized between 1961 and 1963, and diagnosed as showing the borderline syndrome. Ss had been part of a study by R. R. Grinker, B. Werble, and R. C. Drye leading to the identification of the borderline syndrome. The assessment battery consisted of 6 standard tests and an unpublished activity scale. The testing "supports the diagnosis in all essential points and corroborates the characteristics of the subgroups established by Grinker et al for the syndrome."—*P. McMillan.*

1018. **Lamont, John N.** (U. Washington) **Resistance to influence in depressives.** *Dissertation Abstracts International*, 1971 (May), Vol. 30(11-B), 5240-5241.

1019. **Maddocks, P. D.** (St. Thomas' Hosp., London, England) **A five year follow-up of untreated psychopaths.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 511-515.—On follow-up 10 of 59 psychopaths had settled down, while 10 were dead or lost. The others were mostly disabled with alcoholism or chronic hypochondria. Although the conviction rate falls with increasing age, 3 of 5 failed to adjust suggesting the need for treatment in addition to maturation.—*R. L. Sulzer.*

1020. **Murray, M. D., Page, J., Stotland, E., & Dietze, Doris.** (U. Washington) **Success on varied tasks as an influence on sense of competence.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 296-298.—72 male psychiatric patients, after completing a number of psychological tests, were administered a recognition recall test, a block-counting test, a logical consistency test, and mazes. 1/2 of the Ss were told that they would be working on only 1 kind of problem and the other 1/2 told they would be working on 3 different kinds of problems. The predicted effects of the task variable were slight and not sustained past the 1st trial on the mazes. Some interaction results for intelligence were noted and are discussed in relation to a significant negative correlation between the Phillips Prognostic Rating Scale and the Shipley scale.—*E. J. Kronenberger.*

1021. **Oliver, J. E.** (Burdorpe Hosp., Wroughton, England) **Huntington's chorea in Northamptonshire.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 241-253.—Compared the prevalence of this disease for the years 1954-1955 and 1967-1968. Prevalence figures show this clear-cut and obviously hereditary madness is being perpetuated, while data spanning 5-8 generations show the devastation wrought by the illness not only to afflicted members of the families but to their relatives and dependents. Eugenic advice is often lacking due to failure to diagnose, tardy diagnosis, misdiagnosis, family dispersal, inaccurate family histories, poor community records, and the failure of many persons in affected families to tell the truth to prospective mates.—*R. L. Sulzer.*

1022. **Rothstein, W. & Boblitt, W. E.** (William S. Hall

Psychiatric Inst., Columbus, S.C.) **Expressed fears of psychiatric inpatients.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 277-279.—Investigated the relative frequency with which 50 male and 50 female psychiatric inpatients responded to the various items on the Wolpe and Lange Fear Survey Schedule (FSS). A table of ranked frequency of expressed fears is presented. Females obtained higher fear scores than older people.—*E. J. Kronenberger.*

1023. **Spiegel, D.** (Veterans Administration Center, Brentwood Hosp., Los Angeles, Calif.) **Psychological health-sickness and the perception of self and others.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 274-276.—17 patients were ranked on a dimension of psychological "health-sickness" by 14 patients and professional treatment team members. Intercorrelations among the rank assignments made by various staff and patient groups are presented. A high order of agreement was noted although some differences did exist in self-judgments. The chief psychiatrist had a low order of agreement with the ward psychiatrist. Results indicate that a person with severe psychiatric disturbance can make congruent judgment about the behavior and thinking of others.—*E. J. Kronenberger.*

1024. **Washburne, Chandler.** (Fresno State Coll.) **The role theory of mental illness.** *Acta Symbolica*, 1970 (Spr), Vol. 1(1), 47-52.—Presents a "general outline for the role theory of mental illness. The implications of this theory for specific forms of illness, and for therapy have only been suggested, and some references provided that detail specific aspects." Role-taking is an exercise in language and communication. The key to the treatment of mental illness lies in what is the meaning of his behavior to the individual. Failures in role-taking are basic to much mental illness. A role theory of mental illness demands a role treatment of the illness.—*M. Cynamon.*

Neurosis & Emotional Disorder

1025. **Artiss, Kenneth L.** (10401 Old Georgetown Rd., Bethesda, Md.) **An administrative behavior pattern of certain obsessional characters.** *Contemporary Psychoanalysis*, 1970 (Spr), Vol. 6(2), 93-106.—As psychiatric consultant the author collected data on 12 male MDs, psychologists, and social workers mostly in psychiatric residence who "had violent confrontations leading to their being 'fired' or threatened and 2 having suicided under such stress." In relation to their "bosses" they all discovered what the boss wanted from them, gave evidence that they would provide it, and "somehow, mysteriously" failed to deliver. Of 7 spouses observed and/or interviewed "all were joyless females... appeared careworn." In the institution, "the entire working staff tends to become a transfixed audience" for the S while his "boss is made the villain and isolated."—*L. W. Brandt.*

1026. **Balint, Michael.** **Trauma and object relationship.** *International Journal of Psycho-Analysis*, 1969 (Oct), Vol. 50(4), 429-435.—The last major addition to trauma theory was in 1920 in Freud's *Beyond the Pleasure Principle*. Trauma is defined as "an external event causing severe psychical upheaval with lasting consequences which need sustained therapeutic efforts to understand and remedy." Theoretically, the etiology of the neuroses starts with an external sexual trauma for which the individual is unprepared or an internal trauma

produced by the individual's fantasy which is not classifiable as unexpected. Observation indicates that traumas usually occur in early childhood, are connected with a person intimately related to the S, and are usually his oedipal objects or their substitutes (nurses, tutors, etc.). Trauma is theorized as 3-phased; immature child is dependent on adult and trusts him; adult does something unexpectedly exciting (for the child); and child re-approaches adult to continue the exciting game and is ignored or refused.—*J. Chyatte.*

1027. **Brierley, Harry.** (General Hosp., Newcastle upon Tyne, England) **The habituation of forearm muscle blood flow in phobic subjects.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1969 (Feb), Vol. 32(1), 15-20.—Forearm muscle blood flow is higher in 10 agoraphobic patients than in 10 normal controls while relaxing. It is hypothesized that this constant difference represents "free floating anxiety" level. Habituation over a substantial period of time is demonstrated and the suggestion is made that regression constants are better indices of blood flow than empirical values, i.e., the mean of 3 lowest measurements. A lack of mean response to a stressor was found among Ss in contrast to a large rapidly habituating response shown by controls. In view of the lack of stress responsiveness of Ss no new light is thrown on the positive feedback hypothesis. Comparison of the stressed blood flow responses of normals and Ss is strikingly similar to the pattern of psychogalvanic reflex responses. No simple application of physiological measurements to the assessment of anxiety in therapeutic situations is likely. (22 ref.)—*Journal summary.*

1028. **Flach, Frederic F. & Faragalla, Farouk F.** (Payne Whitney Psychiatric Clinic, New York, N.Y.) **The effects of imipramine and electric convulsive therapy on the excretion of various minerals in depressed patients.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 437-438.—Ss were 14 depressed patients. Results indicate "that ECT or imipramine therapy were associated with shifts in electrolyte excretion which varied among the patients studied. The common denominator in these shifts was the observable decrease in urinary calcium which was preceded or accompanied by a change in 1 or other of the measured electrolytes such as phosphate, magnesium, sodium and potassium."—*M. Maney.*

1029. **Grinker, Roy R. & Nunnally, Jum C.** (Michael Reese Hosp., Chicago, Ill.) **The phenomena of depressions.** *Public Health Service Publication*, 1968, No. 1584, 249-261.

1030. **Hay, G. G.** (Bolton District General Hosp., Farnworth, England) **Dysmorphophobia.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 399-406.—Studied 17 patients complaining about the appearance of some part of their bodies. 5 were found to be psychotic, and as a group they were severely disturbed. Body image complaint appears to be nonspecific as a symptom but a complaint prone to occur in patients of a particular personality type (sensitive and/or insecure) (17 ref.)—*R. L. Sulzer.*

1031. **Holder, Alex.** **Theoretical and clinical notes on the interaction of some relevant variables in the production of neurotic disturbances.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 63-85.—Identifies and defines the presence of 3 variables in neurotic disturbances: (a) assessment of the impact of trauma, (b) sexual and aggressive drives, and (c) influences on the

development and structuralization of the ego. 2 case histories are presented to demonstrate the interaction of these variables and the continuous variable changes which occur as the result of maturational processes. (15 ref.)—*B. A. Stanton.*

1032. Kiloh, L. G. (U. New South Wales, Kensington, Australia) **Depressive illness.** *British Medical Journal*, 1968 (Dec), Vol. 4(5634), 813-815.—Differentiates between endogenous and neurotic depression on the basis of onset and appropriateness. Criterion for the determination of abnormal depression are discussed, emphasizing the etiology and duration. Drug, ECS, and psychotherapy are discussed in relation to the type of depression.

1033. Kohut, H. **The psychoanalytic treatment of narcissistic personality disorders: Outline of a systematic approach.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 86-113.—Presents a "classification of the transference-like structures mobilized during the analysis of narcissistic personalities..." 2 transferences are examined: (a) the idealizing transference, the therapeutic activation of the idealized parent image; and (b) the mirror transference, the therapeutic activation of the grandiose self. The process of the working through phase of the analysis and other clinical problems in both transferences are considered as well as the reactions of the analyst.—*B. A. Stanton.*

1034. Lebovici, S. (3 Ave. du Président Wilson, Paris, France) **Clinical and technical notes concerning psychoanalysis with regard to phobias affecting men.** *International Journal of Psycho-Analysis*, 1970 (Jan), Vol. 51(1), 23-31.—Examines the difficulties met by the psychoanalyst in the cure of male anxiety hysteria. It is felt to be rarer than in women, but is at least as serious as its more severe form observed in women. Whereas infantile phobias occur with equal frequency in boys and girls, male anxiety hysteria stems from true phobic neurosis with severe inhibition areas manifesting themselves from childhood onwards. It is of prime importance to understand what happens to aggressivity when it is displaced onto the phobia-creating object, at both the metapsychological and the technical levels. In the case of women, the counteractiveness of aggressive impulse representatives is expressed by passivity, an accepted feminine trait. In men, fear of castration is accompanied by secondary and differentiated post-oedipal identifications. Therefore the effort of elaboration on the function of the superego is extremely inadequate in men suffering from phobias. In such cases, it is necessary to concentrate on the femininity and passivity, on the components of repressed anal eroticism through which these tendencies could be expressed. Unfortunately, femininity and passivity are culturally prohibited in men. Nevertheless, the integration of such tendencies represents a technical objective of the greatest importance, which is difficult to achieve and makes the psychoanalytical cure of these cases particularly arduous.—*Journal summary.*

1035. Stössel, S. & Lăzărescu, M. **Nevroză și activitate.** [Neurosis and activity.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Jan), Vol. 13(1), 45-54.—Discusses the latest findings in the psychopathology of neurosis, presents several ways in which the neurotic episode is induced, and analyzes the role of activity and work recovery. It is concluded that the term psychogeny is inadequate. (French, German, & Russian summaries) (17 ref.)—*English summary.*

1036. Thomson, L. G. (Whitecroft Hosp., Newport, Isle of Wight, England) **On the genesis of affective illness: A pair of discordant twins.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 323-325.—Both twins experienced similar stressful events (husband's infidelity), but the one smaller at birth, the 1st born, who was raised with a more protective attitude of the mother, developed depression while her sister showed an adaptive response. The well twin was preferred by the father, was the leader in youth, and the livelier throughout.—*R. L. Sulzer.*

Psychosis

1037. ———. **Depression revealed.** *Nature*, 1968 (Sep), Vol. 219(5160), 1213.—Describes studies which demonstrated alterations in ion membrane transport and saliva composition in manic depressives. Saliva was collected in an undefined population of depressed and manic patients and controls. Flow pH, and Na concentrations were measured twice for each S. Results reveal: (a) slightly lower saliva flow rates in patients, (b) less Na and bicarbonate reabsorption in patients, (c) mean pH values of 7.27 and 7.38 for patients, and (d) mean pH values of 6.39 and 6.72 for controls. When the patients with manic and depressed states recovered, however, saliva pH returned to normal. Possible explanations included disturbed adrenocortical metabolism and altered membrane permeability.—*B. A. Stanton.*

1038. Basson, Charles A. (U. Cincinnati) **Affective content and contextual constraint in recall by paranoid, non-paranoid, and non-psychiatric patients.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5231.

1039. Campanini, Tito; Catalano, Alberto; de Risio, Carlo, & Mardighian, Giacomo. (U. Parma. Clinica delle Malattie Nervose e Mentali, Italy) **Vanilmandelicaciduria in the different clinical phases of manic depressive psychosis.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 435-436.—Ss were 7 39-58 yr. old untreated inpatient females. Ss were observed from 4-10 mo. during the natural evolution of manic-depressive psychosis. It is concluded that: "(a) there is an interrelationship between urinary excretion levels of vanilmandelic acid [VMA] and clinical state in the natural course of manic-depressive psychosis (on condition that anxiety is not present) in contrast to the output during normal intervals, (b) the highest VMA excretion rates occur in the manic phases; less elevated VMA values were found in mixed states, (c) VMA urinary excretion rates in depressive phases are within the fluctuation limits of VMA as found in our patients when they were clinically normal."—*M. Maney.*

1040. Dissanayake, S. A. & Leiber, D. M. (Bexley Hosp., Dartford Heath, England) **Hypopituitarism with paranoid psychosis: A description of two cases.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1969 (Jun), Vol. 32(3), 233-235.—Describes 2 cases of hypopituitarism with paranoid psychosis without memory disturbance or mental confusion. In 1 S the psychosis had lasted for 16 yr. and persisted, in spite of treatment with substitute hormones and phenothiazines which restored his physical health. There was a complete remission in the other S with similar treatment whose symptoms had lasted for 2 yr.—*Journal summary.*

1041. Dvorkina, N. Ya. (Provincial Psychiatric Hosp., Orenburg, USSR) **O patomorfoze infektsionnykh**

psikhozov. [On the pathomorphosis of infectious psychoses.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 94-97.—Analyzed 411 cases of infectious psychoses over a 22-yr period (1946-1967). Data indicate (a) a change in infectious psychoses from acute to protracted and organic forms, (b) a gradual relative diminution of the number of psychoses with pictures of clouded consciousness, and (c) the growth of psychoses whose onset was marked by endogenic, transitory psychopathological syndromes. The pathomorphosis of infectious psychoses was closely tied to the pathomorphosis of infectious diseases—suggesting that they are the product of the same causes which lead, in the 1 case, to a change in the interrelationships between the infection and the macroorganism and, in the other case, to a change, for that very reason, in the mechanisms underlying the development of the psychopathological process. The evolution of infectious psychoses demonstrates the “absence of an essential difference between the picture of exo- and endogenic psychoses.”—*I. D. London.*

1042. **Glatzel, J.** (Friedrich-Wilhelm U., Nerven-klinik, W. Germany) **Über beziehungen zwischen streckenprognose und verlaufs typologie bei der zyklomye.** [The relationship between extended prognosis and progressive typology with cyclothymia.] *Acta Psychiatrica Scandinavica*, 1968, Vol. 44(4), 354-375.—Describes phases and frequency of cyclothymia in relation to classic prognosis based on age, frequency of attacks, and frequency of manic stages of manic depressive psychosis. In addition, the problem of residual syndromes in cyclothymic progression is discussed. (3 p. ref.)—*B. A. Stanton.*

1044. **Retterstøl, Nils.** (U. Oslo, Psychiatric Inst., Norway) **Paranoid psychoses with hypochondriac delusions as the main delusion: A personal follow-up investigation.** *Acta Psychiatrica Scandinavica*, 1968, Vol. 44(4), 334-353.—Presents both a historical outline of views on psychoses with hypochondriac delusions and a 5-yr follow-up study of 10 male and 5 female patients (4% of all psychiatric patients admitted over 2 periods) who presented hypochondriac delusions as the main delusion. The hospital diagnoses were reactive psychosis in 7 cases, psychosis e genere incerto in 7, and schizophrenia in 1. That the delusions were of hypochondriac nature could be explained as a symbolic reaction to a provoking conflict situation, or on the basis of: earlier life history, previous somatic illness, or previous psychic traumas. In some cases, especially schizophrenics, it was hard to explain why a hypochondriac rather than another delusion should have developed. The clinical course was favorable in 7 Ss: those with reactive psychosis, without and with relapse; and unfavorable in 8 Ss: those with chronic reactive psychosis, and schizophrenia. 7 Ss were in full social function, and the hypochondriac delusion had vanished in 13 cases. It is concluded that, in psychoses with hypochondriac delusion, the prognosis is dependent on the basic type of disease more than on type of hypochondriac delusion. (38 ref.)—*Journal summary.*

1045. **Vartanyan, M. E.** **Problemy prichinnosti v psikiatrii (geneticheskii i ékologicheskii aspekt).** [Problems of causality in psychiatry (genetic and ecological aspect).] *Zhurnal Nevropatologii i Psikiatrii*,

1970 (Jan), Vol. 70(1), 3-11.—Discusses causal problems in the various psychoses from a strictly deterministic viewpoint. Whatever the mechanisms may be which mediate the influence of social factors on the emergence and spread of mental diseases, “it is important to emphasize that all such influences cannot make themselves felt outside the biological (physiological) processes of the organism of the stricken person.”—*I. D. London.*

Schizophrenia

1046. **Abenson, M. H.** (Kaplan Hosp., Rehovoth, Israel) **EEGs in chronic schizophrenia.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 421-425.—Comparison of 210 schizophrenic recordings with 100 normal controls indicates that schizophrenia involves a brain disorder generalized or localized in the temporal regions. Subgroups and particular symptoms did not relate to specific EEG patterns except for an excess of choppy records in the catatonics. The most abnormalities of record were in the hebephrenic group. Doing pneumoencephalograms on the most deteriorated patients would be a way to test the idea of generalized brain disorder in schizophrenia. (32 ref.)—*R. L. Sulzer.*

1047. **Birley, J. L. & Brown, G. W.** (Maudsley Hosp., London, England) **Crises and life changes preceding the onset or relapse of acute schizophrenia: Clinical aspects.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 327-333.—Background study of 50 patients leads to the conclusion that both life events and reducing or stopping phenothiazines contribute as precipitants of acute schizophrenia. Symptomatology seems largely unrelated to its precipitants. (23 ref.)—*R. L. Sulzer.*

1048. **Enăchescu, C.** **Contribuții la studiul psihopatologic al neoformațiilor expresive la bolnavii schizofrenici.** [Contributions to the psychopathologic study of expressive neoformations in schizophrenic patients.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Jan), Vol. 13(1), 63-80.—Shows that psychopathologic elements are characteristic of schizophrenia and affect the form and significance of the expressive symbols. Neoformations are due to the phenomena of automatism, autism, the delirious hallucinatory syndrome, the eccentricity of these patients, and reflect the new structure of their personality. Transformation of the expressive symbols parallels the psychotic transformation of the patient's personality. 3 stages are distinguished to which the following 3 forms correspond: paraformations, neoformations, deformations. They appear secondary to transformation of the symbolization function in schizophrenia. (French, German, & Russian summaries) (52 ref.)—*English summary.*

1049. **Frost, J. B.** (U. Liverpool, England) **Paraphrenia and paranoid schizophrenia.** *Psychiatria Clinica*, 1969, Vol. 2(3), 129-138.—Compares 8 paraphrenics and 8 paranoid schizophrenics on the basis of personality, family relationships, physical health, and social adaptation. Differences in the frequency of physical illness and character traits were noted with aloof independence prominent in the paraphrenics and angry resentful attitudes common in paranoid schizophrenics. Paraphrenics were noted to be admitted to hospitals at later average ages, to have shorter hospital stays, and to have fewer readmissions. It is suggested that their drive to try to understand their delusions is a factor which should be included in planning the treatment

program, as it may be utilized in supportive psychotherapy.—*Journal summary.*

1050. Garnezy, Norman. (U. Minnesota, Center for Personality Research) **Process and reactive schizophrenia: Some conceptions and issues.** *Public Health Service Publication*, 1968, No. 1584, 419-466.

1051. Hare, E. H. & Price, J. S. (Maudsley Hosp., London, England) **Birth rank in schizophrenia: With a consideration of the bias due to changes in birth-rate.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 409-420.—In a large scale study, an excess of schizophrenics was found in the later birth ranks for sibships of 2-4. Examination of the literature suggests that the widely discrepant conclusions may have resulted from changes in the reproductive habits of the population, a factor allowed for in this study. (28 ref.)—*R. L. Sulzer.*

1052. Higgins, Jerry. (U. California, Santa Barbara) **The schizophrenogenic mother revisited.** *British Journal of Psychiatric Social Work*, 1968 (Feb), Vol. 9(4), 205-208.—Argues that much of the confusion surrounding the concept of the schizophrenogenic mother is attributable to the fact that different types of schizophrenics come from different types of family constellations. Evidence supporting this assertion is reviewed, and the differential development of the child contingent upon the type of family organization is described.—*Journal summary.*

1053. Jansson, Bengt. (U. Göteborg, Sahlgren's Hosp., Sweden) **The prognostic significance of various types of hallucinations in young people.** *Acta Psychiatrica Scandinavica*, 1968, Vol. 44(4), 401-409.—Investigated the connection between prognosis and type, duration, frequency, form, and contents of hallucinosis. 84 hallucinosis cases out of 293 young people with suspected schizophrenia symptoms served as Ss. Results show that: (a) there is no significant relation between prognosis and hallucinosis in any particular sense organ; (b) hallucinosis with a diagnosis of schizophrenia shows a worse prognosis than under other conditions, while hallucinosis with affective or organic disorders show a significantly better prognosis when taken together; (c) there is no connection between premorbid personality and prognosis for hallucinosis of any particular type; and (d) neither imperative hallucinosis nor those of the Gedanken Lautwerden type always imply a serious prognosis, however, for those of a frightening or hypnagogic nature, the prognosis is considerably more favorable.—*M. Maney.*

1054. Johnson, J. E. & Oziel, L. J. (Xavier U., Cincinnati, O.) **An item analysis of the Raven Colored Progressive Matrices test for paranoid and non-paranoid schizophrenic patients.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 357-359.—An item analysis was made of the results of 200 mental hospital patients on the Raven Coloured Progressive Matrices (CPM). Paranoid schizophrenic Ss did not differ from nonparanoid schizophrenic Ss in their performance on the test, the CPM may lack the discriminative power to be considered a valid measure of intellectual reasoning in schizophrenic Ss for this population.—*E. J. Kronenberger.*

1055. Jortner, S. (Mid-Nassau Community Guidance Center, Hicksville, N.Y.) **Overinclusion responses to WAIS Similarities are suggestive of schizophrenia.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 346-348.—Analyzed the overinclusion responses on the

WAIS Similarities subtest for 56 schizophrenic and 56 nonschizophrenic Ss. Only 8 of the 112 Ss gave 1 or more overinclusion responses and all 8 were schizophrenic Ss. It is suggested that overinclusion seems to be a factor in schizophrenic distortions of thought, logic, language, and perception.—*E. J. Kronenberger.*

1056. Katz, Martin M. (National Inst. of Mental Health, Psychopharmacology Research Branch, Chevy Chase, Md.) **A phenomenological typology of schizophrenia.** *Public Health Service Publication*, 1968, No. 1584, 300-322.

1057. Kaufmann, L. & Muller, C. (U. Lausanne, Clinique psychiatrique, Lausanne, Switzerland) **Über Familienforschung und Therapie bei Schizophrenen.** [Family investigation and therapy with schizophrenics.] *Nervenarzt*, 1969 (Jul), Vol. 40(7), 302-308.. Presents case material to illustrate communication disturbances in a family having several schizophrenic members. Therapeutic contact with the family in a psychiatric clinic is described. Disturbances in sex roles between parents and children and communication disturbances are given primary consideration. (30 ref.)—*B. A. Stanton.*

1058. Lindinger, Helge C. **Familienumwelt und Prognose der Schizophrenie: Die Bedeutung verschiedener Familiensituationen für den Verlauf.** [Family environment and prognosis of schizophrenia: The significance of various family situations for outcome.] Bern, Switzerland: Hans Huber, 1968, 246 p.

1059. MacSweeney, David A. (West Park Hosp., Epsom, England) **A report on a pair of male monozygotic twins discordant for schizophrenia.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 315-322.—In probably the 1st report of monozygotic twins given thyroid during the neonatal period because of failure to make normal progress, it is shown that the twin becoming psychotic was lighter at birth, the 2nd born, had a more abnormal EEG, and had skull X-ray differences. At the time of the study, Ss were 25 yr. old. Since twin studies suggest that postnatal environment may be less important in schizophrenia than some say, it may be presumed that the lighter infant had a less generous blood supply in utero, that the hour between births may have caused some anoxic brain damage, and that adverse effects of thyroid extract given soon after birth might be causal. (17 ref.)—*R. L. Sulzer.*

1060. Mattsson, Nils B. & Gerard, Ralph W. (George Washington U., Biometric Lab.) **Typology of schizophrenia based on multidisciplinary observational vectors.** *Public Health Service Publication*, 1968, No. 1584, 507-534.

1061. Owens, John A. (U. Houston) **The GSR component of the orienting response in relation to duration of schizophrenia and phenothiazine level in outpatients compared to normals.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5241-5242.

1062. Parhon-Ştefănescu, Constanţa; Neicu, Valentina; Vujdea, Ileana, & Strassman, Elena. **Cercetări clinico-anamnestice în schizofrenie.** [Clinical-anamnestic investigations in schizophrenia.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Jan), Vol. 13(1), 39-44.—Studied 50 patients separated into 3 main groups: (a) Ss with psychopathologic, heredofamilial antecedents, (b) Ss with harmful congenital factors, and (c) Ss without heredofamilial antecedents or congenital factors. It is concluded that the clinico-anamnestic study often gives indications concerning the differential diagnosis

between true schizophrenia and the schizophreni-form syndromes. Comparative investigations on the pathologic physiology of the different groups are suggested. (French, German, & Russian summaries)—*English summary*.

1063. Rosenman, Martin F. (U. South Carolina) **Impression formation in schizophrenics and normals.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5243.

1064. Sonninen, A., Siltala, P., & Siirala, M. (Helsinki, Finland) **On the fundamental prerequisites of language development: An autistic child experienced by a phoniatric team.** *Journal of Communication Disorders*, 1970 (Jun), Vol. 3(1), 1-27.—Presents the case history of an autistic boy focusing on the intra- and interpersonal prerequisites of language development in a child where "psychological resistance to communication and anxious withdrawal from interpersonal relations are particularly salient." It is emphasized that fundamental prerequisites do not primarily concern only the functioning ability of the peripheral and central speech mechanism, but also include the establishment of real contact with the child's inner world, however elementary the mode of communication may be. It is suggested that ideal conditions for therapy with severe autistic children include: (a) effective cooperation between the speech therapist and the psychotherapist, (b) a psychotherapeutic team in speech clinics, (c) a testing program for early screening of all high risk cases, (d) supportive therapy for parents, and (e) continuous communication between treatment personnel and authorities.—*M. Maney*.

1065. Strenski, Antoinette; Payson, J. M., Muzekari, L. H., & Bohr, R. H. (Philadelphia State Hosp., Pa.) **Preferences and dislikes for color among chronic schizophrenics.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 310-311.—60 chronic schizophrenic Ss and 60 control Ss made color preferences and color dislikes. Results were rated as being in sharp contrast with previous findings. There were no significant differences between groups for most-liked color. The color black was chosen by 27% of the schizophrenic Ss and by 5% of the normal group as a liked color and 12% and 37%, respectively, as the disliked color. It is suggested that among chronic schizophrenic Ss culturally defined norms of color choice may be weakened as a result of institutionalization.—*E. J. Kronenberger*.

Schizophrenia Treatment

1066. Brown, Gaylia D. (Purdue U.) **A comparison of the effects of "intrusive" and "permissive" group treatments of hospitalized chronic schizophrenic patients.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5233.

1067. Karon, Bertram P. & Vendenbos, Gary R. (Michigan State U.) **Experience, medication, and the effectiveness of psychotherapy with schizophrenics.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 427-428.—May and Tuma suggested that only medication, not psychotherapy, made a difference in the outcome with schizophrenics. Unlike most projects that employ psychiatric hospital residents as therapists, at Michigan State University patients were treated by an experienced psychiatrist and an experienced psychologist. Patients treated by the experienced therapists improved more than controls tested after treatment by 1

of 5 experienced therapists. Differences in theoretical rationale, technique, and medication made less difference than experience of the therapists.—*R. L. Sulzer*.

1068. Needham, R. F. & Blignault, W. J. (Parramatta Psychiatric Center, New South Wales, Australia) **A comparison of an acridan derivative (Smith Kline and French 14336) and trifluoperazine in the treatment of chronic schizophrenia.** *Medical Journal of Australia*, 1969 (Sep), Vol. 2(11), 550-553.—Over a period of 28 wk., 27 pairs of hospitalized male patients matched for age, duration of chronic schizophrenia and total morbidity were studied. Assessment was made by means of the Nurses' Observation Scale for Inpatient Evaluation, a Brief Psychiatric Rating Scale, and global evaluation. Findings suggest that, at the dosage levels employed, Smith Klein and French (SKF) 14336 was neither superior nor inferior to trifluoperazine in controlling behavior or reducing psychopathology. Side effects were similar, except that in the group receiving SKF 14336 a polymorphous light eruption occurred in 10 cases.—*Journal abstract*.

PSYCHOSOMATIC DISORDER

1069. Goodwin, Donald W. (Washington U., Medical School) **Psychiatry and the mysterious medical complaint.** *JAMA: Journal of the American Medical Association*, 1969 (Sep), Vol. 209(12), 1884-1888.—When patients complain of pain or some other physical symptom, and no physical cause can be found, it is not enough to suggest that the symptom is functional or psychological. The physician should rule out 3 psychiatric disorders in which unexplained physical symptoms often dominate the clinical picture. These are hysteria, anxiety neurosis, and depression. Each is a definite syndrome with specific diagnostic criteria and a well-documented natural history. Hysteria and anxiety neurosis often can be managed as successfully by an internist or general practitioner as by a psychiatrist. Depression more often justifies a psychiatric referral. "Functional" symptoms which cannot be attributed to 1 of these syndromes often warrant further search for an organic cause. (15 ref.)—*Journal abstract*.

CASE HISTORY

1070. Biemond, A. (U. Amsterdam, Holland) **Wernicke's encephalopathy and Korsakow's syndrome.** *Psychiatria Clinica*, 1969, Vol. 2(3), 146-166.—Reports the case history and neuropathological substrate of a woman who 5½ yr. prior to her death developed Wernicke's disease, and who subsequently showed both permanent psychical disturbances and ataxia. Lesions proved to be present only in the mammillary bodies and the cortex of the cerebellar vermis. The symptomatology of Wernicke's disease is discussed. (21 ref.)—*Journal summary*.

1071. Blumenau, M. (Powick Hosp., Worcestershire, England) **The caseworker's dilemma: A case study.** *British Journal of Psychiatric Social Work*, 1968 (Spr), Vol. 9(3), 130-132.—Presents the views of a social worker undertaking casework with an elderly alcoholic patient. In wishing to also work with the patient's wife, the social worker saw herself as increasingly "engaged in preventive work" and "interested in broader concerns than simply the individual as a patient."

1072. Burlingham, Dorothy & Goldberger, Alice. **The re-education of a retarded blind child.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 369-390.—Presents a detailed case history of a backward, withdrawn, blind child with multiple handicaps and subjected to lack of stimulation, pain, and frustration in her early childhood. A lengthy treatment record and progress report of normal development are provided. A discussion by Alice B. Colonna follows.—*B. A. Stanton.*
1073. Burvill, P. W., Jackson, J. M., & Smith, W. G. (Royal Perth Hosp., Western Australia) **Psychiatric symptoms due to vitamin B₁₂ deficiency without anaemia.** *Medical Journal of Australia*, 1969 (Aug), Vol. 2(8), 388-390.—Attention is drawn to the protean and readily treatable psychiatric manifestations which may be associated with vitamin B₁₂ deficiency in the absence of the fully developed syndrome of Addisonian pernicious anemia. An illustrative case history is presented.—*Journal abstract.*
1074. Colonna, Alice B. **A blind child goes to the hospital.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 391-422.—Presents a comprehensive chronological case history of a blind child who was subjected to repeated hospitalizations between the ages of 14 mo. and 8 yr. The additional difficulties encountered by blind children during hospitalizations include the foremost difficulty of mastering new surroundings. Describes how a child therapist provided additional support and reassurance and succeeded in preventing more trauma before and during the time of the child's last hospitalization.—*B. A. Stanton.*
1075. Elisch, Paula. **Nonverbal, extraverbal, and autistic verbal communication in the treatment of a child tiqueur.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 423-437.—Discusses nonverbal communication in a child with a tic neurosis, increased motor latency, coprolalia, and unintelligible speech. Drawings are presented and interpreted to illustrate the child's severe psychological disturbances. How nonverbal, extraverbal, and autistic verbal communication may be used constructively as therapeutic tools is demonstrated.—*B. A. Stanton.*
1076. Eşanu, C., Semen-Negrea, Ecaterina, & Chivu, Viorica. (Academy of the Socialist Republic of Romania, Inst. of Medicine & Pharmacy, Bucharest) **Paroxysmal hypertension associated with endocrinological and psychical troubles (pheochromocytoma-like syndrome).** *Revue Roumaine d'Endocrinologie*, 1968, Vol. 5(1), 67-72.—Studies the case of a 41-yr-old female presenting severe organic and psychical troubles. The problems raised by the differential diagnosis between a pheochromocytoma and a pseudopheochromocytoma are discussed. The clinical examination and the laboratory tests led to a diagnosis of hysteroid psychosis associated with high arterial blood pressure. A treatment was applied, but as the suspicion of a pheochromocytoma was not positively refuted, follow-up is required.—*Journal abstract.*
1077. Fraser, W. I. & MacGillivray, R. C. (Lennox Castle, Glasgow, Scotland) **A case of cervico-oculo-acoustic dysplasia: The syndrome of Wildervanck.** *Journal of Mental Subnormality*, 1970 (Jun), Vol. 16(1), 29-32.—Investigates the case of a 28-yr-old female with cervico-oculo-acoustic dysplasia making special reference to inner ear pathology and dwarfism, and discusses causal hypotheses. Its relative frequency in the Scottish population is stressed and a delineation of the condition is attempted, placing it in the First Arch Series of syndromes.—*Journal summary.*
1078. Glass, George S. & Bowers, Malcolm B. (Connecticut Mental Health Center, New Haven) **Chronic psychosis associated with long-term psychotomimetic drug abuse.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 97-103.—Presents case histories of 4 20-22 yr. old white males, hospitalized with chronic psychotic syndromes, who had allegedly used large quantities of psychotomimetic substances (LSD or similar compounds) for extended periods of time prior to hospitalization. Although no acute psychotic episode could be identified, psychotic behavior developed gradually over a period of time in which psychotomimetic drug use was associated with avoidance of certain maturational stresses. Several common clinical issues are identified in this group (i.e., massive avoidance of conflictful life situations, stressful interpersonal encounters, and painful affect). In these Ss, prolonged use of psychotomimetic substances, rather than precipitating an acute psychotic reaction, fostered a gradual retreat from reality and affective pain, leading to a chronic, egosyntonic psychotic syndrome which was relatively resistant to inpatient treatments. (21 ref.)—*Journal summary.*
1079. Gloning, I., Gloning, K., Jellinger, K., & Quatember, R. (U. Vienna, Neurological Inst., Austria) **A case of "prosopagnosia" with necropsy findings.** *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 199-204.—At necropsy, bilateral old encephalomalacias were found in the lingual and fusiform gyri. Neuropsychological examination revealed deficits in discriminating and identifying faces as well as complex visual patterns which cannot be readily verbalized. (French & German summaries)—*Journal abstract.*
1080. Grecu, C., Asgian, V., & Csiky, C. **Considerații asupra sindromului Korsakov în 4 cazuri clinice.** [Considerations on the Korsakov syndrome in four clinical cases.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Sep), Vol. 13(5), 469-475.
1081. Greger, J. & Bock, R. **Paranoide Reaktion einer Schwerhörigen nach gehörverbessernder Operation.** [Paranoid reaction of a deaf person following an operation to improve hearing.] *Psychiatria Clinica*, 1969, Vol. 2(3), 139-145.—Reports a case of a 60-yr-old deaf woman, who in spite of her severe deafness and the resulting difficulties in communication, had remained largely unimpaired as far as her interpersonal relationships were concerned. Only after an operation which suddenly restored her hearing was there a decompensation of her relationships with a transient paranoid response to her environment. This reaction would suggest that not only a sensory-social isolation, but equally a sudden cessation of a long existing but compensated acoustic communicative deficiency, can bring about a psychogenic paranoid-like reaction.—*English summary.*
1082. Holland, Norman N. Freud and H. D. **International Journal of Psycho-Analysis**, 1969 (Jul), Vol. 50(3), 309-315.—Hilda Doolittle, a poetess describes her 100 hr. with Freud in 1933 in her 1944 book *Tribute to Freud*. It is a series of free associations whose merit lies in the detailed description of Freud's office and method of analysis. Miss Doolittle had had a nervous breakdown and had intense hallucinations or mystical visions subsequently. Freud was intensely curious about the creative artist and used this analysis to educate both

himself and his patient in psychoanalytic method. His method was unusual psychoanalytic behavior but perhaps he was so active in an attempt to ward off a psychotic episode in the patient.—*J. Chyatte.*

1083. Ionesco, B., et al. (Academy of the Socialist Republic of Romania, Inst. of Endocrinology, Bucharest) **Syndrom de Turner a virilisation et avec une seule gonade malignisée.** [Turner's syndrome with virilization and unilateral gonad malignization.] *Revue Roumaine d'Endocrinologie*, 1968, Vol. 5(2), 155-160.—Presents a patient with several malformations specific to Turner's syndrome, also having virilization phenomena: hypertrophy of the clitoris and male pilosity with hirsute character. The internal genital organs are feminine but atrophic. On the left side there is a streak-gonad, on the right side a progonadal tissue undergoing a malignant transformation. The etiopathogenic hypotheses of the syndrome are discussed.—*English summary.*

1084. Kaldegg, A. (International Rorschach Society, London, England) **Friedel: A clinical study of culture pattern, personality and pathology.** *British Journal of Projective Psychology & Personality Study*, 1968 (Jun), Vol. 13(1), 5-10.—Presents the case of a 30-yr-old German woman who became emotionally disturbed while in nurses training in England. A diagnostic evaluation based on the Progressive Matrices, parts of the Wechsler, Lennep's 4-Picture-Test, and the Rorschach are presented. Following transfer to another hospital, the patient's symptoms of paranoid thinking became more prominent, even though she continued nurses training without any complaints from others. Her mental condition worsened while on leave in Germany. It is concluded that her defenses in her own country were less effective than those she was able to mobilize in a less familiar environment.—*P. McMillan.*

1085. Kolouch, Fred T. (U. Utah, Medical School) **Hypnosis in living systems theory: A living systems autopsy in a polysurgical, polymedical, polysychiatric patient addicted to Talwin.** *American Journal of Clinical Hypnosis*, 1970 (Jul), Vol. 13(1), 22-34.—Presents the case of a 50-yr-old married female patient who responded well to combined medical-psychiatric treatment, including hypnotherapy. The total medical situation, illnesses, diagnoses, and treatments are viewed in the model of living systems theory. The position of hypnosis in living systems is discussed.—*M. V. Kline.*

1086. Lush, Dora. **Progress of a child with atypical development.** *Journal of Child Psychotherapy*, 1968 (Dec), Vol. 2(2), 64-73.—A 3-yr-old girl referred for lack of speech, affectionless attitude to people, many phobias, and obsessional rituals and mannerisms was tentatively diagnosed as autistic. The patient's speech improved while waiting for treatment and reasons are suggested for this. Twice-weekly analytically based psychotherapy brought relief of her symptoms and changed her attitude to people and she became responsive and affectionate. Description is given in detail of 2 therapy sessions with discussion of material and theoretical concepts. Reasons for the patient's atypical development are suggested as are reasons for her recovery and ability to use the treatment.—*Author abstract.*

1087. Maenchen, Anna. **Object cathexis in a borderline twin.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 438-455.—The lack of gratification, the failure to anticipate gratification, and the lack of frustration interfere with the development of object relations and

with the evolution of normal personality. The result is archaic anxiety. The 1st recognition of the mother is more difficult for twins, and so is the "recognition" of the individual child for the mother of twins. Each individual twin has a different environment. If a twin symbiosis occurs, however, it plays a decisive role in the origin of a defect in object cathexis. The twin symbiosis drains or replaces entirely the mother-child symbiosis. Illustrative cases are presented. (49 ref.)—*Journal summary.*

1088. Michaelis, R. & Stegen, J. (U. Kiel, Psychiatrische und Nervenlinik, W. Germany) **Zykloides Drei-Phasen-Syndrom nach kontusioneller Hirnschädigung.** [Cycloid-three-phase-syndrome following cerebral contusion.] *Psychiatria Clinica*, 1969, Vol. 2(4), 193-203.—Describes a psychosis which occurred following a cerebral contusion and was characterized by 3 distinct phases: (a) loss of liveliness, depression, and sleep disturbance; (b) excessive need for sleep and polyphagia; and (c) a manifold increase in liveliness. This condition can be differentiated from cyclothymia by the hypersomnic middle phase. (26 ref.)—*English summary.*

1089. Nolan, G. & Hackman, Ann. (Purdysburn Hosp., Belfast, Ireland) **Cleidocranial dysostosis: Psychological observation of two cases.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 543-544.—This congenital condition with a defect in bone formation typically shows dwarfism, a large head with small face, and a depressed nose. Comparison with a normal sibling shows a marked deficit in general intelligence as well.—*R. L. Sulzer.*

1090. Perna, Dorris. (Cedars-Sinai Medical Center, Los Angeles, Calif.) **Psychogenic effect of marihuana.** *JAMA: Journal of the American Medical Association*, 1969 (Aug), Vol. 209(7), 1085-1086.—Presents a case of a 23-yr-old male to illustrate an association between the use of marihuana and psychosis. Prior to the S's 1st experience with marihuana, a history revealed emotional problems with no evidence of psychosis. The S's 1st experience with marihuana was unpleasant, and his 2nd experience resulted in a psychotic reaction. It is suggested that marihuana could have a psychogenic effect in individuals having healthy premorbid personalities.—*B. A. Stanton.*

1091. Popova, L. M. (Inst. of Neurology, Moscow, USSR) **O mnogoletnei iskusstvennoi ventilatsii pri paralichakh dykhatel'nykh myshts posle perenesenogo ostrogo poliomiellita.** [On artificial ventilation extending over many years in paralyses of the respiratory muscles following an attack of acute poliomyelitis.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 12-18.—Presents a detailed case report and analysis of the homeostatic reactions over a 10-yr period. Data are included on the reaction of the respiratory center to adequate stimuli (hypercapnic gas mixtures). Chronic hypocapnia led to heightened excitability of the respiratory center in response to normal values of partial pressure of CO₂ in the arterial blood.—*I. D. London.*

1092. Poznanski, Z. & Pawlik, M. (Province Neurological Outpatient Clinic, Cracow, Poland) **Epileptic seizures provoked by television.** *Polish Medical Journal*, 1969, Vol. 8(2), 471-473.—Describes epileptic seizures developing in a 29-yr-old female patient during photic stimulation incurred while adjusting a TV set. Routine investigations failed to reveal any abnormalities and diagnosis was established only after EEG exami-

nation showing scant alpha and beta activity at rest.—*Journal abstract.*

1093. **Prabhakaran, N.** (Jawaharlal Inst. of Post-graduate Medical Education & Research, Pondicherry, India) **A case of Gilles de la Tourette's syndrome with some observations on aetiology and treatment.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 539-541.—Presents the case report of a 15-yr-old Muslim boy. On the assumption that the condition may be the product of organic brain damage acted on by psychological stress, suggested treatment includes a drug which acts on the basal ganglia, trifluoperazine, together with psychotherapeutic methods which alleviate social or psychological stress.—*R. L. Sulzer.*

1094. **Price, Joseph R. & Horne, Betty M.** (Vanguard School, Lake Wales, Fla.) **Family history indicating hereditary factors in hydrocephalus.** *Mental Retardation*, 1968 (Oct), Vol. 6(5), 40-42.—Traces the occurrence of 11 cases of hydrocephalus in 3 generations of 1 family. The father of this family also sired another family in which there were no known cases of this disorder. All 11 cases were children of female descendants of the original couple. Similar family histories are cited from the literature.—*Journal abstract.*

1095. **Radford, Patricia.** **A neurotic conflict.** *Journal of Child Psychotherapy*, 1968 (Dec), Vol. 2(2), 18-30.—Attempts to illustrate an understanding of neurotic conflict through the description of a 6-yr period of analytic work with a 12-yr-old boy. Using the Freudian theory that neurotic conflict is an intrapsychic one, the analysis attempted to undo the excessive defensive distortions of the boy's ego with its equally distorted image of its id and superego, which restricted development and inhibited drive activities. Masculine active drives were forbidden by a sadistic superego obtaining its authority from identification with a real and a fantasied powerful, hostile, "castrating" mother. Recognition and working-through of the myth of the omnipotence of his superego and his id freed his ego to mediate more realistically with his environment. (15 ref.)—*Author abstract.*

1096. **Rolla, Edgardo H.** **Symbol formation in phobias.** *Contemporary Psychoanalysis*, 1970 (Spr), Vol. 6(2), 160-168.—A case report illustrates the theoretical discussion of introjection and projection in phobias.—*L. W. Brandt.*

1097. **Rosenfeld, Sara.** **Choice of symptom: Notes on a case of retention.** *Journal of Child Psychotherapy*, 1968 (Dec), Vol. 2(2), 38-49.—Discusses specific features contributing to the symptom-formation in terms of the interaction between the psychopathology of 2 mothers and their 2 children: (a) interferences with the function of mothering with reference to the mothers' unconscious fantasies and reactivation of unconscious conflicts in response to phase-adequate instinctual manifestations in their children; (b) the emotional relevance of the patients' own body products as seen in the renewed investment of faces with object cathexis as a reaction to disappointment in the object; (c) timing of habit training at a transitional period from the oral to the anal phase; and (d) some comments on management.—*Author abstract.*

1098. **Searles, Harold F.** **A case of borderline thought disorder.** *International Journal of Psychoanalysis*, 1969 (Oct), Vol. 50(4), 655-664.—Presents a case report in which repression of oral activities (sucking and biting impulses) hindered flow of speech and thought.

1099. **Zaslow, Stephen L.** (24 N. Washington St., Pt. Washington, N.Y.) **The threat from below.** *Contemporary Psychoanalysis*, 1970 (Spr), Vol. 6(2), 169-179.—Presents the case of a 39-mo-old girl who suddenly wanted to sit on the potty instead of going to bed. It was finally discovered that the refusal to go to bed occurred for the 1st time following the 1st independent urination in the potty by the 21-mo-old sister. A fantasy by the elder sister was discovered of growing "littler" as the younger sister grew up. This is discussed in terms of object constancy and the development of concepts of time and of conservation.—*L. W. Brandt.*

MENTAL HEALTH & REHABILITATION

1100. **Allison, Kenneth & Dunn, Dennis J.** (Stout State U.) **A selected bibliography on work evaluation.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 40-41.

1101. **Barton, Everett H.** (U. San Francisco) **Vocational evaluation and work adjustment: Vocational development companions.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 35-37.—Discusses the interrelationship which exists between vocational evaluation and work adjustment. Combined, these 2 processes are viewed as leading to vocational development and those who administer the combined program are seen as "vocational development specialists."—*M. A. Seidenfeld.*

1102. **Deehy, Patrick T.** (Princeton U.) **The halfway house in the correctional sequence: A case-study of a transitional residence for inmates of a state reformatory.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5077.

1103. **Grimberg, Moises.** (Talbot Habilitation Community, Westboro State Hosp., Mass.) **The surrogate society: A new approach to rehabilitation.** *Journal of Rehabilitation*, 1970 (May), Vol. 36(3), 34-35.—Describes the efforts of a rehabilitation service to establish a society in microcosm in order to better prepare selected patients to meet the demands of competitive society and for vocational adjustment in their community. The results attained appear to be quite successful and give evidence that an inhospitable competitive society is more likely to be effective in returning the individual to effective life both within the institution and upon discharge to the outside world.—*M. A. Seidenfeld.*

1104. **Hoffman, Paul R.** (Stout State U.) **An overview of work evaluation.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 16-18.—Presents an overview of the historical background, definitions, concepts, and work trends related to work evaluation as it is applied to the rehabilitation of the disabled and disadvantaged.—*M. A. Seidenfeld.*

1105. **Leshner, Saul S.** (Jewish Employment & Vocational Service, Philadelphia, Pa.) **The relationship of work evaluation to work adjustment training.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 32-34.—Work evaluation and work adjustment are viewed as interacting processes which deal with the same behavioral variables but are perceived and administered in a different fashion by the counselor and impact differently on the client. Both are seen as counseling tools valuable in bringing the client within attainment of his potential for employment.—*M. A. Seidenfeld.*

1106. **Micalizzi, Francesco.** (Ed.) **Aggressivita e sanita mentale: Atti del IV Congresso regionale siciliano di igiene mentale.** [Aggression and mental health: Presented at the Fourth Regional Sicilian

Congress of Mental Hygiene.] Milan, Italy: Editrice Vita e Pensiero, 1969. xxii, 592 p.

1107. Miskimins, R. W., Green, H. J., Oetting, E. R., & Cole, C. W. (Colorado State U.) **Selection factors relating to placement of psychiatric patients for vocational rehabilitation.** *Manpower & Applied Psychology*, 1968 (Win), Vol. 2(2), 60-65.—Results provide considerable support for the major hypothesis of the study: not placed psychiatric patients are more disabled, i.e., less able to function "normally," than patients selected for placement by vocational rehabilitation counselors.—P. L. Crawford.

1108. Neff, Walter S. (New York U.) **Vocational assessment: Theory and models.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 27-29.—Briefly discusses some major problems in psychological assessment with particular attention focused on the effect of behavioral variability as influenced by the particular situation with which the individual is interacting. Also noted is the indirect and roundabout nature of behavioral assessment as well as other factors which tend to make prediction of vocational outcomes somewhat precarious. It is concluded that we are now approaching the time when considerable improvement can be made in assessment by extending the assessment process into actual industrial situations with the increased possibility of accurate situational analysis.—M. A. Seidenfeld.

1109. Overs, Robert P. (Curative Workshop of Milwaukee, Wis.) **Vocational evaluation: Research and implications.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 18-21.—Reviews the research on vocational evaluation as it is specifically related to the field of rehabilitation. It is pointed out that the principal research effort in this field has been focused on obtaining scientific support for the development and use of predictive devices or for measurement of the effect of the measurement of the total work evaluation process. Many of the difficulties that are attendant upon the use of such procedures are discussed. It is indicated that standardized tests of manual dexterity predict as well as, or even better than, job samples and may be administered in a much shorter time span and with greater savings to both the client and the staff in time and effort. Also discussed are some of the weaknesses in these procedures, and suggested are other approaches such as measuring the total work evaluation process through the use of total assessment scales that may prove more effective.—M. A. Seidenfeld.

1110. Pruitt, Walter A. (Stout State U.) **Basic assumptions underlying work sample theory.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 24-26.—Discusses the theoretical basis of the work sample theory and the primary assumption that individuals who may not be capable of adequate evaluation on psychological tests may be more successfully evaluated when given the opportunity to demonstrate on samples of simulated work.—M. A. Seidenfeld.

1111. Reiff, Robert & Scribner, Sylvia. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Rehabilitation and community mental health employability and disability issues.** *Journal of Rehabilitation*, 1970 (May), Vol. 36(3), 11-15.—Reviews some traditional concepts in assessing the employability of the mentally ill worker and some innovative approaches to developing working arrangements utilizing the mental health professionals to assist the mentally ill worker gain admittance to the labor market.—M. A. Seidenfeld.

1112. Roberts, Charles L. (International Assn. of

Rehabilitation Facilities, Washington, D.C.) **Definitions, objectives, and goals in work evaluation.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 12-15.—Discusses some of the confusion that exists between such terms as "prevocational evaluation," "vocational evaluation," and "work evaluation" and many other closely related words or phrases that are or have been concerned with means for appraising the potential capacity of an individual to perform certain activities considered predictive of work performance in actual employment. Coupled with this problem is the matter of how well the potential worker with a physical or mental disability will be able to adjust in the working situation and the goals that are considered to be essential elements in determining the success or failure in vocational rehabilitation. Emphasis is placed on the importance of these goals in the establishment of rehabilitation facilities that are capable of leading to proper evaluation of the rehabilitant.—M. A. Seidenfeld.

1113. Rosenberg, Bernard. (Inst. for the Crippled & Disabled, New York, N.Y.) **The professional in vocational evaluation.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 30-32.

1114. Sankovsky, Ray. (U. Pittsburgh) **Toward a common understanding of vocational evaluation.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 10-12.—Considers the meaning of the concept "vocational evaluation" as somewhat nebulous. An attempt is made to provide clarification by (a) more adequately establishing criteria and vocational goals, (b) collecting information regarding vocational potential, (c) decision-making on vocational objectives and predicting outcomes, and (d) determining the effectiveness of the evaluation process by feedback obtained through follow-up. Each of these steps is described.—M. A. Seidenfeld.

1115. Sindberg, Ronald M., Roberts, Allyn F., & Pfeifer, Edward J. (Central Wisconsin Colony & Training School, Madison) **The usefulness of psychological evaluations to vocational rehabilitation counselors: A preliminary study.** *Rehabilitation Literature*, 1968 (Oct), Vol. 29(10), 290-294.—Measured the usefulness of psychological reports to vocational rehabilitation counselors in an objective fashion. 2 factors in usefulness, the extent to which counselors followed the psychologist's specific recommendations and the extent to which the specific predictions were confirmed, were studied in a sample of 35 psychological reports. It was found that over 1/2 of the recommendations were rated as definitely followed or followed to a large extent, and nearly all of the predictions tested were rated as confirmed to some extent. However, nearly 1/2 of all of the specific predictions were rated as not tested at time of follow-up. It is concluded that psychological reports are generally helpful and useful to rehabilitation counselors, in terms of the usage of their recommendations and their predictiveness, although in a substantial number of cases the failure to test psychological predictions raises a question as to their value in that respect. (27 ref.)—*Journal abstract.*

1116. Spergel, Philip. (Moss Rehabilitation Hosp., Philadelphia, Pa.) **Vocational evaluation: Research and implications for maximizing human potential.** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 21-24.—Notes the dearth of acceptable research in vocational evaluation, and takes cognizance of the problem areas and suggests some methods of resolving them.—M. A. Seidenfeld.

1117. Stotsky, Bernard A., Goldin, George J., & Margolin, Reuben J. (Northeastern U.) **The physician and rehabilitation: A survey of attitudes.** *Rehabilitation Literature*, 1968 (Oct), Vol. 29(10), 295-299.—Surveyed physicians regarding their knowledge of rehabilitation services and investigated their attitudes with respect to various facets of rehabilitation. Questionnaires were sent to 1500 randomly selected physicians, 150 psychiatrists, and 30 physiatrists. A total of 535 questionnaires were returned, a 32% response rate. Findings showed that information concerning the existence of state rehabilitation agencies was lacking in over 1/2 of the sample. Where physicians were aware of the rehabilitation agency, many gaps existed in their information concerning its function, structure, and operation. Generally speaking, physicians were positive in their attitudes toward rehabilitation but did not relate to the institutionalized structures through which it is made available to patients. There were significant differences among the branches of medicine represented in the sample. Psychiatrists differed sharply from physiatrists and general practitioners for most responses. They related closely to the rehabilitation process, being especially concerned with the social and emotional aspects of rehabilitation. As might be expected, general practitioners and physiatrists were most concerned with the physical aspects of rehabilitation. (15 ref.)—*Journal summary*.

1118. Walker, Robert A. (Minneapolis Rehabilitation Center, Minn.) **A future for vocational evaluation?** *Journal of Rehabilitation*, 1970 (Jan), Vol. 36(1), 38-39.

1119. Wright, Beatrice A. & Shontz, Franklin C. (California State Coll., Dominguez Hills) **Process and tasks in hoping.** *Rehabilitation Literature*, 1968 (Nov), Vol. 29(11), 322-333.—Delineated 7 types of hope structures, 2 applying to children and 5 to adults. The main feature distinguishing child and adult hope structures is the absence of reality surveillance in the former. Whereas children's hopes are equivalent to desires, both desires and reality considerations support adult hopes. Adult hope structures varied according to the manner in which the person copes with the problem of uncertainty regarding the realizability of his hopes. Reality surveillance provides support for existing hopes and for hopes that eventually may be substituted. The process of hoping involves 4 cognitive-effective tasks: (a) reality surveillance, (b) encouragement, (c) worrying, and (d) mourning. The proper balance among these 4 tasks can best be effected when parents become actively involved with the child's rehabilitation and share questions and concerns with specialists and other parents in an atmosphere of mutual respect.—*Journal summary*.

1120. Zimmerman, Joseph; Stuckey, Thomas E., Garlick, Betsy, & Miller, Maurine. (Indiana U., Medical School, Inst. of Psychiatric Research) **Effects of token reinforcement on productivity in multiply handicapped clients in a sheltered workshop.** *Rehabilitation Literature*, 1969 (Feb), Vol. 30(2), 34-41.—Results "suggest that token reinforcement can be successfully applied to the problem of increasing productivity in multiply handicapped clients in a sheltered workshop. The use of points . . . led to a significant increase in work rates . . . and to differentially higher work rates . . . Furthermore, the removal of points was followed by a significant decrease in work rates. These findings systematically replicate results previously reported."—G. Steele.

COUNSELING & GUIDANCE

1121. Helfer, R. & Hess, J. (U. Colorado, Medical School) **An experimental model for making objective measurements of interviewing skills.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 327-331.—A model for making objective measurements of interviewing skills was standardized by training simulators to portray mothers. A measuring technique was developed with 11 behavioral categories used for interaction analysis. A 2nd instrument consisting of a checklist of factual material was filled out by raters. The training of the raters was presented along with data collection. The technique was capable of measuring individual differences in specific categories.—E. J. Kronenberger.

1122. Krumboltz, John D. & Thoresen, Carl E. (Eds.) (Stanford U.) **Behavioral counseling: Cases and techniques.** New York, N.Y.: Holt, Rinehart, & Winston, 1969. xi, 515 p. \$7.95.

1123. Taylor, Peter A., Ford, Susan F., & Cotter, Norman H. (U. Manitoba, Winnipeg, Canada) **A multivariate study of counselor viewpoints.** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 45-50.—Investigated the perceived importance of some empirically determined goals of counseling. Such goals are viewed as differently structured and of differential importance to various referent groups (counselors, teachers, students).—P. McMillan.

Marriage & Family

1124. Alger, Ian & Hogan, Peter. (New York Medical Coll.) **Enduring effects of videotape playback experience on family and marital relationships.** *American Journal of Orthopsychiatry*, 1969 (Jan), Vol. 39(1), 86-94.—Uses the playback of videotape recordings made during a therapy session as a new therapeutic tool. Participants grasp better the context and complexities of human interactions. Sharing this data with therapists leads patients to a more democratic therapeutic interaction, with implications for more democratic functioning in the families themselves.—*Journal abstract*.

1125. Roberts, Winifred L. (John Scott Health Centre, London, England) **Working with the family group in a child guidance clinic.** *British Journal of Psychiatric Social Work*, 1968 (Fall), Vol. 9(4), 175-179.—Discusses developments in a clinic operating in a working-class area "with a high percentage of deprived and disintegrated families." Methods of referral selection and treatment are reviewed. It is concluded that families most suitable for treatment are those who: (a) function at a primitive level and can only achieve growth as a unit, or (b) are sufficiently mature individually but prefer help as a unit.—P. McMillan.

Social Casework

PHYSICAL HANDICAP

1126. Brookfield, Katharine K. (Columbia U.) **Attitudes of the disabled and nondisabled toward self and toward disabled and normal persons.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5222.

Blindness & Visual Disorder

1127. Bradley, Noel. (1194 Cragmont Ave., Berkeley, Calif.) **Colour blindness: Notes on its developmental and clinical significance.** *International Journal of Psycho-Analysis*, 1970 (Jan), Vol. 51(1), 59-70.—Anomalous color vision exists in 1 out of 12 Caucasian males. 3 analysts are described who became aware of their defect only in adult life, and the meaning of color blindness to a 4th with normal vision is reported. An attempt is made to comprehend the developmental consequences of the defect and the successful effort to prevent awareness of it both subjectively and by others. It is claimed that color defect operates as an independent factor that may exacerbate a sense of uncertainty in the form of tendencies to doubt and of insecurity in object relations. (27 ref.)—*Journal summary.*

1128. Fraiberg, Selma. **Parallel and divergent patterns in blind and sighted infants.** *Psychoanalytic Study of the Child*, 1968, Vol. 23, 264-300.—Discusses the ego as the agency of adaptation for biological and environmental processes and investigates adaptive problems caused by blindness and other visual defects. Obstacles to adjustment and adaptation frequently occur in the areas of human relations, motor achievements, defense mechanisms, object relations, formation of stable mental representations, expression of aggression, and integration of experiences. In addition, the blind child's ego is seen to have prolonged vulnerability in childhood. Clinical examples are given. (16 ref.)—*Journal summary.*

1129. Heslinga, K. & Tieman, G. **Een onderzoek naar het rechtuit kunnen lopen van blinde kinderen.** [An investigation about the ability of blind children to walk directly forward.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970 (May), Vol. 25(5), 315-321.—Investigated whether or not blind children can maintain a specified direction in walking a certain distance in the absence of nonvisual cues. Ss were 35 totally blind, 6-20 yr. olds (21 boys and 14 girls). Ss were placed on a pavement and directed to walk 60 m. from the starting point. The variations in the directions walked described a curve centered at the starting point. Faces of the Ss were pointed toward the end of the southeast axis. Heels of the Ss were placed against a beam. No auditory and atmospheric cues were apparent. Each S walked the distance 6 times. Right- and left-handed canes were alternated after 3 attempts. Only 5 Ss attained the end once each. The median variation from the end was 8.29° within a range of 57°. Alternating the canes of the Ss did not produce any significant change. The lateral dominance of the Ss was indicated by a greater number of shifts to the right than to the left.—A. J. Ter Keurst.

1130. Kaplan, A. I. (Inst. of Defectology, Moscow, USSR) **Tsvetorazlichenie u lits s nizkim zreniem.** [Color discrimination in persons with limited vision.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 54-56.—Includes the results of a study of the capacity of color discrimination in 230 school and kindergarten children possessing either visual acuity below .05 or only color sensation. Along with normal trichromasia, a certain capacity to discriminate color was encountered with visual acuity below .01. In a number of cases, the various disorders of color discriminability were observed.—I. D. London.

1131. Montan, Karl. (Swedish Central Committee for

Rehabilitation, Bromma) **A better urban environment for people with visual impairment.** *Rehabilitation Literature*, 1960 (Jan), Vol. 30(1, Pt.1), 14-15.—Presents a study based on interviews with people with visual impairment and on practical tests. Many practical suggestions are contained as to the placing of lampposts and parking meters; methods of identifying names of streets, street numbers, and shops; guide railings and surfaces; acoustic signals, among other items, all of which affect the degree of ease and safety with which a person with visual impairment can move about.—*Journal abstract.*

1132. Rabkin, E. B. (All-Union Research Inst. of Railway Transport Hygiene, Moscow, USSR) **Metody spektral'noi indikatsii.** [Methods of spectral indication.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 43-48.—Develops a new spectral equation, which is applicable to that part of the spectrum, optimal for the functional capacity of the eye in the process of adaptation, and which allows for the exact differentiation of various forms of congenital color disorders.—I. D. London.

Deafness & Hearing Disorder

1133. Katsounis, Bill. (State University Coll. New York, Buffalo) **Differences in verbal creative thinking abilities between deaf and hearing children.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 727-733.—Obtained fluency, flexibility, and originality scores from Thinking Creatively With Words, Form A, given to 418 deaf and hearing 4th-6th graders. Divergent thinking scores were higher for deaf Ss. Fluency scores were dependent upon hearing status, grade level, and sex but not in interaction with each other. Flexibility scores were independent of hearing status, sex, and grade level. Originality scores were dependent upon hearing status, sex, and grade level and upon interaction of grade level with hearing status.—*Journal abstract.*

1134. Knox, Laura L. & McConnell, Freeman. (Bill Wilkerson Hearing & Speech Center, Nashville, Tenn.) **Helping parents to help deaf infants.** *Children*, 1968 (Sep), Vol. 15(5), 183-187.

SPEECH DISORDER

1135. Belova-David, R. A. & Grinshpum, B. M. (Eds.) **Narushenie rechi u doskol'nikov.** [Speech disturbance in preschool children.] Moscow, USSR: Prosveshchenie, 1969. 216 p.—Presents a collection of 11 papers examining the forms of different speech defects, and the principles and methods for overcoming them. They are based on the work of 15 yr. at the Moscow Municipal Psychoneurological Center for Children and Adolescents.—I. D. London.

1136. Bruten, Gene J. & Shoemaker, Donald J. (Southern Illinois U.) **Additional comments on "The modification of stuttering."** *Journal of Communication Disorders*, 1970 (Jun), Vol. 3(1), 68-75.—Responds to comments by reviewers concerning E. J. Bruten and D. J. Shoemaker's "The modification of stuttering." Clarification is given on the authors' stand on procedures to be used for modifying stuttering, the relationship between negative emotion and fluency failure, and the role of constitutional and genetic factors in stuttering. It is concluded that critical comments on these issues have served a useful function in identifying areas that need

further research, but that the resulting data will probably require both sides to change their views. (20 ref.)—*M. Maney.*

1137. Fisher, Martin N. (Adelphi U., Inst. for Advanced Psychological Studies) **Stuttering: A psychoanalytic view.** *Journal of Contemporary Psychotherapy*, 1970 (Win), Vol. 2(2), 124-127.—Discusses how the psychoanalytic theory of stuttering relates to other theories and describes M. Fisher's investigation of the theory that stuttering is "a pregenital conversion neurosis" and "a monosymptomatic manifestation of fixation at the anal stage of psychosexual development." Results which showed that stutterers and nonstutterers assigned significantly different meanings to anal scenes, while they did not display these differences when examined using word stimuli, are interpreted as supporting the proposed psychoanalytic position. It is suggested that results imply reexamination of the approaches to therapy with stutterers, with a view toward more attention to character problems and less emphasis on speech rehabilitation which may serve only to reactivate the earlier childhood conflict with parents. It is further suggested that the training of speech therapists working with stutterers will eventually have to include a psychotherapeutic approach.—*M. Maney.*

1138. Frisch, Giora R. (U. Tennessee) **A neuropsychological investigation of "functional" disorders of speech articulation.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5237.

1139. Froeschels, Emil. (Pace Coll.) **Observations on aphasia and ideational type.** *Journal of Communication Disorders*, 1970 (Jun), Vol. 3(1), 65-67.—Demonstrates "the logical necessity of knowing the premorbid psychologic type of an aphasic case both as an aid in clearing up the diagnostic problems and also in planning therapy." It is suggested that although "many more educators, especially those working with language-learning disorders, recognize the importance of testing children to find out among other things which type they belong to...typing should routinely be on either medical or educational records, for once the patient has suffered a cerebral insult it is very difficult if not impossible to ascertain the type."—*M. Maney.*

1140. Goodglass, H. & Hunter, M. (Veterans Administration Hosp., Boston, Mass.) **A linguistic comparison of speech and writing in two types of aphasia.** *Journal of Communication Disorders*, 1970 (Jun), Vol. 3(1), 28-35.—Samples of free narrative obtained in speech and writing from a Wernicke's (sensory) and a Broca's (motor) aphasic showed the same contrasting features in both media of expression. The Wernicke's aphasic was more fluent grammatically and had a greater proportion of nonpicturable nouns and verbs. The quality of grammatical errors was similar in both media with the Wernicke's aphasic making many more semantically based errors. Both Ss showed a reduced proportion of verbs to nouns in writing as compared to speech and particularly a reduction in the high-frequency nonpicturable verbs which occur in the filler-phrases of conversation.—*Journal abstract.*

1141. Kryshova, N. A., Shteingart, K. M., & Raichev, R. I. (Inst. of Physiology, Leningrad, USSR) **Nekotorye osobennosti sistemoi funktsii rechi pri afazii.** [Some characteristics of the systemic functioning of speech in aphasia.] *Doklady Akademii Nauk SSSR*, 1970, Vol. 192(2), 462-465.—65 patients with 1-5 yr. old histories of aphasia and 60 normal controls were asked to repeat

words, name objects, and to associate verbally. Recordings were made of their pulse and respiration rates, GSR, and EMG from speech muscle groups and from the hand. Temporal parameters increased with increasing task complexity in both groups, but their absolute values were considerably higher in experimental Ss. Increase in pulse and respiration rates and in muscular tension of the hand were observed only in the experimental Ss. The latter also had a more pronounced GSR, which did not return to base level after the initial orienting response.—*L. Zusne.*

1142. Svobda, James S. & Weidner, William E. (Highland View Hosp., Cleveland, O.) **Auditory verbal recognition ability of aphasic adults under two conditions of listening.** *Acta Symbolica*, 1970 (Spr), Vol. 1(1), 12-14. The hypothesis that adult aphasics' auditory verbal recognition ability would be improved by wearing earphones was not sustained on a sample of 8 Ss. The use of earphones introduced variability into the response patterns of the Ss.—*M. Cynamon.*

NEUROLOGICAL DISORDER

1143. Argintaru, D., Tăranu, A., Morariu, M., & Matinea, I. **Studiul tulburărilor psihice în scleroza în plăci.** [The study of psychical disturbances in multiple sclerosis.] *Neurologia, Psihiatria, Neurochirurgia* 1968 (Nov), Vol. 13(6), 543-546.—Personality alterations, the most frequently detectable in multiple sclerosis, appear to be affective (41%); affective lability appeared in 19% of the cases, sclerotic eutonia in 17%, and neurotic depressive states in 5%. Intellectual disturbances were encountered in 12% of the cases, especially in the late phases of the disease. Acute psychical fits were seldom observed (2%), and mental confusion during the acute fits was fairly frequent. A similarly important role is played by the location and extent of the lesions and by the patient's personality. (French, German, & Russian summaries)—*English summary.*

1144. Arseni, C., Botez, M. L., Alexandru, Sen, & Dobrotă, I. **Tulburări de memorie la bolnavii cu rezecții ale lobului temporal.** [Memory disturbances in patients with temporal lobe resection.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Jan), Vol. 13(1), 17-24.—Studied memory disturbances in 22 patients with resection of the temporal lobe for tumors and epilepsy. In Ss with right (N = 16) and left (N = 6) temporal resection, results were poorer than for controls. In A. Rey's word test for determination of verbal-auditory memory and in a reconstruction of a series of visual stimuli with Vermeyen figures, Ss with right temporal resection gave better results than those with left resection; in the "20 + 20" geometrical figures tests, Ss with left temporal resection gave better results. (French, German, & Russian summaries) (17 ref.)—*English summary.*

1145. Barbeau, André. (U. Montreal, Quebec, Canada) **L-dopa therapy in Parkinson's disease: A critical review of nine years' experience.** *Canadian Medical Association Journal*, 1969 (Dec), Vol. 101(13), 791-800.—Reviews the investigations of the past 10 yr. of cerebral catecholamines, particularly dopamine. The low dopamine content in the basal ganglia and in the urine of patients with Parkinson's disease led to the use of the precursor 3-(3,4-dihydroxy phenyl)-alanine (DOPA) in the treatment of this disorder. Both oral and iv routes were utilized and effects were noted upon

akinesia and rigidity. Doses were low and results controversial. Higher oral levels of L-dopa proved beneficial in action on parkinsonian symptoms and signs. Troublesome side effects, the worst of which were hypotension and a variety of abnormal involuntary movements came to light. New approaches to the therapy have been tried and the sum total of these observations challenges positions regarding a logical chain of events. It is felt that such new approaches will result in better and safer methods of treatment. (French summary) (124 ref.)—*Journal abstract*.

1146. Bogolepov, N. K., Pokrovskii, A. V., & Barinov, N. P. (2nd Moscow Medical Inst., USSR) **Nevrologicheskaya simptomatika ateroskleroticheskikh anevrizm bryushnoi aorty s sindromom Leriche.** [Neurological symptomatology of atherosclerotic aneurisms of the abdominal artery with Leriche's syndrome.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 65-71.—Presents an analysis of the neurological symptoms of 13 49-74 yr. old patients with atherosclerotic aneurisms of the abdominal artery with chronic obliteration of its bifurcational aperture. Neurological syndromes included autonomic, radiculoneuritic, and transitory and stable vascular spinal insufficiency. Clinical picture indicated lesions in the roots of the sacrolumbar plexus and its separate branches, autonomic innervation, and the spinal cord.—*J. D. London*.

1147. Bulandra, R. & Safirescu, Solange. **Considerații asupra tulburărilor psihice din scleroza în plăci.** [Considerations on psychical disturbances in multiple sclerosis.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Nov), Vol. 13(6), 547-552.—Noted mental pathologic manifestations in 14.6% of the 178 multiple sclerosis cases studied. Although the differential diagnosis between pathologic and normal reactive mental phenomena is not precise, critical analysis of the cases revealed certain elements which emphasize the pathologic character of the manifestations: (a) the nature of symptoms (euphoria and intellectual deficit), and (b) alternating psychical and neurologic phenomena. (French, German, & Russian summaries) (17 ref.)—*English summary*.

1148. Chernigovskaya, N. V. (Inst. of Neurology, Moscow, USSR) **K klinicheskoi kharakteristike i differentsial'nomy diagnozu giperkineticheskoi formy rasseyannogo skleroza.** [On the clinical characteristics and differential diagnosis of the hyperkinetic form of multiple sclerosis.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 23-27.—41 patients with hyperkinetic multiple sclerosis were observed. This form of the disease is characterized by pronounced trembling of the dento-rubral type. Differential diagnostic criteria are presented for distinguishing this form from the trembling form of hepatocerebral dystrophy.—*J. D. London*.

1149. Chukhrova, V. A. (Inst. of Neurology, Moscow, USSR) **Izmenenie elektricheskoi aktivnosti mozga u bol'nykh botulizmom.** [Alteration of cerebral electrical activity in patients with botulism.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 52-55.—12 patients with severe forms of botulism were Ss in a study of the EEGs recorded during the disease. The data indicate that the toxin of botulism exercised a specific action on certain neurons of the brainstem reticular formation, producing corresponding changes in the dynamics of the brain potentials. At the end of the 2nd mo. of the disease, the EEGs did not differ from those of normal Ss or they displayed merely slight diffuse changes.—*J. D. London*.

1150. Csiky, K. **Aspecte psihiatrice ale accidentelor vasculare cerebrale.** [The psychiatric aspects of cerebral vascular accidents.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Sep), Vol. 13(5), 457-468.—Describes the acute reversible and irreversible psychotic forms of vascular cerebral accidents, both being considered as psychotic vascular conditions in hypertonic encephalopathies. The acute psychotic aspects of cerebral atherosclerosis are also dealt with, emphasizing the forms with remission, considered as manifestations of a cerebral circulatory insufficiency and the 1st signal of a general circulatory insufficiency. The description is given of both the clinical and EEG aspects of temporal oneiric pseudo-Korsakov syndrome, a form not yet described as psychotic accident in cerebral atherosclerosis. The efficiency of therapeutical interventions on various causal factors of the anoxic-vascular-circulatory complex is demonstrated in model cases. The importance of preventive and early treatment is emphasized. (French, German, & Russian summaries) (15 ref.)—*English summary*.

1151. De Morsier, G. (1 Promenade du Pin, Geneva, Switzerland) **Les hallucinations visuelles diencephaliques. Première partie.** [Visual diencephalic hallucinations: I.] *Psychiatria Clinica*, 1969, Vol. 2(3), 167-184.—Reviews reports concerning diencephalic hallucinations occurring in patients with vascular lesions, tumors, and traumatic brain lesions.

1152. Eisen, A. A. & Norris, J. W. (McGill U., Montreal, Quebec, Canada) **Adrenal steroid therapy in neurological disease: II.** *Canadian Medical Association Journal*, 1969, Vol. 100(2), 66-70.—Examines adrenal steroid therapy and its neuropsychiatric complications. Treatment of pyogenic meningitis, tuberculous meningitis, viral meningoencephalitis, Guillain-Barre syndrome, Carpal-Tunnel syndrome, Bell's palsy, infantile spasms, and cerebral edema are discussed. The complications of psychiatric manifestations, steroid-induced myopathy, benign intracranial hypertension, and steroid glaucoma are presented. (59 ref.)—*G. Steele*.

1153. Erokhina, L. G. & Puchinskaya, L. M. (2nd Moscow Medical Inst., USSR) **Izmeneniye bioelektricheskoi aktivnosti mozga pri tipichnoi nevrologii troinichnogo nerva i simpatol'giyakh litsa.** [Alteration of cerebral bioelectric activity in typical neuralgia of the trigeminal nerve and in facial sympathalgias.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 76-80.—Ss were 105 patients with various algetic syndromes of the face. In typical neuralgia, the EEG showed signs of excitation, desynchronization, and flashes of bilateral paroxysmal activity. These were especially marked in biopotential recordings during and immediately following a neuralgia attack. The data suggest that the observed changes in cerebral bioelectrical potentials indicate the involvement of the brainstem reticular formation in the complex mechanisms underlying the pathogenesis of typical neuralgia of the trigeminal nerve.—*J. D. London*.

1154. Glukhov, B. M. (Medical Inst., Novosibirsk, USSR) **Ob uchastii ribonukleazy v mekhanizme protivovirusnoi zashchity organizma pri kleshchevom entsefalite.** [On ribonuclease participation in the mechanism of antiviral defense of the organism in tick-borne encephalitis.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 45-48.—It is shown that there is a significant increase in ribonuclease activity in the blood and cerebrospinal fluid in the acute period of

tick-borne encephalitis, with the degree of increased enzymatic activity in the blood inversely proportional to the severity of the clinical picture. In the convalescent stage, ribonuclease activity returns to normal.—*I. D. London.*

1155. Grudev, F. I. (Medical Inst., Semipalatinsk, USSR) **K klinike izmenenii nervnoi sistemy pri tulyaremi.** [On the clinical picture of changes in the nervous system in tularemia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 40-45.—Reports results of observations over a 20-yr period of 432 tularemia patients, displaying a variety of mental, neurological, and somatic disorders. The neurological changes incurred are described: affection of the autonomic nervous system, and disorders of the cranial nerves and sensory sphere. Meningitis, meningo-encephalitis, and encephalitis, seen in these cases, usually proceeded with psychotic and diffuse neurological symptoms. The major neuropsychiatric complication in tularemia involves diencephalo-autonomic changes with a marked algic syndrome.—*I. D. London.*

1156. Gusev, V. A. (Medical Inst., Gorky, USSR) **Tuberkuleznyy meningit i beremennost'.** [Tubercular meningitis and pregnancy.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 36-39.—Presents a report based on 14 cases. The onset of the disease was most frequently seen in the 2nd half of pregnancy and was usually very severe.—*I. D. London.*

1157. Himmelhoch, Jonathan; Pincus, Jonathan; Tucker, Gary, & Detre, Thomas. (Yale U., Medical School) **Sub-acute encephalitis: Behavioural and neurological aspects.** *British Journal of Psychiatry*, 1970 (May), Vol. 116(534), 531-538.—Presents the case reports of 8 patients with subacute encephalitis. Behavioral abnormalities were prominent in all. The bizarre behavior induced physicians to ignore neurological findings, to overlook evidence of organic brain syndromes (such as intermittent lucidity and markedly abnormal EEGs), and to make functional diagnoses. Other characteristic features were, (a) the history of good premorbid functioning, (b) the patient's unambiguous role in a supportive, well-functioning family unit, and (c) the poor response of the behavioral symptoms to therapy (especially pharmacologic). (28 ref.)—*Journal summary.*

1158. Kalinovskaya, I. Ya. & Bunina, T. L. (Inst. of Neurology, Moscow, USSR) **Otonevrolgicheskaya simptomatika pri bokovom amiotroficheskom skleroze.** [Otoneurological symptomatology in lateral amyotrophic sclerosis.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 55-60.—127 30-60 yr. old patients were observed in a study showing that otoneurological examinations supplement the clinical picture of the disease, promoting differential diagnosis and broadening conceptions of the topical aspects of the pathological process.—*I. D. London.*

1159. Lyudkovskaya, I. G. & Musatova, I. V. (Inst. of Neurology, Moscow, USSR) **K klinike i morfologii sindroma optikomielita pri ostrom rasseyannom entsfalomielite.** *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 28-32.—Reports on 5 cases involving a joint affection of the optic nerves and spinal cord. A detailed case history is included with histological data on the CNS.—*I. D. London.*

1160. Mamadzhanov, M. & Mamadzhanov, Ya. M. (Central Regional Hosp., Khodzhen, USSR) **Primenenie vnuritazovoi novokainovoi blokady pri ishiaradikulitakh.** [Application of intrapelvic novocaine

block in ischiadiculites.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 80-82.—47 patients and outpatients with acute forms and exacerbation of chronic forms of lumbosacral radiculitis and sciatica of varied etiology were observed. The statistics of recovery are presented.—*I. D. London.*

1161. Manelis, Z. S. (Medical Inst., Sverdlovsk, USSR) **Nekotorye voprosy patogeneza pervichnykh infektsionnykh entsfalomielopoliradikulonevritov.** [Several problems in the pathogenesis of primary infectious encephalomyelopolyradiculoneurites.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 32-36.—Making use of oscillography, rheography, capillaroscopy, and the Lendis test, the vascular functional state was studied in 146 patients. Correlation of the morphological and clinical data point to the special role of increased vascular permeability in the pathogenesis of these diseases.—*I. D. London.*

1162. Mordock, John B. & DeHaven, George E. (Pennsylvania State U.) **Movement skills of children with minimal cerebral dysfunction: The role of the physical therapist.** *Rehabilitation Literature*, 1969 (Jan), Vol. 30(1, Pt. 1), 2-8.—Provides a background for understanding the need for studies of the effects of remediation programs for children with minimal cerebral dysfunction. Reviews are included of: selected studies describing movement deficits of children with minor manifestations of cerebral dysfunction; studies relating movement skills to other perceptual and behavioral processes; articles expressing opinions or describing unresearched programs concerning needs for training in movement skills; and the role of the physical therapist and a rationale for remedial programs. (44 ref.)—*Journal abstract.*

1163. Moskalenko-Sadovnikova, L. G., Lange, E., & Heidel, G. (Medizinische Akademie Gustav Carus, Dresden, E. Germany) **Beitrag zu Klinik und Pathologie der Hirncysticercose.** [Contribution to the clinical picture and pathology of cerebral cysticercosis.] *Psychiatria Clinica*, 1969, Vol. 2(4), 212-231.—Reviews essential facts concerning clinical aspects and pathology of cerebral cysticercosis. Reports personal experience with 21 cases of the disease which were psychiatrically investigated and pathologically assessed. An attempt was made to distinguish between: (a) the pathodynamic activity of living and dead cysticercs, and (b) focal symptoms caused by cysticercs and remote symptoms located at distances up to 9 cm. from the cyst. (17 ref.)—*English summary.*

1164. Naku, A. G., Mikhlin, V. M., & Grinberg, D. M. (Medical Inst., Kishinev, USSR) **Kliniko-élektroentsfalograficheskie сопоставления при аментивном синдроме.** [Clinico-electroencephalographic correlations in the amental syndrome.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 87-93.—Studied the clinical picture and EEGs of 65 patients with amental syndromes of varied etiology, 25 former patients (4 mo.-4 yr. after clinical recovery), and 25 healthy students (controls). Relationships were established between type of bioelectrical activity at rest, reactivity of biocurrents, gravity of amentia, character of the leading syndrome, etiological factors, and supplementary clinical manifestations. The possible pathogenetic mechanisms of amentia and the essential nature of predisposal toward amental disorder of consciousness are discussed.—*I. D. London.*

1165. Rivina, E. Yu. **Ocherki po klinike i lecheniyu**

porazhenii ékstrapiramidnoi sistemy cheloveka. [Essays on the clinical picture and treatment of lesions in the human extrapyramidal system.] Moscow, USSR: Meditsina, 1968. 319 p.—The morphology, physiology, and pathophysiology of the extrapyramidal system are given extended treatment in this monograph.—*I. D. London.*

1166. Savenko, S. N. (Medical Inst., Chernovitsk, USSR) O trudnostyakh diagnostiki nekotorykh demieliniziruyushchikh zabolevanií nervoi sistemy. [On the diagnostic difficulties of several demyelinating diseases of the nervous system.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 18-23.—Diagnosis and differentiation are attended by great difficulties. The following are the most important symptoms for the diagnosis of diffuse multiple sclerosis: (a) severe mental disorders in the form of progressive organic dementia, (b) a distinct and usually symmetrical dilatation of the brain ventricles, and (c) gross changes in the EEG. Occasional cases of atypical multiple sclerosis are mistakenly diagnosed at their onset as schizophrenia with counterdisclosure with the advent of cerebellar symptoms in the terminal stage. In adults subacute leukoencephalitis sometimes proceeds with myoclonia and typical EEG changes.—*I. D. London.*

1167. Schaltenbrand, G. (Ed.) *Spezielle neurologische Untersuchungsmethoden*. [Special neurological methods of examination.] Stuttgart, W. Germany: Stuttgart U., 1968. 192 p.—Presents a collection of articles on the bases and application of contemporary examination procedures, utilized in neurology and neurohistology.—*I. D. London.*

1168. Smoczyński, S. (Medical Academy, Gdańsk, Poland) Psychopathological changes in cases with temporal electroencephalographic abnormalities. *Polish Medical Journal*, 1969, Vol. 8(2), 474-480.—Analyzes 130 cases with EEG changes in the temporal areas of the brain. Pneumoencephalography was performed in most Ss, along with thorough psychiatric, psychological, neurological and physical examination. Psychic disturbances were found in 129 Ss. Temporal lobe epilepsy was diagnosed in 56 Ss. Characteropathy was the most frequent diagnosis. In Ss with schizophrenic symptomatology, only in chronic cases could the relationship to temporal lobe damage be suggested. In the differential diagnosis simple schizophrenia, episodic schizophrenia-like syndromes and coexistence of schizophrenia with organic brain damage should be taken into account. (26 ref.)—*Journal abstract.*

1169. Tessier, Florence A. (U. California, Los Angeles) The development of young cerebral palsied children according to Piaget's sensorimotor theory. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4841.

1170. Vaneeva, G. G. (Medical Inst., Perm, USSR) Sostoyanie slukhovoí i vestibulyarnoi funktsii pri kleshchevom éntsefalite. [State of the auditory and vestibular functions in tick-borne encephalitis.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 48-51.—50 patients with tick-borne encephalitis were Ss in a study of the auditory and vestibular functions in the acute period of the disease (the former through direct voice and audiometric methods; the latter through spontaneous, experimental, and optokinetic nystagmus). It is concluded that: (a) changes in these functions in tick-borne encephalitis are encountered regularly and are independent of the clinical form of the disease; (b) in

most patients the changes are temporary, but in a few, who have suffered a focal form of the disease, the changes persist even when tested 6-12 mo. after recovery; and (c) investigation of the auditory and vestibular functions should be part of the general examination, since in attenuated and febrile forms of the disease, they may have diagnostic importance.—*I. D. London.*

1171. Vinken, P. O. & Bruyn, G. W. (Eds.) *Handbook of clinical neurology: I-IV*. Amsterdam, Holland: North Holland Publishing, 1969. 2460 p.—These are the 1st 4 volumes of an intended set of 30 volumes in English to appear in the course of 8 yr. Volume I contains contributions on "disturbances of nervous functions"; Volume II, on "localization of clinical neurology"; Volume III, "disorders of higher nervous activity"; and Volume IV, "disorders of speech, perception, and symbolic behavior."—*I. D. London.*

[Application of the probability calculus in the differential diagnosis between cerebral vascular accidents and the acute onset of cerebral tumors.] *Neurologia, Psihiatria, Neurochirurgia*, 1968 (Jan), Vol. 13(1), 11-16.

Brain Damage

1173. Butters, Nelson & Barton, Melvin. (Veterans Administration Hosp., Boston, Mass.) Effect of parietal lobe damage on the performance of reversible operations in space. *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 205-214. Tested 50 patients with cerebral damage on 3 tasks requiring the performance of reversible operations in space. Damage to either the right or the left parietal lobes resulted in impairments on all 3 tasks; lesions in other cortical areas resulted in slight, if any, deficits. It is suggested that the inability to assume different perspectives in imagery underlies many of the impairments associated with parietal lobe damage, i.e., constructional apraxia and right-left disorientation. (French & German summaries) (17 ref.)—*Journal abstract.*

1174. Crinella, Francis M. (Louisiana State U., A & M Coll.) An analysis of patterns of brain dysfunction and suspected brain dysfunction in school aged children. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5234-5235.

1175. De Morsier, G. (Promenade du Pin, Geneva, Switzerland) Le hallucinations visuelles diencéphaliques: II. [Diencephalic visual hallucination: II.] *Psychiatria Clinica*, 1969, Vol. 2(4), 232-251.—While observing a case of visual hallucinations localized in the left 1/2 of the visual field, without hemianopsia but showing left-sided sensorimotor hemiparesis, it was concluded that the symptoms could be explained by a lesion of the right diencephalon. A large number of antomoclinical cases have confirmed this hypothesis (i.e., vascular foci and hemorrhages in the thalamus, tumors, and changes in the diencephalon following cranio-cerebral trauma). In these cases the visual hallucinations resemble those found after lesions of or following stimulation of the occipito-temporo-parietal cortex, resulting from changes in the paraviscual sphere. Stereotactic experiments confirm the role played by the

diencephalon in the genesis of visual hallucinations. (German summary) (5 p. ref.).—*English summary.*

1176. Edwards, H. (Whitchurch Hosp., Cardiff, Wales) **The significance of brain damage in persistent oral dyskinesia.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 271-275.—Brain damage was found more often with elderly females having mouth motor problems than with controls matched on sex, age, and phenothiazine intake. The possible effects of prolonged medication with phenothiazines, which may either cause brain damage or potentiate fits in patients with preexisting disease of the brain, are discussed.—R. L. Sulzer.

1177. Johnson, J. (Manchester U., Royal Infirmary, England) **The EEG in the traumatic encephalopathy of boxers.** *Psychiatra Clinica*, 1969, Vol. 2(4), 204-211.—Investigates psychiatric and physiological results of cumulative brain trauma in 17 retired boxers by means of EEG findings, clinical impressions, and psychometric tests. Results show abnormal EEGs in 10 Ss, 1 of which was severely abnormal. EEG abnormalities consisted mainly of an alpha dominant record with slow background activity (7 cases) or flat, low voltage records with minimal or absent alpha rhythm (3 Ss). Psychometric tests (WAIS, Benton Visual Retention Test, and an Auditory Word Learning Test) were abnormal in 11 of 15 tested Ss. Further investigation with serial assessment of the same parameters is advocated.—B. A. Stanton.

Epilepsy

1179. Boldyrev, A. I. **Osnovnye printsipy klassifikatsii épilepsii.** [Basic principles in the classification of epilepsy.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 143-150.—Discusses various views that have been developed to deal with the problem of classifying the epilepsies. Regardless of the classification adopted, the complex features of epilepsy must be considered in its 3 basic aspects: etiological, anatomic, and clinical. (69 ref.).—I. D. London.

1180. Jasper, Herbert H., Ward, Arthur A., & Pope, Alfred. (Eds.) (U. Montreal, Quebec, Canada) **Basic mechanisms of the epilepsies.** Boston, Mass.: Little, Brown, 1969, xxiv, 835 p. \$30.

1181. Peters, U. H. (147 Niemannsweg, Kiel, W. Germany) **Das pseudopsychopathische Affektsyndrom der Temporallappenepileptiker: Untersuchungen zum Problem der Wesenänderung bei psychomotorischer Epilepsie.** [The pseudopsychopathic effect syndrome of temporal lobe epileptics: Investigations concerning the problem of character change in psychomotor epilepsy.] *Nervenarzt*, 1969 (Feb), Vol. 40(2), 75-82.—Describes a pseudopsychopathic affect syndrome isolated in 53 of 67 investigated patients with temporal lobe epilepsy. Although Ss did not demonstrate any constant character change, changes of affect and mood (varying between friendly and hostile-aggressive) were observed. Personality traits included infantile-egocentric and hypochondriacal manifestations. The consequence was a disturbed social adjustment. No evidence of IQ impairment was detected. (36 ref.).—B. A. Stanton.

1182. Petrov, V. S. (Bekhterev Psychoneurological Inst., Leningrad, USSR) **Ul'trastrukturnye osobennosti yadernykh i tsitoplazmaticheskikh élementov v kletkakh kory golovnogo mozga bol'nykh s épilepticheskimi pripadkami i bez nikh.** [Ultrastructural features of the nuclear and cytoplasmic elements in the cerebral cortical cells in patients with epileptic attacks and without them.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 106-115.—Materials, procured through biopsy of the tumorous cortex in 9 cases of brain tumor, were utilized in a study of the comparative electron-microscopic characteristics of the nuclear and cytoplasmic elements of the cerebral cortex in 2 groups of patients—those with and without epileptic seizures. In the region of the neoplasms altered nerve cells, isolated neurons with relatively preserved structures, and a morphologically distinct endoplasmic reticulum appeared. In most of the cerebral neurons and oligodendrocytes of Ss without epileptic seizures, there was a relatively small number of filamental and granular structures in the nuclei, ribosomes, mitochondria, membranes of the Golgi apparatus, etc. In similar brain cells of Ss with epileptic seizures, enlarged mitochondria with an electron-optically bright matrix and vesicles in the Golgi apparatus appeared, and inclusions with different ultrastructural organization along with relative preservation of the elements of the nuclei and nucleoli.—I. D. London.

1183. Robins, Max H. (150 Truax St., Trenton, Mich.) **Hypsarhythmia: Infantile spasms.** *Journal of the American Osteopathic Association*, 1968 (Apr), Vol. 67(8), 882-888.—Describes an unusual epileptic disorder of infancy which often results in severe mental retardation. The infantile spasms frequently are associated with a characteristic EEG pattern of hypsarhythmia and appear to be the clinical expression of extensive but often unrecognized brain damage occurring in the prenatal or early postnatal period. A case of infantile spasms in an 11-wk-old boy is reported that documents the effect of a massive insult upon an immature nervous system. The possibility that the spasms were secondary to some cerebral insult is considered. In such instances treatment is uniformly disappointing with poor control of spasms and invariable mental retardation. The best response to treatment has been achieved in primary or idiopathic cases in which the clinical picture was recognized early and treatment initiated shortly after the onset of the seizures. (19 ref.).—*Journal abstract.*

MENTAL RETARDATION

1184. Adams, Margaret E. **Developing child welfare services for the mentally retarded.** *Mental Retardation*, 1968 (Oct), Vol. 6(5), 23-26.—Discusses the function of normal child welfare services in providing social care to prevent, reduce, or alleviate social adjustment problems experienced by retarded children and their families. The way in which emerging societies can build up a preventive or remedial service for retarded children by utilizing their indigenous social resources was examined. This may have some applicability to grass-roots development of services in the United States. (17 ref.).—*Journal abstract.*

1185. Alpern, Gerald D. & Kimberlin, Carolyn C. (Indiana U., Medical School, Indianapolis) **Short intelligence test ranging from infancy levels through childhood levels for use with the retarded.** *American*

Journal of Mental Deficiency, 1970 (Jul), Vol. 75(1), 65-71.—Developed a short, general intelligence test for retarded children whose abilities ranged from infancy levels through childhood levels. Standard administration of Cattell and Stanford-Binet tests to 28 mongoloid children provided data statistically used to develop a $2\frac{1}{3}$ shorter test. The short and standard versions were then administered to a new sample of 31 retarded children. Correlation between the short and standard tests was .97. The average administration time for standard testing was 60 min. compared to 16 min. for the short form. Vineland scores and standardized psychiatric ratings developed correlations beyond the .001 level of confidence with the short form. The theory and techniques for intellectual evaluations of retarded children are discussed. (26 ref.)—*Journal abstract*.

1186. Ayers, George E. & Duguay, A. Robert. (Mankato State Coll.) **Critical variables in counseling the mentally retarded.** *Rehabilitation Literature*, 1969 (Feb), Vol. 30(2), 42-44, 50.—The emotional problems, level of intellectual functioning, personality characteristics, communication factors, learning ability, parental influences, and environmental factors are critical variables that necessitate consideration in counseling the mentally retarded. Regardless of the particular theoretical counseling technique or mode of therapy employed, all of these variables directly and indirectly influence the overall adjustment of the retarded. Hence, it is imperative that counselors become aware of them if they are to help the mentally retarded develop to their fullest physical, mental, social, educational, and vocational potential.—*Journal summary*.

1187. Ballinger, B. R. (Strathmartine Hosp., Dundee, Scotland) **Community contacts of institutionalised mental defectives.** *Journal of Mental Subnormality*, 1970 (Jun), Vol. 16(1), 17-23.—Studied community contacts of 629 institutionalized mentally defective patients over a 3-mo period. Results show that: (a) 56.6% of the Ss were visited at least once during this period, but only 7.8% were visited 12 times or more; (b) 39% of the Ss received at least 1 item of mail, 7.9% made unaccompanied visits to town, and 15% had overnight leave during the 3-mo period; and (c) 26.8% of the Ss had little contact with the community, and these tended to have been in the hospital longer, to be older and less intelligent.—*Journal summary*.

1188. Bank-Mikkelsen, N. E. (Danish National Service for the Mentally Retarded, Copenhagen, Denmark) **Services for mentally retarded children in Denmark.** *Children*, 1968 (Sep), Vol. 15(5), 198-200.

1189. Baumeister, A. A. & Forehand, R. (U. Alabama) **Social facilitation of body rocking in severely retarded patients.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 303-305.—Presents 2 studies concerning the rate with which severely retarded persons engage in body rocking as influenced by variations in social context. Study I involved repeated observations of 4 individual patients, and Study II was conducted to determine whether the presence of other nonrocking patients would be an effect on rate of body rocking. Results indicate that rocking was much higher in the presence of other patients than when alone and that social facilitation of rocking does not appear to be imitative.—*E. J. Kronenberger*.

1190. Bricker, William A. (George Peabody Coll. for Teachers) **Identifying and modifying behavioral deficits.** *American Journal of Mental Deficiency*, 1970 (Jul),

Vol. 75(1), 16-21.—Develops the proposition that the major focus in behavior modification should be on procedures of instruction rather than on the process of learning itself. In the area of retarded development, this focal difference stresses analyses of defects in the program of instruction and how to eliminate these defects rather than analyses of the defects inherent in the child's nervous system. However, several changes must be made in current behavior modification technology if the techniques derived from this approach to developmental retardation are to have broad and important consequences. These recommended changes include means for generalizing repertoires, establishing the validity, replicability, and efficiency of training programs, and using training programs as diagnostic instruments. (24 ref.)—*Journal abstract*.

1191. Carlisle, A. Lindsay; Shinedling, Martin M., & Weaver, Richard. **Note on the use of the Slosson Intelligence Test with mentally retarded residents.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 865-866.—Administered the Slosson Intelligence Test (SIT) to 122 male and female institutionalized profound and severe retardates who had previously been given a Stanford-Binet, Kuhlmann Extension of the Binet Test, or Kuhlmann Test of Mental Development. A correlation of .91 was found between scores on the SIT and the Kuhlmann, indicating the SIT as a useful test with severe retardates.—*Journal abstract*.

1192. Chess, Stella & Korn, Sam. (New York U., Medical Center) **Temperament and behavior disorders in mentally retarded children.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 122-130.—Indicates that temperament influences the retarded child's adaptiveness and has important implications for management. 52 5-11 yr. old middle-class children (IQs from 50-75) who were living at home were studied. Results indicate that certain patterns of temperament appear to intensify the stresses to which the retarded child is especially subject. The risk for developing a disturbance is greatest in children who show irregularity in biological functions, withdrawal responses, nonadaptability, predominantly negative mood, and high intensity. Positive parental management of a mentally retarded child with several signs of vulnerability may help achieve better adaptation. Conversely, children who appear least at risk may manifest behavior disorders partly as a result of adverse patterns of care and other environmental pressures. Alertness to the impact of temperament on the Child-Environment interaction can decrease the probability of behavior disorder and strengthen the chances for maximum adaptation.—*Journal summary*.

1193. Devries, Rheta. (U. Illinois, Chicago Circle) **The development of role-taking as reflected by behavior of bright, average, and retarded children in a social guessing game.** *Child Development*, 1970 (Sep), Vol. 41(3), 759-770.—3 studies explored the performance of 3-7 yr. old bright and average, and 6-12 yr. old retarded children (Total N = 248) in a binary-choice, social guessing game. Results suggest a 5-stage sequence of development from a total lack of recognition of the need for secrecy and deceptiveness in the 1st to the 5th stage in which S was competitive and attempted to outwit the opponent by utilizing an irregular, shifting strategy. Stage changes were viewed in terms of increased role-taking ability. The development of competitive and deceptive hiding prior to competitive and deceptive guessing suggests that the child is able to take

account of the other's perspective before he is able to take account of the other's-taking-account-of the child's perspective. Psychometric ability seems to be a more crucial factor than age in the development of role taking at the lower end of the psychometric range, and CA seems to be a more crucial factor than psychometric ability at the average or above range.—*Journal abstract.*

1194. Francis, Sarah H. (Australian National U., Canberra, Capital Territory) **Behavior of low-grade institutionalized mongoloids: Changes with age.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 92-101.—Studied 112 low-grade institutionalized mongoloids. With increasing age, Ss exhibited an increase in self-oriented behavior, in postures, in rocking, and in diffuse movements, and a decreasing interest in the external world (as measured by the focus of their visual attention, manipulation of objects, and the amount of social contact in which they are engaged). More changes in behavior occur between the ages of 4 and 13 yr. and after 30 yr. old than at other ages. It is suggested that the behavioral changes are due to institutionalization rather than to aging.—*Journal abstract.*

1195. Hansen, Holger. (Columbia U.) **Epidemiological considerations on maternal hyperphenylalaninemia.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 22-26.—A review of all reported hyperphenylalaninemic (HPA) mothers and their offspring in the literature showed that most of the families were detected because of recognized mental retardation. Selection bias could explain that 19 of the 26 mothers had mentally subnormal children. However, intrauterine growth retardation, observed in at least 4/5 of the retarded progeny, more common than could be expected, may be attributable to maternal HPA. The maternal blood level did not correlate with progeny IQ when maternal IQ was controlled. Mental retardation was associated with subnormal IQ of the mother and with low birth weight and microcephaly of the child. The biochemical disturbance seems more likely to affect the offspring where it has affected the mother herself. (31 ref.)—*Journal abstract.*

1196. Haywood, H. Carl. (George Peabody Coll. for Teachers) **Mental retardation as an extension of the developmental laboratory.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 5-9.—Discusses how the study of mental retardation can produce more extensive knowledge about the nature and development of IQ and recommends certain strategies. Among these are: (a) sampling across a wide range of IQ, (b) the use of deviant-groups designs, (c) extreme caution in the use of MA matching, (d) finer distinctions within the diagnostic category of mental retardation, (e) control of such influencing variables as institutionalization and personality factors when comparing groups that differ in IQ, and (f) selection of tasks that have common meaning to Ss across a wide range of IQ.—*Journal abstract.*

1197. Heal, Laird W. (George Peabody Coll. for Teachers) **Research strategies and research goals in the scientific study of the mentally subnormal.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 10-15.—Examines the criticism that researchers in the area of mental subnormality have no rationale for selecting their normal comparison groups. An analysis shows research strategies to be in a 1-to-1 correspondence with the goals and assumptions of the investigator

who employs them. In addition, the comparative methodology as it relates to research in mental subnormality is discussed.—*Journal abstract.*

1198. Kirman, Brian. (Queen Mary's Hosp. for Children, Carshalton, England) **The mentally handicapped individual in society.** *Journal of Mental Subnormality*, 1970 (Jun), Vol. 16(1), 9-16.—Discusses the effect that classification and definitions of psychological diseases, mental health legislation, and social and technical change have had on determining the place of the mentally handicapped in society, and on the kinds of institutions to care for them. It is stressed that classification and categories for the mentally deficient are artificial contrivances, unnatural laws, and are determined by the climate of the time. It is argued that the "full development of the human intellect and personality is only to be achieved in the open society," and that this concept should also be applied to the mentally ill who deserve greater status as individuals able to make unique contributions to society. (29 ref.)—*M. Maney.*

1199. Lamb, Lloyd E. & Norris, Thomas W. (U. New Mexico) **Relative acoustic impedance measurements with mentally retarded children.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 51-56.—Compared acoustic stapedius muscle reflex thresholds, measured with an electroacoustic impedance bridge, for 15 5-10 yr. old mentally retarded children and 15 4-11 yr. old normal children. All Ss had normal hearing sensitivity. Reflex thresholds were measured using pure tones of 250, 100, and 4000 Hz. as test signals. Signals were presented in ascending and descending series. Results show reflex thresholds for both groups to be consistent with findings previously reported for normally hearing adults of average IQ. Reflexes occurred at slightly lower levels for mentally retarded than for normal Ss. Descending reflex thresholds were lower than ascending for both groups. Considerable inter- and intra-Subject variability was observed.—*Journal abstract.*

1200. Lombardi, Thomas P. & Poole, Ronald G. (Arizona State U.) **Utilization of videosonic equipment with mentally retarded.** *Mental Retardation*, 1968 (Oct), Vol. 6(5), 7-9.—Describes the potential of a videosonic intercom system within a state institution for the retarded. Particular attention was given to the visual/auditory stimulation offered by video tapes produced for a speech and language development program. It appears that among the didactic materials and equipment designed for the retarded, videosonic instrumentation may increase quality and quantity in special education.—*Journal abstract.*

1201. Luckey, Robert E. & Chandler, Peter J. (Denton State School, Tex.) **Demonstration habilitative and self-care nursing projects for multi-handicapped retardates.** *Mental Retardation*, 1968 (Oct), Vol. 6(5), 10-14.—Complementary habilitative and self-care nursing projects were undertaken to demonstrate the feasibility of promoting optimal overall development and to combat the injurious effects of group custodial living while multihandicapped retardates were still in their formative yr. The primary aims were to: improve body flexibility and control; minimize the effects of structural anomalies; prevent physical malformation; and promote functional hand use, self-concept development, and socialization. Techniques included physical and occupational therapy, enriched staff-patient interaction, structured group activities, and self-identity games.

Results reveal that the overall physical and psychosocial condition of severely handicapped retardates can be significantly improved.—*Journal abstract.*

1202. Martin, Jack W. (U. Oregon) **Attending behavior of mentally retarded males during a fading procedure.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4832-4833.

1203. Mayer, Sondra M. (Teachers Coll., Columbia U.) **Field research on behalf of the handicapped.** *Mental Retardation*, 1968 (Oct), Vol. 6(5), 53.—Examined the possibility of a negative interview effect in employment of retardates. A survey of 87 employers concerning attitudes toward hiring retarded workers showed no attitude change in 88% of respondents. 1 employer showed a positive change and 3 indicated negative changes.

1204. Mittler, Peter. (U. Manchester, Hester Adrian Research Center, England) **Changing attitudes to the mentally subnormal.** *Journal of Mental Subnormality*, 1970 (Jun), Vol. 16(1), 3-8.—The attitudes of the public, patients' families, professionals, administrators, and government toward the mentally subnormal are considered in the light of a critical examination of present services and difficulties. Although attitudes are changing for the better, they have not changed fast enough or always been concerned with the priorities. It is concluded that the impetus for these changes must come from the highest government levels, and that the "goodwill which exists toward positive reform should be exploited by those with a genuine interest in the field."—*M. Maney.*

1205. O'Grady, D. J., Berry, H. K., & Sutherland, B. S. (U. Cincinnati, Children's Hosp.) **Phenylketonuria: Intellectual developmental and early treatment.** *Developmental Medicine & Child Neurology*, 1970 (Jun), Vol. 12(3), 343-347.—8 children, diagnosed early (before 3 mo.) as phenylketonuric, and treated, showed average or above average intellectual development when tested between the ages of 3-8 yr. Some of the families had older siblings with the same disorder, treated later or untreated, all of whom showed marked deficit as compared with their healthy siblings, early treated phenylketonuric siblings, and parents.—*P. W. Priyser.*

1206. Penrose, L. S. (U. London, England) **Measurement in mental deficiency.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 369-375.—The ultimate criteria of subnormality are quantitative making this field biometrical in a way that the rest of psychiatry is not. IQ distributions show that intelligence is not Gaussian but skewed at the extreme lower end. Also the basic assumptions that abilities grow as a linear function of age and at all ages have the same degree of variation are untrue at the lower levels. Spearman's concept of "general intelligence" is termed nonsense, and it is suggested that more attention should be paid to the differences between scores on tests, the "profile" of a patient. Physical measurements of body size, head size and shape, skin ridges on hands and feet, sex chromosomes, and the analysis of family correlations are among the important uses of measurement. (27 ref.)—*R. L. Sulzer.*

1207. Phillips, Susan U. & Dingman, Harvey F. (U. Texas) **On the construction of persons.** *Mental Retardation*, 1968 (Oct), Vol. 6(5), 20-22.—Used the perspective of the theatrical performance developed by E. Goffman to distinguish between back and front regions (as onstage and backstage and dressing room

activities are differentiated) in the social performance of mentally retarded females from a hospital ward. The inappropriateness of overall social performance was traced to the absence of preparation in back regions, i.e., distinctions made by the administration between various activities, for front region activity. Rehabilitation of the retarded may necessitate a greater therapeutic emphasis on back region preparations.—*Journal abstract.*

1208. Pustel, G., Sternlicht, M., & Derespini, M. (Willowbrook State School, Staten Island, N.Y.) **Perception of emotionality by institutionalized mental retardates.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 306-307.—Compared retardates to schizophrenics and normals on tasks involving moonface line drawings. The retardates were least capable of producing flawless pictorial arrangements along a facial-emotional continuum. There was no significant difference between groups for judgment of matching moonfaces and stimulus words. While supporting previous research, the results indicate that retardates' errors differed in quantity from both schizophrenics and normals.—*E. J. Kronenberger.*

1209. Shapiro, Alexander. (Harperbury Hosp., Shenvley, St. Albans, England) **The clinical practice of mental deficiency.** *British Journal of Psychiatry*, 1970 (Apr), Vol. 116(533), 353-368.—Mental deficiency is social incompetence, usually with low intelligence, but often with personality defects produced by a variety of causes. Prevention and cure seem still to be in the province of research, but treatment aimed at enabling the person to function independently in society is best provided under the supervision of a psychiatrist specialist. Training should be pushed no farther than the capacity, it should aim to end some time with the goal for the patient being use for living of what he has learned. Large hospitals make possible integration of all aspects of care with provision for all required specialist services. Subunits can develop intensive therapy beyond the resources of community care. (18 ref.)—*R. L. Sulzer.*

1210. Small, John R. & Shafter, Albert J. (The Daily Register, Harrisburg, Ill.) **Publication of a newspaper by residents of a facility for the retarded.** *Mental Retardation*, 1968 (Oct), Vol. 6(5), 27-28.—There has been increased interest in recent yr. in developing comprehensive recreation or activity programs in residential facilities for the mentally retarded. 1 aspect of such programs has been publication of newspapers by the residents. The development of such a program was improved by the employment of a professional journalist who trained the aides to work with the residents. In addition to obtaining primary skills in journalism, the residents changed certain behavior and attitudes and developed greater social awareness.—*Journal abstract.*

1212. Sternlicht, Manny; Deutsch, Martin, & Alperin, Norman. **Psychological evaluations and teacher assessments of institutionalized retardates.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 164-167.—Reviews a random sample of 100 cases referred to the psychologist by classroom teachers as to the extent of agreement between psychologist and teacher. The greatest discrepancy occurred in the referral category "working above potential." It is suggested that psychologists and teachers examine the relationship between measured

psychological potential and actual performance.—H. Kaczkowski.

1213. Taylor, John F., Winslow, Charles N., & Page, Horace A. (Kent State U.) **An MA growth curve for institutionalized mild and moderate retardates.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 47-50.—Used data from 636 Binet examinations given to 97 institutionalized mild and moderate retardates to derive a composite MA growth curve. The curve was negatively accelerated, and the period of marked slowing in mental growth appeared to begin at about the 10th birthday. After about the 13th birthday, the rate of mental growth appeared to stabilize at approximately $\frac{1}{4}$ the rate of mental growth for persons of normal IQ. (23 ref.)—*Journal abstract.*

1214. Weiner, Barbara J. (Purdue U.) **A comparison of the toy play characteristics of organic mentally retarded and normal children.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5230-5231.

1215. Willis, Virginia L. & Garrison, Mortimer. (Temple U.) **Spoken language abilities of educable mentally retarded (EMR) and normal adolescents.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 696-698.—Analyzed stories told by 14 EMR and 14 normal adolescents for length, sentence length, type-token ratio, usage of parts of speech, and grammatical correctness. Normal Ss used longer sentences and a greater variety of words in contrast to the differences observed with written compositions. Results emphasize the importance of teaching communications skills directly.—*Journal abstract.*

1216. Wooster, Arthur D. (U. Nottingham, Inst. of Education, England) **Formation of stable and discrete concepts of personality by normal and mentally retarded boys.** *Journal of Mental Subnormality*, 1970 (Jun), Vol. 16(1), 24-28.—Compared 16 subnormal and 16 normal 14-14.10 yr. old boys to test the hypothesis that there would be a significant difference between the groups in their ability to achieve a stable self-concept and in the degree to which that self-concept was related to other concepts about people. It was also predicted that a related difficulty for the subnormal would be revealed by their greater use of groupings of concepts resulting from the inability to perceive differences. Ss ordered 8 pictures in response to injunctions which embodied 8 concepts. Results support the hypotheses, and it is suggested that the inability to make fine discriminations in social situations is 1 source of the social ineptitude of the subnormal. The inability of many subnormals to use their self-concept as a standard in making judgments about others is thought to contribute to this failure to form stable relationships with others.—*Journal summary.*

Learning & Motor Ability

1217. Auger, Robert A. (U. South Carolina) **The effect of stimulus shaping training on the establishment of a discriminatory response and post-generalization gradient with retardates.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5231.

1218. Ellis, Norman R., McCarver, Ronald B., & Ashurst, Hugh M. (U. Alabama) **Short-term memory in the retarded: Ability level and stimulus meaningfulness.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 72-80.—Compared 3 ability level (IQ) groups of 36 institutionalized retardates on a probe-type

short-term memory task using high meaningful and low-meaningful stimuli. It was predicted, on the basis of a multiprocess theory of memory, that primacy of the serial position curve would be facilitated in the higher-IQ Ss as a result of more adequate rehearsal strategies and higher language skills. Primacy performance was also expected to be facilitated by the more meaningful stimuli. Primacy performance was directly and substantially related to IQ. The effects of meaningfulness were negligible.—*Journal abstract.*

1219. Gallagher, Joseph W. (U. Alabama) **Effect of meaningfulness on learning syntactic units.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 27-32.—Examined the influence of meaningfulness (semantic consistency) and nonmeaningfulness (anomaly) on the learning of syntactic word pairs with 36 3rd grade normal and 36 institutionalized retarded children. Using a paired-associate technique, Ss were presented with either a list of meaningful word pairs or non-meaningful pairs. Results show that meaningful pairs were learned more readily than nonmeaningful pairs at both ability levels. No differences were found between normals and retardates for the meaningful pairs. Normals learned the nonmeaningful pairs with fewer errors than the retarded Ss. This latter finding is discussed in terms of types of overt errors made and presentation rate.—*Journal abstract.*

1220. Gallagher, Joseph W. & Reid, Donald R. (U. Alabama) **Effect of free association strength values on paired-associate learning.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 33-38.—Examined the influence of free association strength (FAS) on paired-associate learning with 75 1st and 75 3rd grade nonretarded children and 75 institutionalized retarded children matched for MA with the 3rd grade Ss. Results indicate that the mean number of errors decreases as FAS increases. Performance of the retarded Ss was similar to that of the 3rd grade group for the highly associated pairs, but for weakly associated pairs the retarded group's performance was more like that of the 1st grade Ss.—*Journal abstract.*

1221. Glenn, Sheila M. & Pickersgill, Mary J. (Goldsmiths' Coll., London, England) **Capacity of severely subnormal children with relation to the non-additivity of cues effect and to discrimination difficulty.** *Quarterly Journal of Experimental Psychology*, 1970 (May), Vol. 22(2), 305-317.—Trained 30 severely subnormal children to discriminate stimuli differing along 2 dimensions, both dimensions being relevant. Having learned to criterion Ss were then transfer-tested on each of the dimensions presented separately. Results show that Ss tended to respond in terms of dimensions and that slow learners tended to learn the discrimination in terms of only 1 dimension whereas faster learners tended to learn about both dimensions. In a further study with 68 Ss, it was found that the more difficult the discrimination to be made the more Ss tended to learn it in terms of only 1 of the 2 possible relevant dimensions. Some varying interpretations of the concepts of attention and capacity and their value and precision in explaining these results are considered. (15 ref.)—*Journal abstract.*

institutionalized retarded children. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4830.

1224. Joubert, Charles E. (U. Alabama) **Refractoriness in the reaction times of normal and retarded subjects as a function of uncertainty and response-stimulus interval duration and frequency.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5258-5259.

1225. Kellas, George & Butterfield, Earl C. (U. Kansas) **Response familiarization and the paired-associate performance of noninstitutionalized retarded and normal children.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 81-87.—Following relevant, irrelevant, or no pretraining with the response terms of a paired-associate (PA) task, 46 normal and 46 retarded children were compared on PA performance. Analyses of free-learning, PA correct responses, type of errors committed, and stage analysis all indicate that the PA deficit results partly from a decreased ability to learn the response terms of a PA task. The superiority of normal children was related to the earlier beginning point for the associative learning phase. Results are discussed in relation to previous research with normal adults and research within the retarded population.—*Journal abstract.*

1226. McKinney, James D. (North Carolina State U., Raleigh) **A developmental study of the acquisition and utilization of conceptual strategies.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5260-5261.

1227. Saxon, Samuel A. (U. South Carolina) **An investigation of the effect of two biological rhythms on reaction time in mentally retarded individuals.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5266.

1228. Shealy, Allen E. (U. South Carolina) **Changes in preference values of tokens as a function of pairing with incentives of different preference values and amount of pairing.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5243-5244.

1229. Stinnett, Ray D. & Prehm, Herbert J. (Eastern Oregon Coll.) **Retention in retarded and nonretarded children as a function of learning method.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 39-46.—Studied rote learning and retention performance as a function of method used in original learning and intellectual level. 60 retarded and 60 nonretarded junior-high and high-school students were randomly assigned to 1 of 3 treatment groups to learn a paired-associate task. Retention was assessed by immediate recall, 24-hr recall, and relearning scores. Data analysis indicates inferior learning performance and a 24-hr retention deficit for retarded Ss. The analysis also indicates that learning method influences results of comparisons of rote learning and retention in retarded and nonretarded Ss.—*Journal abstract.*

1230. Talkington, Larry W. & Hall, Sylvia M. (Austin State School, Tex.) **Matrix language program with mongoloids.** *American Journal of Mental Deficiency*, 1970 (Jul), Vol. 75(1), 88-91.—Took pre- and posttest measures on experimental (N = 20) and control (N = 20) groups of mongoloids matched on IQ and CA. Ss who received the Matrix language training made significant gains in the language and concept areas of sentences, total language, differences, similarities, missing parts, and total concepts. Results support the feasibility of such a procedure for the training of

language and concept formation in such a population.—*Journal abstract.*

1231. Warrick, Jeanne D. (U. Alabama) **Effects of stimulus pretraining and method of stimulus presentation on short-term memory processes of normals and retardates.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5270.

Training & Vocational Rehabilitation

1232. Hammarback, Marvin D. (U. Oregon) **An investigation of the Community Adaptation Schedule with educable mentally retarded adolescents and young adults.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4773-4774.

1233. Krieger, George W. (Michigan State U.) **An exploratory study of the effect of model-reinforcement counseling on the vocational behavior of a group of male retarded adolescents.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4776-4777.

1234. Wilkie, Earl A., et al. (Elwyn Inst., Pa.) **Developing a comprehensive rehabilitation program within an institutional setting.** *Mental Retardation*, 1968 (Oct), Vol. 6(5), 35-39.—Describes the process of changing a traditionally custodial institution into a comprehensive rehabilitation facility. Problems of changing staff attitudes and developing a program of rehabilitation services are reviewed. Methods of marshaling institutional and community resources to provide evaluation, exploratory work experience, trade training, remedial and community education, community work experience, placement, counseling and follow-up services are described.—*Journal abstract.*

PHYSICAL ILLNESS

1235. Badalyan, L. O., Tamarkina, É. D., Bondarenko, E. S., & Zakoshchikova, L. V. (2nd Moscow Medical Inst., USSR) **Izmenenie aktivnosti fermentov v myshechnoi tkani pri progressivnyushchikh myshechnykh distrofiyakh.** [Alteration of enzymatic activity in muscle tissue during progressive muscular dystrophy.] *Zhurnal Nevropatologii i Psikiatrii*, 1970 (Jan), Vol. 70(1), 72-76.—30 3-14 yr. old Ss with different forms of progressive muscular dystrophy (duration up to 13 yr.) were used to study (a) enzymatic activity (creatinphosphokinase, lactate and malate dehydrogenase) in affected muscle tissue, and (b) possible correlated changes in the clinical picture and course of the pathology. At first an increase in enzymatic activity was noted, followed by a tendency toward its decrease with growing severity of motor disorders. Maximal enzymatic activity was seen during the 1st years following the appearance of clinical symptoms. 16 Ss were drawn from 8 families. In these cases, among close family members in the normal category increased enzymatic activity was noted. Data indicate that enzymatic activity is a function of type of hereditary transmission. The highest indices of enzymatic activity were noted in patients with evidence of a recessive x-chromosomal type of transmission; less higher indices in those with autosomal-recessive and autosomal-dominant types. This reflects the hereditary heterogeneity of progressive muscular dystrophy and indirectly confirms the polygenic theory of the origin of this disease.—*I. D. London.*

1236. Billkiewicz, T. (Medical Academy, Gdańsk, Poland) **Total somatectomy and its psychopathological consequences.** *Polish Medical Journal*, 1969, Vol. 8(2), 481-493.—Considers the consequences that successive amputation of body parts and organs not essential to life may have for the human personality. It lies within the technical possibilities of modern surgery to obliterate the entire body, with the exception of the head, if what remains is subsequently coupled to a set of appropriate apparatus. The splanchnocranium and the organs of sense might be removed, leaving the brain, which would be kept alive according to the rules of tissue culture. This relic of man would preserve its personality, and compensate the absence of its body by means of a phantom body schema. Intellectual efficiency, affective life, memory of the past, even unproductive and nonmanifestable experiences of volition and aspiration would persist. In this regard, this human fragment would be superior to primitive living beings. If life is to continue in the sense of mnemosyneidesis, the tissular substrate of the reticular alerting system cannot be removed. In this fantastic backward reduction of man, the biochemical substrate will be reached which exists owing to uninterrupted metabolism. It is at this point that biochemical and neuro- and psychophysiological processes meet. However, no fantasy can solve the enigma of transition between the world of objective occurrences and that of subjective experiences. (28 ref.)—*Journal abstract*.

1237. Ford, R. Munro. (Royal Adelaide Hosp., South Australia) **Aetiology of asthma: A review of 11,551 cases (1958 to 1968).** *Medical Journal of Australia*, 1969 (Mar), Vol. 1(12), 628-631.—A review of asthma sufferers in S. Australia has shown that the dominant factors involved were extrinsic in 53.7% and intrinsic in 46.3% of all cases. In young children and in older adults, a much higher percentage of cases were in the intrinsic group, and in older children and in young adults, extrinsic causes predominated. Further analysis of these extrinsic causes showed that grass pollens and house dust were the 2 major factors involved. In this survey, 37.4% of patients showed a significant proportion of a combination of both extrinsic and intrinsic types of disease, which was particularly noticeable in the 5-14 and 45-59 yr. age groups, in which the type of disease seemed to be undergoing change. Many patients suffering from predominantly intrinsic disease also had extrinsic causes playing secondary roles in production of symptoms from time to time. A comparison of the types of asthma seen in 2 teaching hospitals (children's and adults') vs. those seen in private practice shows that a much higher incidence of the intrinsic type of asthma attended the hospitals as inpatients or outpatients, compared with that seen in private practice.—*Journal summary*.

1238. Katz, Jack L., Weiner, Herbert; Gallagher, T. F., & Hellman, Leon. (Montefiore Hosp. & Medical Center, Div. of Psychiatry, New York, N.Y.) **Stress, distress, and ego defenses: Psychoendocrine response to impending breast tumor biopsy.** *Archives of General Psychiatry*, 1970 (Aug), Vol. 23(2), 131-142.—Investigated by intensive interviews the adequacy of defenses of 30 women awaiting breast tumor biopsy. Criteria for adequacy were "affective state, functional intactness, and defensive 'reserve'." Hydrocortisone production rate was also obtained as a concurrent physiological measure of adequacy of defenses. Results show that the majority of Ss did not show significant

defensive breakdown. 6 types of defense patterns were noted: displacement, projection, denial, hope and prayer, stoicism-fatalism, and a combination of these. It is concluded that stressful situations are not equally distressful to all individuals, as the latter depends upon how the stress situation is understood, defended against, and perceived. (17 ref.)—P. McMillan.

1239. Kranz, Peter L. (Utah State U.) **A psychological investigation of seven hermaphroditic children.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5223.

1240. Pascall, M. Lo schock. [The shock.] *Difesa Sociale*, 1969 (Apr), Vol. 48(2), 237-244.—Discusses the definition, etiology, symptomatology, classifications, and pathogenesis of shock, in its overlap with other clinical conditions. Particular attention should be given to forms of medicament shock and its treatment, with special reference to the importance of prevention and therapy and the necessity for a more effective organization of emergency first-aid outside of hospitals.—L. L'Abate.

1241. Poznanski, Elva & Poznanski, Andrew K. (U. Michigan, Medical School) **Psychogenic influences on voiding: Observations from voiding cystourethrography.** *Psychosomatics*, 1969 (Nov), Vol. 10(6), 339-342.—Reviews technical aspects of voiding cystourethrography and examines the experiences of radiologists in completing the procedure. It was found that ability to void during the procedure is affected by the Ss' age and parity. "Difficulty begins with adolescence, peaks in late adolescence and starts decreasing in the thirties." The sex and experience of the examiner are also important. The behavioral responses to the inability to urinate are examined. It is concluded that a wide variety of psychological maneuvers which relax and distract the S increase the success rate.—G. Steele.

1242. Roxburgh, Peter A. (Foothills Hosp., Calgary, Alberta, Canada) **Treatment of persistent phenothiazine-induced oral dyskinesia.** *British Journal of Psychiatry*, 1970 (Mar), Vol. 116(532), 277-280.—Compares the features of persistent oral dyskinesia and functional oral movements. The literature on the drug control of oral dyskinesia is reviewed. In a double-blind interrupted cross-over trial in 2 established cases of oral dyskinesia, thiopropazate dihydrochloride was found to be highly effective.—*Journal summary*.

1243. Schoenberg, Bernard; Carr, Arthur C., Peretz, David, & Kutscher, Austin H. (Eds.) **Loss and grief: Psychological management in medical practice.** New York, N.Y.: Columbia U. Press, 1970. xi, 398 p. \$12.50.

1244. Weinstein, Sidney; Vetter, Robert J., & Sersen, Eugene A. (New York Medical Coll., Neuropsychological Lab.) **Phantoms following breast amputation.** *Neuropsychologia*, 1970 (Apr), Vol. 8(2), 185-197.—Of 203 women with unilateral mastectomy, 33.5% reported phantom of the missing breast. With left mastectomy, the incidence of phantom was significantly higher in younger women. Premenopausal women in general, regardless of age, also demonstrated a significantly greater incidence of breast phantom. The following significant results were obtained concerning the character of the phantom: (a) phantoms after left mastectomy appeared earlier than those after right; (b) the longer the neoplasm existed prior to mastectomy, the longer the subsequent phantom existed postoperatively; (c) older Ss at time of mastectomy retained phantoms longer; and (d) phantoms of the nipple were paresthetic more often than those of the

total breast, which were more frequently perceived as natural. Variables not significantly associated with phantom incidence included: (a) duration of preoperative breast neoplasm, (b) preoperative quality of breast sensations, (c) breast volume, (d) number of breast-fed children, and (e) time between mastectomy and interview. (French & German summaries) (18 ref.)—*Journal abstract.*

1245. **Wendkos, Martin & Wolff, Kurt.** (Veterans Administration Hosp., Coatesville, Pa.) **Emotional problems in patients with angina pectoris.** *Psychosomatics*, 1969 (Nov), Vol. 10(6), 334-338.—Compared psychiatric data from 13 patients with angina pectoris and 7 patients with rheumatic heart disease to determine whether Ss with angina pectoris exhibit specific psychological characteristics. It was found that anginal Ss exhibited a "distinctive premorbid psychodynamic pattern" consisting of "a combination of unfulfilled oral needs, repressed hostility, a highly developed superego, and an exaggerated degree of compulsiveness." The need for recognition by the physician of these elements for proper treatment is emphasized. 2 illustrative cases are included.—*G. Steele.*

COMMUNITY SERVICES

1246. **Jungjohann, Eugen E.** (U. Düsseldorf, Psychiatrische Klinik, W. Germany) **Patientenselektion zur Aufnahme in eine Tagesklinik als alternative zur stationären Behandlung in einem Landeskrankenhaus.** [Patient selection for acceptance in a day clinic as an alternative to institutionalization in a state mental hospital.] *Nervenarzt*, 1969 (Feb), Vol. 40(2), 82-87.—Discusses criteria for selection of patients for daily outpatient psychiatric care as an alternative to hospitalization. Ss with family difficulties, manic depressive psychoses, and psychoneuroses are deemed especially amenable to outpatient care, while psychotic depressives with suicidal fantasies, chronic brain syndrome patients, chronic alcoholics, drug addicts, and retardates are deemed unsuitable for daily outpatient psychotherapy. The program should be designed to provide maximum flexibility so that patients who do not appear to benefit from outpatient care can then be institutionalized.—*B. A. Stanton.*

1247. **Lees, A.** (Hounslow Child Guidance Centre, London, England) **Looking towards integration: Experiments by a child guidance centre.** *British Journal of Psychiatric Social Work*, 1968 (Spr), Vol. 9(3), 133-138.—Discusses the changing role and function of a child guidance clinic team, with emphasis on furthering specialist roles, improving organization, and sharing professional knowledge with other agencies. The efforts of 1 clinic to achieve extended coordination with allied specialties in the community are examined.

1248. **Ma, Helen & Edmonds, Carl.** (Drug Referral Centre, Rushcutters Bay, New South Wales, Australia) **Drug referral centre.** *Medical Journal of Australia*, 1969 (Aug), Vol. 2(6), 289-291.—Describes the concept and work of the Bayside Cottage Drug Referral Center. Those who attend are adolescents and young adults who have gravitated to the inner Sydney area and include drug use in their behavior pattern.—*Journal abstract.*

1249. **Millard, D. W.** (Rubery Hill Hosp., Birmingham, England) **The clinician in the community.** *British Journal of Psychiatric Social Work*, 1968 (Spr), Vol. 9(3), 124-129.—Explores the relationship of the psychiatrist to

the community and reviews limitations in primary prevention and opportunities in psychogeriatrics. Greater flexibility and decentralization of services are urged.

1250. **Rutherford, Thelma V.** (Health & Welfare Council, Information & Referral Service, Washington, D.C.) **Values of information, referral, and follow-up services.** *Rehabilitation Literature*, 1968 (Dec), Vol. 29(12), 363-364, 383.—Presents the objectives of Information and Referral Services (IRS) as: (a) "providing information, referral, followup, and limited 'specialized' services to individuals and agencies"; (b) expediting the institution of services rapidly and in "accordance with one's real need"; (c) evaluating and determining follow-up; (d) determining gaps in service; and (e) assisting "agencies in becoming familiar with availability of resources in the community." IRS is viewed as an agency in microcosm, exhibiting the problems presented in the community. Methods are demonstrated in 2 examples.—*G. Steele.*

GERIATRICS

1251. **Andres, Reubin.** (National Inst. of Child Health & Human Development, Baltimore City Hosp., Md.) **Physiological factors of aging significant to the clinician: Summary of remarks.** *Journal of the American Geriatrics Society*, 1969 (Mar), Vol. 17(3), 274-277.—Reviews misconceptions concerning the "biological pattern of life" common to most medical students which lead to a discrepancy in research advances on aging and progress in the introduction of this knowledge into medical school curriculum. Better S selection and longitudinal study techniques are suggested as partial solutions to the unreliability of many studies. The problem of standards of normality is discussed.—*G. Steele.*

1252. **Brackenridge, C. J. & McDonald, C.** (U. Melbourne, Victoria, Australia) **The concentrations of magnesium and potassium in erythrocytes and plasma of geriatric patients with psychiatric disorders.** *Medical Journal of Australia*, 1969 (Aug), Vol. 2(8), 390-394.—Groups of female geriatric patients with toxic confusional states, senile dementia (with subdivision according to parietal lobe function), and chronic schizophrenia were matched with mentally healthy persons with respect to number, sex, and age. Magnesium and potassium concentrations were measured in red blood cells and plasma of ill and control Ss. Significantly high intracellular potassium and less consistently raised magnesium levels were found in all psychiatric categories. In chronic schizophrenia, hypermagnesemia was also demonstrated. Possible reasons for these anomalies are considered. Strong linear correlations were observed between each of 3 variables: duration of institutionalization and erythrocyte potassium and water contents, in mentally normal persons and between the latter pair in 2 groups of demented patients. In senile dementia, Ss with preserved parietal lobe function had a higher mean age and corpuscular potassium and water content than those and nonconfused demented patients. (35 ref.)—*Journal abstract.*

1253. **Finch, A. J., Welsh, D. Kent; Haney, J. R., & Dinoff, Michael.** (U. Alabama) **Comparison of two versions of a minimal social behavior scale.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 985-986.—Administered to 16 geriatric patients, distinguished by different degrees of social behavior, the Minimal Social

Behavior Scale (MSBS) in its original and a modified form employing a time factor. Results demonstrate the usefulness of the MSBS in discriminating levels of social behavior and the increased sensitivity by adding a time factor weighting.—*Journal abstract.*

1254. Linn, Margaret W. & Gurel, Lee. (Veterans Administration Hosp., Miami, Fla.) **Initial reactions to nursing home placement.** *Journal of the American Geriatrics Society*, 1969 (Feb), Vol. 17(2), 219-223.—Over a 2-yr period 238 male patients transferred from a general medical hospital to nursing homes were studied prior to placement and 1 wk. later. Ratings of the Ss by nurses, according to a disability scale, indicate no significant changes in the level of disability by the end of the 1st wk. This applied not only to the whole group of patients but to 2 subgroups: those with favorable, and those with unfavorable attitudes toward nursing homes. Other criteria, i.e., death in the nursing home or readmission to the hospital, also indicate stability in the condition of the patients. It would seem that negative reactions are measurable only at some time later than 1 wk. after placement. It is recommended that rehabilitative or supportive efforts be offered early in nursing home placement.—*Journal abstract.*

1255. Shore, Herbert H. (North Texas State U.) **Measuring institutional adjustment of the geriatric population in homes for the aged.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5228.

EDUCATIONAL PSYCHOLOGY

1256. Adams, Henry L., Mason, Evelyn P., & Blood, Don F. (Western Washington State Coll.) **Personality characteristics of American and English, bright and average college freshmen.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 831-834.—313 students in 3 American colleges and 1 English grammar school completed 3 personality tests. Published norms for the tests appeared to be outmoded because of changes in student personality characteristics during the past decade. Results indicate that brighter students have more personal adjustment problems and are more independent.—*Journal abstract.*

1257. Atkins, Jan W. (U. Tennessee) **A forced choice-technique for determining reinforcement priorities of primary school children.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4820.

1258. Brody, Jozef. (U. Karlova, Prague, Czechoslovakia) **Error frequency: Regulator of the teaching algorithm.** *Kybernetika*, 1968, Vol. 4(6), 548-569.—Describes the mathematical formulation of the effectivity problem in the teaching process. The construction of a mathematical model of learning is presented. The resulting construction of the non-Markov algorithm is performed by means of an automatic computer. (Czech summary)—*Journal abstract.*

1259. Crown, Barry M. (Florida State U.) **An evaluation of selected cognitive and social dimensions in poverty intervention project participants.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4824.

1260. Etter, David C. (U. California, Los Angeles) **Adult learner characteristics and instructional objectives.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4754.

1261. Fiebert, Martin S. (California State Coll., Long

Beach) **The college classroom: Models of education—techniques for change.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 819-827.—Examined 3 models of education and the ideas of J. Farber and M. McLuhan to clarify some basic problems facing educators and students. Creative and courageous changes by individual instructors in their classrooms result in a more meaningful learning environment, increased satisfaction for teacher and learner, and greater role flexibilities resulting in more accurate personal perception and acceptance. Such changes could contribute to the modification of existing institutions. (27 ref.)—*Journal abstract.*

1262. Friedenberg, Edgar Z. (State U. New York, Buffalo) **The economic context of the student role.** *American Journal of Orthopsychiatry*, 1970 (Jan), Vol. 40(1), 47-52.—Education in our society could be viewed as a form of involuntary servitude in addition to being viewed as a form of investment in one's future. Students accept a marked decline in standard of living and forego earnings of some \$1000-4500 a yr. Their future gains, however, seem more clearly attributable to the credential they gain by acceptance of the student status than to demonstrable consequences of their educational experience. The notion of paying students to attend school is discussed.—*Journal abstract.*

1263. Frolova, O. N. K. Krupskaya o voprosakh pedagogiki. [N. K. Krupskaya on the problems of pedagogy.] *Doshkol'noe Vospitanie*, 1970 (Feb), Vol. 43(2), 95-98.—Presents a survey of selected writings of Lenin's wife on pedagogical theory and its realization in practice.—*J. D. London.*

1264. Goldin, Paul. **The school as resistant patient: A model for the participation of mental health professionals in reducing racial and ethnic tensions.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 146-152.—Describes the activities of a team of volunteer mental health professionals in a large urban junior high school who identified and ameliorated racial and ethnic tension. The problems encountered and the methods evolved to deal with them are explicated.—*H. Kaczowski.*

1265. Leclair, Lowell V. (Michigan State U.) **A study of the relationship of three factors—perceived need deficiency, importance of need fulfillment, perception of education as a mobility facilitator—to participation in educational activities.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4756-4757.

1266. Leveque, Kenneth L. & Walker, Ronald E. **Correlates of high school cheating behavior.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 159-163.—Studied the correlates of cheating behavior of 336 high school boys on a geometry test. Results support the general findings of previous investigations, i.e., students when given the opportunity will tend to cheat. Teacher ratings of student honesty and cheating score correlated at .42, $p < .01$.—*H. Kaczowski.*

1267. Mindlina, T. **Obuchenie i podgotovka detei k shkole vo Frantsii.** [Teaching and preparation of children for school in France.] *Doshkol'noe Vospitanie*, 1970 (Jan), Vol. 43(1), 94-98.—Critically discusses the French preschool situation and that of the 1st yr. ("the preparatory grade") in the elementary school. Official psychological and pedagogical assumptions are questioned.—*J. D. London.*

1268. Muller, Sarah D. & Madsen, Charles H. **Group desensitization for "anxious" children with reading**

problems. *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 184-189.—Assigned 28 7th graders (16 boys; 12 girls, mean age = 12.8) to either a desensitization group or a reading placebo group. As a general finding, the placebo treatment was as effective in reducing reports of behaviors generally called anxiety. It is concluded that "reading anxiety was perhaps more amenable to 'in vivo' rehearsal without relaxation."—H. Kaczkowski.

1269. Nevskii, V. *Literatura po doshkol'nomu vospitaniyu*. [Literature on preschool education.] *Doshkol'noe Vospitanie*, 1970 (Feb), Vol. 43(2), 127-128.—Presents a list of Soviet publications appearing in the 2nd quarter of 1969, although date of publication in some cases is earlier than 1969.—I. D. London.

1270. Samorukova, P. O znakomlenie detei o prirodoi po metodu E. I. Tikhevoi. [Acquainting children with nature by the method of E. I. Tikheeva.] *Doshkol'noe Vospitanie*, 1970 (Jan), Vol. 43(1), 44-47.—Discusses the views of E. I. Tikheeva on the role of nature in preschool training, as presented in her various publications in the 1920s.—I. D. London.

1271. Sax, Arnold B. (U. Houston) A comparative study of personality characteristics between seventh-grade students classified as educationally deprived and non-educationally deprived. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4838.

1272. Schutz, Richard E. Computer-assisted educational research (CAER). *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 108-111.—Describes the characteristics of the CAER system whose purpose is to select a problem, design the study, and analyze the data.—H. Kaczkowski.

1273. Smirnov, A. A. (Ed.) *Voprosy detskoj i pedagogicheskoj psikhologii na XVIII Mezhdunarodnom kongresse psikhologov*. [Problems of child and pedagogical psychology in the 18th International Psychological Congress.] Moscow, USSR: Prosveshchenie, 1969. 256 p.—Presents a collection of 4 survey articles, covering and critically assessing the various papers on child and pedagogical psychology read at the 1966 Congress held in Moscow. Included is a glossary of technical terms.—I. D. London.

ATTITUDE & ADJUSTMENT

1274. Betz, E. L., Klingensmith, J. E., & Menne, J. W. (Iowa State U.) The measurement and analysis of college student satisfaction. *Measurement & Evaluation in Guidance*, 1970, Vol. 3(2), 110-118.—Analyzed the development and current status of the College Student Satisfaction Questionnaire as part of a project directed at the systematic study of college student satisfaction as an analog to job satisfaction. Construct validity was suggested by analysis of covariance results indicating that type of residence and year in school, but not sex, were significantly related to scores on several satisfaction dimensions.—S. M. Amatora.

1275. Centra, J. A. & Linn, R. L. (Educational Testing Service, Princeton, N.J.) On interpreting students' perceptions of their college environments. *Measurement & Evaluation in Guidance*, 1970, Vol. 3(2), 102-110.—Explored the relationships between student-perceived college environment as measured by the College and University Environment Scales (CUES) and objective institutional characteristics. CUES scores for 75 colleges were related to college mean scores of

entering freshmen on the Scholastic Aptitude Test, sex composition of students in attendance, religious affiliation, and size of entering class. Although multiple correlations were all relatively high, there was substantial variance on the 5 CUES scales not predictable from the set of 5 institutional characteristics.—S. M. Amatora.

1276. Densch, Berthold & Garth, Julia. A multidisciplinary approach to truancy. *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 194-197.—Describes the multidisciplinary team approach used to attack attendance problems in Chicago's public elementary schools.—H. Kaczkowski.

1277. Golding, Eugene B. (Mississippi State U.) An analysis of the utilization of video-tape and still-camera activities on personality adjustment of selected seventh grade students. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4718-4719.

1278. Hirsch, Steven J. & Keniston, Kenneth. (Northern Virginia Mental Health Inst., Falls Church) Psychosocial issues in talented college dropouts. *Psychiatry, Washington, D.C.*, 1970 (Feb), Vol. 33(1), 1-20.—40 Yale undergraduates were studied throughout a period during which they were deciding whether or not to continue college. 31 of the Ss did eventually drop out. 25 of the 40 Ss were interviewed and the others were assessed from Health Service records. In all cases dropping out was a serious decision involving a crisis situation. The major areas of psychosocial problems were seen to be: (a) problems in identification with the father, (b) disengagement from academic involvements in response to conflict, and (c) transference of family conflict to the institution as a parentis in locis (exacerbated by the fact that student attendance at Yale tends to be in the "family tradition"). Dropouts were also seen as being developmentally out of phase with the college's demands on their maturity. (30 ref.)—E. Uprichard.

1279. McDaniel, Norman H. (North Texas State U.) Factors relating to personal-social adjustments of first- and second-grade children in self-contained and term-teaching classrooms. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5226.

1280. Phillips, Gerald M. (Pennsylvania State U.) Student attitudes and moods. *Acta Symbolica*, 1970 (Spr), Vol. 1(1), 31-46.—Describes the use of an extracurricular free self-expression procedure to encourage communication with instructors. The reflection in these "ramblings" of changes in student attitudes and moods over 5 yr. is discussed. The most important single characteristic of college students seems to be a paradoxical preoccupation with the impact they make on others coupled with a concern for self-realization. A collection of 33 examples of these student writings is included.—M. Cynamon.

1281. Rubin, Dorothy. (Trenton State Coll.) Halo effect in self-rated attitudes of certain black college freshmen. *Psychological Reports*, 1970 (Jun), Vol. 26(3), 940.—Administered a survey of study habits and attitudes to 29 Negro undergraduates enrolled in a required noncredit, developmental reading course. All extreme responses were isolated to determine whether any patterns existed among Ss' definite responses. Ss' replies were almost diametrically opposite to their observed behavioral patterns, indicating Ss were answering in ways Ss felt were the expected direction, thus exhibiting a pronounced halo effect.—Author abstract.

1282. Sanford, Edward W. & Seiders, Nancy D.

Change in value status of elementary school children after introduction to a value-oriented rationale. *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4837-4838.

1283. Soares, Louise M. & Soares, Anthony T. **A study of students' sex attitudes and teachers' perceptions of students' sex attitudes.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 172-174.—75 disadvantaged high school students were given a special unit of instruction on sex. Results indicate that the training sessions changed the sex attitudes of the students. Middle-class teachers perceived quite accurately the sex attitudes of disadvantaged students.—H. Kaczowski.

TESTING

1284. Carpenter, James B. (Purdue U.) **The effects of multiple-choice test item format on test validity.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5272.

1285. Connett, William E. (Southern Illinois U.) **The relationship of selected personological, context, and focal stimulus variables to cognitive test performance: A theoretic framework and experimental study.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4823-4824.

1286. Efron, Marvin. (U. South Carolina) **The influence of communication ability on the incidence of over-referral in the use of the school vision tester.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4825.

1287. Maier, Norman R. & Casselman, Gertrude G. (U. Michigan) **The SAT as a measure of problem-solving ability in males and females.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 927-939.—Attempted to determine (a) the relationship between mental operations involved in solving 5 insight problems and those used in taking the Scholastic Aptitude Test (SAT), and (b) whether the sex difference in problem-solving performance is still present in undergraduates when SAT scores are equated. 264 male and 210 female Ss were tested. It was found that the SAT Math scores were correlated with problem-solving ability for both sexes, while the SAT Verbal showed little correlation for either sex. All problems contributed to the Math form correlation. Females scored significantly lower than males on the Math form and on the insight problems but did equally well on the Verbal. Matching of scores on the Math form did not remove the sex difference in problem-solving ability. When these scores were divided into subgroups by level, females with high Math scores were responsible for most of the male-female difference in problem solving. Further analysis to determine reasons for this sex difference suggested a qualitative difference in cognitive style as opposed to differential motivation. Females seem to rely relatively more on recall and males on problem solving when taking the SAT Math. (18 ref.)—*Journal abstract*.

1288. Souren, Grégor; van der Kloot, Wim, & van Bergen, Annie. **Proefleiders zonder pl-verwachtings-effect.** [Examiners without the "examiner-expectation" effect.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970 (May), Vol. 25(5), 324-325.—Reports on the effect of the expectation of the examiners on the performance of the testees. It reported that the

expectations of the examiners had no effect on the performances of those examined.—A. J. Ter Keurst.

1289. Waugh, Douglas & Moyse, C. A. (Dalhousie U., Halifax, Nova Scotia, Canada) **Medical education. II: Oral examinations: A videotape study of the reproducibility of grades in pathology.** *Canadian Medical Association Journal*, 1969 (Apr), Vol. 100(14), 635-640.—Investigated the ability of oral examinations to predict performance by examining individual videotape interviews of 8 medical students by 11 examiners. Results indicate wide divergency and lack of consistency with the exception of Ss' near the top of the class. Ss' perceptions of their own behavior on the videotapes was discussed. It is concluded that "the oral examination can provide the opportunity for the assessment of student characteristics not easily evaluated by other means."—G. Steele.

SPECIAL EDUCATION

1290. Alper, Theodore G. (U. Oregon) **A comparison of two treatment approaches for the behavior problems of elementary school children.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4762.

1291. Boskis, R. M., Vlasova, T. A., Rozanova, T. V., & Shif, Zh. I. **Problemy psikhologii anomal'nykh detei.** [Problems in the psychology of nonnormal children.] In A. A. Smirnov (Ed.), *Voprosy detskoi i pedagogicheskoi psikhologii na XVIII Mezhdunarodnom kongresse psikhologov.* (See PA, Vol. 45:1) 184-251.—Presents a critical survey of the papers read at the Congress on "special psychology," investigating the influence of sensory defects, speech disorders, and mental retardation on psychological development in children.—I. D. London.

1292. Furneaux, Barbara. **The special child.** Baltimore, Md.: Penguin, 1969. 208 p. \$1.25(paper).

Gifted

Remedial Education

1293. Graeme, Sharron C. & Harris, Mary B. (U. New Mexico) **Improving word recognition in retarded readers.** *Reading Teacher*, 1970 (Feb), Vol. 23(5), 418-421, 464.—To determine the efficacy of instructing retarded readers in the use of dictionary pronunciation symbols, 20 4th graders reading at least 1 yr. below grade level were randomly assigned to 1 of 2 groups. The control group was told that increased oral reading would facilitate word pronunciation, and each S read aloud during sessions. The experimental group received instructions in 4 approximately equal phases: presentation of symbols, finding pronunciations, group attempts to pronounce, and individualized pronunciations. Both groups received 4 wk. of daily 15-min sessions. Pre-and posttests on a list of 20 multisyllable words selected from the Ginn Reading Series indicate that both groups increased significantly in mean number of correct and attempted words, while the experimental group significantly improved over the control group only in mean words attempted. It is suggested that since both groups significantly improved, a combination of the 2 methods might prove most effective.—R. Wiltz.

1294. Ingram, T. T., Mason, A. W., & Blackburn, I. (U. Edinburgh, Scotland) **A retrospective study of 82**

children with reading disability. *Developmental Medicine & Child Neurology*, 1970 (Jun), Vol. 12(3), 271-281.—Studied 82 dyslexic children, 66 boys and 16 girls, preselected so as to be without adverse home environment, interrupted schooling, low IQ, or poor motivation. The most severe reading disability could exist without neurological evidence of brain damage, and when brain damage was evident the dyslexia was more often associated with backwardness in other school subjects.—P. W. Pruyser.

1295. Radin, Norma. (U. Michigan, School of Social Work) **Some impediments to the education of disadvantaged children.** *Children*, 1968 (Sep), Vol. 15(5), 170-176.

1296. Weithorn, Howard B. (U. Southern California) **The functional aspects of Adlerian constructs in understanding and assisting disadvantaged children.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4786.

Sensory & Physical Handicaps

1297. Avery, Constance D. (Connecticut Inst. for the Blind, Hartford) **A psychologist looks at the issue of public vs. residential school placement for the blind.** *New Outlook for the Blind*, 1968 (Sep), Vol. 62(7), 221-226.—Discusses the social and academic advantages and disadvantages of public vs. residential school placement for the legally blind.

1298. Eachus, Herbert T. (U. Massachusetts) **The effects of token reinforcement and verbal remediation on the rate, accuracy, and length of sentence composition by deaf children.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4825.

1299. Franks, Frank L. & Nolan, Carson Y. **Development of geographic concepts in blind children.** *Education of the Visually Handicapped*, 1970 (Mar), Vol. 2(1), 1-8.—"Blind students' need for knowledge in discrimination of forms, textures and symbols used in embossed maps has given direction and emphasis to this research." 2 studies were conducted to examine blind students of various ages and grade levels knowledge of directional and geographical concepts. Under directional concepts, most Ss mastered the concept of right and left, yet were less knowledgeable in the concept of north, south, etc. (although sufficiently knowledgeable). Under the geographical concepts, Ss given a list of 70 terms to define and describe showed far less ability than in the previous study. It is concluded that: (a) higher scores at some grade levels appeared to be a result to repetition of terms in curriculum content, (b) increased repetition contributed to higher overall gains, although short-lived, and (c) much repetition and reintroduction of terms produced higher scores which diminished noticeably over relatively short periods of time.—P. Shibelski.

1300. Lewis, Marian. (Tennessee School for the Blind, Donelson) **Must visually handicapped students be low achievers in math?** *Education of the Visually Handicapped*, 1970 (May), Vol. 2(2), 60-61.—Although blind students have proven their ability to compete with sighted students in literary subjects, they seem to show consistently lower scores (up to 20% lower) in mathematics. A study of apparatus used for calculation in Braille classes was conducted to determine the most efficient type and to aid in improving of apparatus and methods. A survey was conducted to ascertain the various apparatus and methods used in both public and

residential school, which revealed a great diversity of apparatus and teaching methods. There appeared to be no uniform method or level at which various methods and apparatus were used. The principal means of calculation was the Braillewriter, but the cubarithm slate, Crammer abacus, etc. were also utilized. More differentiation in testing methods and further study was advised.—P. Shibelski.

1301. Romig, Denise A. & Van Atta, Ralph E. (New Mexico School for the Visually Handicapped, Alamogordo) **A validity study of the "Adolescent Emotional Factors Inventory."** *Education of the Visually Handicapped*, 1970 (May), Vol. 2(2), 38-46.—Investigates the validity of the Adolescent Emotional Factors Inventory (AEFI), developed by M. Bauman, H. Platt, and S. Strauss, as an indicator/predictor of adjustment or maladjustment of visually handicapped youths to school. The AEFI is comprised of 10 scales: Sensitivity, Somatic Symptoms, Social Competency, Attitudes of Distrust, Family Adjustment, School Adjustment, Morals, Attitudes about Blindness, and Validation. The AEFI was administered to 155 blind adolescents (mean age = 16). Results are presented in the form of the intercorrelation matrix of the 9 subscales. All intercorrelations were significant (.01 level), indicating that the AEFI is affective for assessment of adjustment and maladjustment in visually handicapped adolescents.—P. Shibelski.

1302. Steele, Nancy W. (George Peabody Coll. for Teachers) **Learning by blind children of low ability: The relative efficiency of reading and listening.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4840-4841.

Mental Retardation & Learning Disorder

COUNSELING & GUIDANCE

1313. Brewer, Ted E. (North Texas State U.) **Relationships among individual short-term counseling, academic achievement, personality factors, and college persistence of certain junior college students.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4765-4766.

1314. Ellison, Martha. (Kentucky Dept. of Education, Frankfort) **The counselor as seen by a curriculum development specialist.** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 66-72.—Considers the various roles of the counselor defined as "that person within the full-time staff of the school who is charged with helping pupils in an organized way in selecting and interpreting their experiences, in the formation of healthy attitudes, and in their growth toward intellectual, emotional, moral, and physical maturity."—*P. McMillan*.

1315. George, Flavil H. (North Texas State U.) **The relationship of the self concept, ideal self concept, values, and parental self concept to the vocational aspiration of adolescent Negro males.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4772.

1316. Grace, Evelyn R. (North Texas State U.) **The relationship between personality traits and vocational interests in the choice of field of study of selected junior college students in business administration.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4827.

1317. Hull, Joshua S. (Michigan State U.) **An investigation of identification of male college students with their fathers as a variable influencing vocational interests and vocational counseling.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4775.

1318. Jansen, D. G. & Robb, G. P. (Ft. Worth Psychological Services Center, Tex.) **Differences between counseled and non-counseled students on the MMPI.** *Journal of Clinical Psychology*, 1970 (Jul), Vol. 26(3), 391-393.—56 male and 59 female matched pairs of counseled and noncounseled university students were compared on the basis of MMPI scores. Counseled males and counseled females had significantly higher scores on all but 3 and all but 4 MMPI scales, respectively. Counseled Ss had a greater incidence of MMPI scores 2 or more standard deviations above the mean. It is suggested that the maladjustment of the counseled students cannot be easily dismissed and the college counselors might be involved to a greater degree with clients suffering serious emotional difficulties than is widely assumed.—*E. J. Kronenberger*.

1319. Kondrat'eva, L. L. & Klimov, E. A. **Pervoe vsesoyuznoe soveshchanie po voprosam profilaktitsii i profkonsul'tatsii v shkole.** [First All-Union Conference on Problems of Vocational Counseling in Schools.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 178-180.—Presents the proceedings of a 1969 meeting held in Leningrad. Summaries of the 203 papers presented appeared in a special publication.—*L. Zusne*.

1320. Mechanick, Phillip, et al. (U. Pennsylvania, Medical School) **Concepts in university mental health services.** *JAMA*, 1969 (Jun), Vol. 208(13), 2453-2456.—A group of medical students under faculty supervision has developed an experimental advisory service to assist troubled college students who are reluctant to seek formal psychiatric care because of fears of its "stigma," suspicion of university administration, and/or a belief that older professional personnel cannot understand the problems of their generation. Walk-in centers ("talking points"), located at strategic areas on campus, are manned during key hours. Complete anonymity of contacts is guaranteed. Psychiatric staff members hold regular supervisory sessions to review cases. In the 1st 14 wk. of operation, 71 clients (1% of the undergraduate population) were seen. Problems have included depression, social maladjustment, incipient psychosis, fear of pregnancy, and suicidal attempts. Clients requiring professional care are referred.—*Journal abstract*.

1321. Miller, F. T., Pinkerton, Rolff S., & Hollister, W. G. (U. North Carolina) **An "action-facilitation" entry pattern of mental health consultation.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 359-362.—Describes a program of school mental health consultation in which the consulting team initiates the program rather than responding to invitation. Such a requirement entails developing sanctions to consult, obtaining points of entry into the consultee's system, and devising flexible operating approaches. The program focuses on the importance of preventive mental health, continuous rather than short-term orientation, and the consultant as a helper rather than an administrator within the system.—*P. McMillan*.

1322. Nelson, Dennis E. & Jones, G. Brian. **Selected guidance system components related to instruction.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 153-158.—Describes a design for a comprehensive guidance system which will be an integral part of an individualized education system. A number of developmentally oriented components are explicated and explained. The "personal problem solving behaviors" component has been selected for initial study and program development.—*H. Kaczowski*.

1323. Salim, Mitchell. (West Irondequoit Central School District, New York) **Program development via a guidance model.** *Counselor Education & Supervision*, 1968 (Fall), Vol. 8(1), 61-65.—Presents results of a 2-yr study on the "role and contribution of the school counselor as it relates to the school's concern for motivation, under-achievement, and other all-school problems."—P. McMillan.

1324. Snyder, Benson R. & Kahne, Merton J. (Massachusetts Inst. of Technology) **Stress in higher education and student use of university psychiatrists.** *American Journal of Orthopsychiatry*, 1969 (Jan), Vol. 39(1), 23-35.—Reports demographic and personality characteristics of student users and nonusers of a college psychiatric service. Techniques used to clarify the importance of the social structure of the college environment in stressing, shaping, or retarding the intellectual and emotional development of its students are described.—*Journal abstract*.

PERSONNEL

1325. Carson, Mary R. (U. Washington) **A descriptive study of roles: Elementary school counselors, psychologists, and social workers.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4767.

1326. DiGiorgio, Anthony J. (Purdue U.) **Discriminant function analysis of measured characteristics among committed career groups with requisite graduate training.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4769-4770.

1327. Galhoff, Peter E. (Purdue U.) **An analysis of the personal and situational factors influencing school counselors' career patterns.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4771-4772.

1328. Hyman, Irwin A. (Temple U.) **The traineeship in school psychology: A report on growth and growing pains.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 351-353.—Examines problems involved in field placements for trainees in school psychology, including inadequate role definition and supervision, and inappropriate selection of training sites. The merits of the university model are presented with the conclusion that this model may be the most effective for training in school psychology.—P. McMillan.

1329. Lindstrom, Allan R. (U. Denver) **Identifying characteristics and role perceptions of two-year college counselors.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4778-4779.

1330. Malley, Patrick B. (U. Pittsburgh) **The relationship of selected personality variables to employment as a school counselor and persistence in graduate education.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4779-4780.

1331. Roberts, Robert D. **Perceptions of actual and desired role functions of school psychologists by psychologists and teachers.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 175-178.—Obtained 135 school psychologists' and elementary school teachers' perceptions of the role functions of a school psychologist by means of a questionnaire. Results show that psychologists and teachers report considerable diversity in the functions performed and responsibilities assumed by the school psychologist. The same type of discrepancy exists between the 2 groups when the ideal function is examined. School psychologists report they should be

more involved in the mental hygiene role.—H. Kaczowski.

1332. Weick, Ray K. (North Carolina State U.) **A study of personal values and their relationship to perception of organizational elements.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4761.

Teachers & Teacher Training

1333. Barnett, S. A. (U. Glasgow, Scotland) **The "instinct to teach."** *Nature*, 1968 (Nov), Vol. 220(5169), 747-749.—Considers whether teaching is a prerogative of man by deciding what behavior can be accepted as teaching in another species. The concept of teaching contains the notion that the teacher's behavior is guided by the pupil's performance. Teaching seems to occur when an animal is punished for approaching or obstructing another. Other kinds of teaching are aided by imitation, or learning by observation. The ontogeny of imitation on and of teaching among human beings is suggested for further study. (27 ref.)—*Journal abstract*.

1334. Barrett, Thomas C. (North Carolina State U.) **Relationship between perceived faculty participation in the decision-making process and job satisfaction in the community colleges of North Carolina.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4821-4822.

1335. Bond, Patricia Y. (North Texas State U.) **The effects of feedback on teachers' verbal behavior and attitudes toward in-service education.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4850.

1336. Brown, William E. (Indiana U.) **The influence of student information on the formulation of teacher expectancy.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4822-4823.

1337. Bruce, Larry R. (Michigan State U.) **A determination of the relationships among SCIS teachers' personality traits, attitude toward teacher-pupil relationship, understanding of science process skills and question types.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4850-4851.

1338. Buckley, Eugene F. (North Texas State U.) **The relationship between student-teacher perceptions and pupil perceptions of the student teacher.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4672-4673.

1339. Harris, Albert J. **The effective teacher of reading.** *Reading Teacher*, 1969 (Dec), Vol. 23(3), 195-204.—Discusses characteristics of the effective reading teacher and reviews the related research. Findings suggest that supervisor ratings of teachers do not significantly correlate with student improvement, and that a more acceptable, though incomplete, criterion would be student improvement on achievement tests. Other findings indicate that the effective teacher: (a) uses mild rather than harsh criticism; (b) has an unemotional, quiet tone of voice; (c) engages in frequent verbal interaction with pupils; and (d) asks a variety of questions. Studies also indicate that the beginning teacher might become more effective through training in micro-teaching, programed tutoring, or self-criticism of recorded lessons. It is suggested that teachers might be kept enthusiastic and interested if encouraged to try new ways of increasing their own effectiveness. (18 ref.)—R. Wiltz.

1350. Kennedy, W. A. (Florida State U.) **A follow-up normative study of Negro Intelligence and achievement.** *Monographs of the Society for Research in Child Development*, 1969, Vol. 34(2), 40.—Presents "a reassessment of a representative sample of the stratified, random sample of 1,800 Negro elementary school children who were tested in the fall of the 1960 academic year. The mean of the Stanford-Binet, Form L-M, in 1960 was

79.2; in 1965 it was 79.4, a nonsignificant change. The standard deviation in the sample increased from 12.6 in 1960 to 14.3 in 1965, and the range in scores increased slightly. Although there was a tendency for the IQs to remain constant across grade level, as had been observed in 1960, there was again the obvious decline in IQ associated with chronological age.... The California Achievement Test data revealed a continuation of the trend, so clearly noticed in 1960, for Negro children to continue to fall behind academically, such that the amount of retardation at the 10th grade level is severe. Although the number of dropouts in the sample thus far has been small, nevertheless the children are clearly in serious academic difficulty when compared with the national normative sample."—*A. Barclay*

1351. Laurent, James A. (U. Oregon) **Effects of race and racial balance of school on academic performance.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4831.

1352. Little, Ellis & Nowell, Gadis. (U. Illinois, Chicago Circle) **Integration and scholastic performance: A pilot study of Chicago public high school graduates attending the University of Illinois, Chicago.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 887-891.—Examined GPAs of 897 white undergraduates representing 25 urban public high schools. Socioeconomic status and individual ability were considered. The scholastic performance of Ss who attended integrated high schools was compared with that of Ss who attended white-segregated high schools. With no refinement as to ability or socioeconomic status, Ss from integrated high schools performed as well as Ss who attended white-segregated high schools. However, when the above average ability—above average socioeconomic status groups—are compared, findings are barely significant (if $p = .05$). The question of whether there is some suppression of achievement associated with attendance at an integrated high school is raised.—*Journal abstract.*

1353. Niskanen, Erkki A. (U. Helsinki, Inst. of Education, Finland) **School achievement and personality: Description of school achievement in terms of ability, trait, situational and background variables: III. Operations at the factor level.** *Research Bulletin, U. Helsinki, Institute of Education*, 1968, No. 23, 39 p.—Describes the method-centered portion of a series of studies on school achievement as follows: (a) structure of school achievement, (b) relation to selected personality variables, and (c) application of multidimensional statistical operations. Ss were citizenship school pupils (compulsory school yr. 7 and 8), and included approximately 168 boys and girls. "The information provided by correlation coefficients, factor analyses, congruence coefficients and canonical analyses can be employed to describe school achievement in terms of the personality variables included in the study. The content of this information is presented in Part IV of the study." (53 ref.)—*P. McMillan*.

1354. Reimanis, Gunars. **Teacher-pupil interaction and achievement striving in the kindergarten.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 179-183.—Observed the achievement behavior of 45 kindergarten boys who had been rated as to their degree of internal reinforcement control (IRC). The achievement striving of high IRC boys was significantly related to the ratio of teachers' approval over disapproval. Low IRC boys needed frequent positive approval to become achievement oriented.—*H. Kaczowski*.

1355. Schowengerdt, George C. (U. Missouri) **The relationship of student and instructor PAS type to student achievement in calculus.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5228.

1356. van der Linden, F. J. (Hoogveld Inst., Nijmegen, Netherlands) **Intelligentie en school-prestaties van jonge schoolkinderen.** [Intelligence and scholastic performance of young schoolchildren.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970 (May), Vol. 25(5), 278-301.—Ss were 89 6-7 yr. old 1st graders, almost equally divided between the sexes. The translated forms of the Terman-Merrill Intelligence Test, the Science Research Associates Primary Abilities Test, and the Raven Coloured Progressive Matrices measured intelligence. School performance was tested by achievement tests standardized in the Netherlands. 6 factors with loadings above .40 were identified by factor analysis: school achievement, verbal reasoning, space insight, numerical values, "practical" thinking, and "elementary" understanding. The results of the testing of Dutch children on the intelligence tests were comparable to those of American children. No definite conclusions could be given about the generality or specificity of intelligence factors among the Ss. No special verbal and memory factors were evident. (28 ref.)—A. J. Ter Keurst.

Prediction

1357. Biggs, D. A., Roth, J. D., & Strong, S. R. (U. Minnesota) **Self-made academic predictions and academic performance.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(2), 81-86.—Attempted to identify and measure self-made academic predictions of entering college freshmen. Scores on the College Opinion Survey (COS) were related to high school rank (HSR), GPA for 1st quarter in college, Scholastic Aptitude Test (SAT) scores, and scores on the Academic Achievement scale of the SVIB. COS scores were most significantly related to past performance (HSR). Self-made academic predictions did not increase multiple correlation predictions of GPA beyond that obtained with SAT, HSR, and Academic Achievement.—S. M. Amatora.

1358. Blue, Arthur W. (Iowa State U.) **Prediction of learning ability across culture.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5220.

1359. Gropper, Robert L. (George Peabody Coll. for Teachers) **Comprehension of narrative passages by fourth-grade children as a function of listening rate and eleven predictor variables.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4827.

1360. Khan, S. B. (Ontario Inst. for Studies in Education, Toronto, Canada) **Affective correlates of academic achievement: A longitudinal study.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(2), 76-80.—A modified version of the Survey of Study Habits and Attitudes (SSHA) was administered to students in the 8th grades of 3 junior high schools. Factor scores obtained from factor analysis of the interitem correlations were used separately and in conjunction with aptitude measures to predict achievement scores obtained 4 yr. later. When cross-validated on new samples, the regression weights did not hold for predicting performance in natural science and mathematics for the new male sample. The attitudinal predictors did not significantly increase any multiple correlation for males and increased only 1 correlation for

females when used in conjunction with aptitude measures.—S. M. Amatora.

1361. Owen, Steven V., Feldhusen, John F., & Thurston, John R. (Purdue U.) **Achievement prediction in nursing education with cognitive, attitudinal, and divergent thinking variables.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 867-870.—Attempted to determine whether 2 attitude measures, designed for prediction of achievement in nursing education, and a set of divergent thinking (DT) tests could increase the predictive efficiency of an established set of cognitive measures. Data were gathered from 5 schools of nursing. A set of cognitive predictor variables was used as the basic prediction battery. The following attitudinal and DT tests were used: Nurse Attitudes Inventory (NAI), Nursing Sentence Completions (NSC), Consequences, Alternate Uses, and a creativity self-rating scale. Criteria were 7 semester and cumulative grade averages. Separate multiple regression analyses were used to find the optimum sets of predictors within each of the 4 sets of measures. Each attitudinal and DT optimum set was then combined with the optimum cognitive set to determine the increase in predictive efficiency beyond the optimum cognitive set alone. The multiple correlations were significantly increased for 3 criteria when the optimum divergent thinking variables, the NAI, and the NSC were added to the optimum cognitive sets of predictors.—*Journal abstract.*

1362. Ramos, Robert A. (U. Tennessee) **An investigation of the effect of moderator variables on the regression and factor structure of predictors and criteria.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5275.

1363. Reynolds, Richard J. & Hope, Amy G. (U. Georgia) **Typology as a moderating variable in success in science.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 711-716.—Examined a Myers-Briggs Type Indicator (MBTI) for its utility as a predictor of intellectual behaviors. For 158 beginning, 168 intermediate, and 58 advanced high school students measures of GPA, IQ, and science achievement and aptitude were obtained. MBTI subscales were dichotomized and criteria were analyzed relative to the resultant 8 groups. MBTI subscales provided evidence that typology may well be a moderating factor in intellectual performance. The intuition scale indicated typological differences moderating performance. MBTI was more appropriate for heterogeneous groups and lost its discriminatory utility with homogeneous groups.—*Journal abstract.*

1364. Szabo, Michael. (Purdue U.) **The relationship of intellectual, personality, and biographical variables to success and its prediction in an independent study science course at the college level.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4845-4846.

Overachievement & Underachievement

CURRICULUM & PROGRAMS

1365. Anderson, Richard J. (U. Florida) **Stability of student interests in general psychology.** *American Psychologist*, 1970 (Jul), Vol. 25(7), 630-632.—Interests of psychologists changed from pre- to post-World War II, as recognized in P. H. Kriedt's restandardization of the Psychologist scale on the SVIB. In 1951, the

preferences of 129 psychology students were established by rank-ordering 10 subtopics. The stability of the pattern was checked by administering the same questionnaire to 162 students in 1968 under similar conditions. Median ranks were almost identical. Personality and adjustment was most preferred at 2.5 in 1951 and 2.6 in 1968. The nervous system and glands ranked lowest at 7.3 in 1951 and 7.5 in 1968. Order of preference correlated .915. It is concluded that although the interests of psychologists and psychology students have changed markedly between the pre- and post-World War II periods, the preferential interests in the 10 topic areas compared show very high stability from 1951-1968.—*Author abstract.*

1366. Artley, A. S. (U. Missouri) **The teacher variable in the teaching of reading.** *Reading Teacher*, 1969 (Dec), Vol. 23(3), 239-248.—Argues that despite the large number of studies on reading methods, reading improvement "does not appear to be a function solely of approach or method." Research on teacher effectiveness has also been disappointing because: (a) the teacher, rather than the reading teacher, has been focused upon; (b) procedures, course content, and understanding and commitment of the teacher have not been studied; and (c) changes in pupil behavior have only been indirectly studied. To provide the necessary information, a series of studies are proposed which would: (a) formulate a concept of reading maturity, (b) decide how to measure the correlates of reading growth, (c) determine the teacher and teaching variables which promote such growth, (d) measure such variables and relate them to reading growth, and (e) improve the program of teacher education in reading.—*R. Wiltz.*

1367. Campbell, Myra G. (U. Southern California) **Prekindergarten training and its relationship to the first grade reading achievement of educationally disadvantaged children.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4673-4674.

1368. Downing, John. (U. London, Inst. of Education, England) **How children think about reading.** *Reading Teacher*, 1969 (Dec), Vol. 23(3), 217-230.—Attempted to replicate recent research findings which indicate that children's thinking processes differ from adults' in such a way as to produce difficulties for children in understanding the purpose of reading and the abstract technical terms of the language. Preliminary results from interviews with 13 5-yr-old children generally confirm these findings: Ss were found to "have only a vague notion of the purpose of the written language and of what activities are actually involved in reading." It is suggested that these difficulties cannot be overcome by teaching the children the formal rules of the language. Instead, "the essential need of beginning readers... is rich and personally relevant language experiences and activities..." which orientate children to the purposes of reading and writing and generate understanding of technical language concepts. (19 ref.)—*R. Wiltz.*

1369. Dusewicz, Russell A. **Early childhood education for disadvantaged two-year-olds.** *Psychological Reports*, 1970 (Jun), Vol. 26(3), 954.—Exposed 10 disadvantaged Negro 2 yr. olds to an academic preschool enrichment program of programed sequences of environmental interactions after sensory training. Cognitive ability on the Slosson Intelligence Test showed a mean gain in MA of 6.94 mo., representing a growth rate of 3.45 times the normal over an average 1.56-mo period. Results of the Vineland Social Maturity Scale showed a

mean gain of 2.88 mo. for a mean growth rate of 1.85 times the normal. "It is suggested that early childhood and preschool programs might well profit from an emphasis on fundamental abilities and working with children under 3 yr. of age."—*M. Daniels.*

1370. Evans, Charles L. (North Texas State U.) **The immediate effects of classroom integration on the academic progress, self-concept, and racial attitude of Negro elementary children.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4825-4826.

1371. Frager, Stanley & Stern, Carolyn. **Learning by teaching.** *Reading Teacher*, 1970 (Feb), Vol. 23(5), 403-405, 417.—Evaluated 2 procedures for counseling 6th grade tutors of kindergarten children. On the basis of Stanford Achievement Test reading scores, 48 tutors were evenly divided into 2 groups of high and low achievers, with 1/2 in each group given traditional tutor counseling and 1/2 taught an experimental 5-step procedure emphasizing basic learning principles. Kindergarten in need of remedial work were divided into 3 groups receiving traditional counseling, experimental counseling, or no counseling. Pre- and postmeasures on the criterion test provided with the McNeil ABC Learning Activities indicate that Ss receiving tutoring, regardless of method, were significantly superior to untutored Ss. Significant differences were found between experimental and control low-achieving tutors in changes in school morale, attitudes, attendance, and feelings about themselves. Findings "support the recommendation that low-achieving students make effective tutors of younger disadvantaged children, and at the same time, profit considerably themselves."—*R. Wiltz.*

1372. Hansen, Halvor P. (U. of the Pacific) **Language pedagogy for teachers of deprived children.** *Acta Symbolica*, 1970 (Spr), Vol. 1(1), 3-11.—Oral language experience is considered very important. Transformational grammar is briefly described. The child's own language competence should be used as a base for further language instruction. (15 ref.)—*M. Cynamon.*

1373. Karnes, Merle B., Teska, James A., & Hodgins, Audrey S. (U. Illinois, Coll. of Education, Champaign) **The effects of four programs of classroom intervention on the intellectual and language development of 4-year-old disadvantaged children.** *American Journal of Orthopsychiatry*, 1970 (Jan), Vol. 40(1), 58-76.—Evaluated the differential effects of 4 preschool intervention programs (a traditional nursery school program vs. a community-integrated program vs. the Montessori program vs. an experimental program) through pre- and postbatteries of standardized tests. The interventions represented levels of structure along a continuum from the traditional to the highly structured preschool. Evaluation procedures consisted of: (a) intellectual functioning as measured by the 1960 Stanford-Binet Individual Intelligence Scale, Form L-M; (b) language development as measured by the Illinois Test of Psycholinguistics Ability, experimental edition, 1961; and (c) vocabulary comprehension as measured by the PPVT. The Frostig Developmental Test of Visual Perception was administered at the time of the post-battery. Results from all instruments differentiated among the programs, and clearly favored the highly structured preschool.—*Journal abstract.*

1374. Moehle, John H. (Superintendent of Schools, Carle Place, Long Island, N.Y.) **How one school system plans to handle sex education.** *Child &*

Family, 1968 (Fall), Vol. 7(4), 342-347.—Presents a sex education program which is integrated into the regular curriculum and taught by regular teachers. Kindergarten through 3rd grade children are excluded from the program. It is concluded that sex education is most useful when "it falls into a natural teaching area."—G. Steele.

1375. Rosen, Carl L. & Ortego, Philip D. (U. Texas, El Paso) **Language and reading problems of Spanish speaking children in the Southwest.** *Journal of Reading Behavior*, 1969 (Win), Vol. 1(1), 51-70.—Examines 5 major categories of language problems of Spanish speaking children: (a) the vague definition of bilingualism, (b) inadequate timing of 2nd language instruction, (c) improper learning context for 2nd language instruction, (d) the issue of language equivalence on a bilingual scale, and (e) dealing with individual differences attributable to individual child status. The difficulties involved in a number of current approaches used to teach reading to Spanish speaking children are discussed, and the necessity for developing new and more appropriate techniques, i.e., linguistically oriented reading materials, a language experience approach, and a bilingual approach based upon the unique needs of the Spanish speaking child is emphasized. It is concluded that while no approach should be considered a panacea, a number of techniques appear promising. (70 ref.)—R. Wiltz.

1376. Sie, Maureen S. (Iowa State U.) **Pupil achievement in an experimental nongraded elementary school.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4783-4784.

1377. Suppes, Patrick & Ihrke, Constance. **Accelerated program in elementary-school mathematics: The fourth year.** *Psychology in the Schools*, 1970 (Apr), Vol. 7(2), 111-126.—Describes the 4th yr. of a longitudinal study of the accelerated program in elementary school mathematics conducted at Stanford University. As in previous studies, the report contains curriculum descriptions, group composition, class procedures, and behavioral data. In general, the results indicate that pupils in the accelerated program tend to be well above grade level on most measures in the study.—H. Kaczowski.

Teaching Methods & Teaching Aids

1378. Alderfer, Clayton P. (Yale U.) **Teaching organizational change to "insiders" and "outsiders."** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 397-401.—Reports an attempt in a teaching situation to combine intellectual content and interpersonal process within a single course. Ss were approximately 20 advanced graduate students, of whom about 1/2 were members of the administrative sciences department ("insiders"), and the others, members of other graduate departments ("outsiders"). As the course progressed, (a) a split developed between the 2 groups which illustrates (a) pertinent issues of competitiveness and other aspects of group dynamics, (b) the relative distribution of time for content and process teaching, and (c) the role of the instructor.—P. McMillan.

1379. Arney, V. I. (Linn County Board of Education, Cedar Rapids, Ia.) **"Personalized" productions of 8mm films improve student motivation and involvement.** *Journal of Learning Disabilities*, 1968 (Sep), Vol. 1(9), 519-522.—Discusses some of the mechanics in-

involved in, and projects which resulted from a school program in which students either helped produce films or were filmed while participating in various activities. It is demonstrated that the use of motion picture films in education motivates students to learn, personalizes studies, and creates mutual involvement in teacher-student planning.—M. Maney.

1380. Biryukov, B. V. & Landa, L. N. (Inst. of Psychology, Moscow, USSR) **Metodologicheskiy analiz ponyatiya algoritma v psikhologii i pedagogike v svyazi s zadachami obucheniya.** [Methodological analysis of the concept of algorithm in psychology and pedagogy in connection with the goals of instruction.] *Voprosy Algoritmizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 17-38.—Presents 21 separate commentaries in depth on the algorithmic approach in psychology and pedagogy, and the methodological conclusions derived.—I. D. London.

1381. Bozhovich, E. D. & Granik, G. G. (Inst. of Psychology, Moscow, USSR) **Programirovanie nekotorykh razdelov sintaksisa russkogo yazyka v svyazi s zadachei razvitiya kul'tury rechi uchashchikhsya.** [Programming of several sections of Russian syntax in connection with the aim of raising the level of speech in pupils.] *Voprosy Algoritmizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 64-69.—Presents an analysis of the initial stages of programmed instruction for the development in pupils of methods for the construction and use in speech of grammatically correct sentences, involving "verbal adverbs." Experimental results are encouraging.—I. D. London.

1382. Feldhusen, Hazel J., Lamb, Pose, & Feldhusen, John. (Cumberland School, West Lafayette, Ind.) **Prediction of reading achievement under programmed and traditional instruction.** *Reading Teacher*, 1970 (Feb), Vol. 23(5), 446-454.—60 female and 58 male 1st graders were evenly divided into an experimental group in which programmed instruction supplemented the basic reading program, and a control group in which the basic program was not supplemented. Sex, IQ, and 16 background characteristics were also examined for possible relations to the dependent variable of achievement on 3 subtests (Word Knowledge, Word Discrimination, and Reading Comprehension) of the Metropolitan Achievement Test, Form A. Results indicate that the experimental group scored significantly higher than controls and that high IQ Ss scored significantly higher than low IQ Ss. No significant main effect was found for sex, and there were no significant interactions. The following background characteristics were significantly related to achievement scores: IQ, father's occupation, parents' education, word-meaning readiness, matching readiness, and a total readiness score. Limitations of the study in terms of possible E bias, uncontrolled instruction time, and a nonrandom sample are noted.—R. Wiltz.

1383. Granik, G. G. (Inst. of Psychology, Moscow, USSR) **O dvukh sposobakh obucheniya priëmam umstvennoy raboty pri programirovani kursa russkogo yazyka.** [On two ways of teaching methods of mental application in a programmed course of the Russian language.] *Voprosy Algoritmizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 95-105.—Presents materials from a study, in which 20 6th graders were Ss, to determine ways of forming the most effective "systems of mental operations" in a programmed course dealing with Russian grammar.—I. D. London.

1384. Grunwald, Bernice. (Alfred Adler Inst., Chicago, Ill.) **Role playing as a classroom group procedure.** *Individual Psychologist*, 1969 (Nov), Vol. 6(2), 34-38.—Offers suggestions and illustrative examples of the use of role-playing in the classroom.—A. R. Howard.

D. London.

1388. Shenshev, L. V. (Inst. of Psychology, Moscow, USSR) **Adaptivnye vozmozhnosti obuchayushchikh ustroystv s vnutrennim programmirovaniem.** [Adaptive potentialities of teaching devices with internal programing.] *Voprosy Algoritimizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 168-196.—Presents an analysis from the viewpoint of game theory.—I. D. London.

1389. Shenshev, L. V. (Inst. of Psychology, Moscow, USSR) **Nekotorye printsipy konstruirovaniya lingafonnykh uzlov dlya programmirovannogo obucheniya.** [Some principles for the construction of language laboratories for programed instruction.] *Voprosy Algoritimizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 197-209.—Discusses the construction and operation of different types of "linguaphonic centers [language laboratories]" for the programed learning of foreign languages.—I. D. London.

1390. Shenshev, L. V. (Inst. of Psychology, Moscow, USSR) **Ob optimal'nom raspredelenii funktsii mezhdu chelovekom i obuchayushchimi ego ustroystvom.** [On the optimal distribution of functions between man and his teaching machine.] *Voprosy Algoritimizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 154-167.—Discusses the problem, its history, and possible future resolutions, including "hybridization" of the educational film and teaching machines.—I. D. London.

1391. Vaizer, G. A. (Inst. of Psychology, Moscow, USSR) **Ob algoritmicheskom podkhode v obuchenii fizike.** [On the algorithmic approach to physics instruction.] *Voprosy Algoritimizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 143-153.—The application of algorithms is shown to be an important means of raising the effectiveness of physics instruction.—I. D. London.

1392. Yudina, O. N. & Granik, G. G. (Inst. of Psychology, Moscow, USSR) **O nekotorykh sposobakh dinamicheskoi adaptatsii obucheniya na osnove diagnostiki prichin oshibok.** [On some methods of dynamic adaptation of instruction on the basis of diagnosis of the reasons for errors.] *Voprosy Algoritimizatsii i Programirovaniya Obucheniya*, 1969, No. 1, 53-63.—It is shown that the "goal of dynamic adaptation [individualization] of instruction, based on diagnosis of the reasons for errors, can be accomplished even without teaching machines by means of a programed textbook."—I. D. London.

PERSONNEL & INDUSTRIAL PSYCHOLOGY

1393. Heneman, Herbert G. (U. Minnesota) **Contributions of industrial relations research.** *Manpower & Applied Psychology*, 1968 (Win), Vol. 2(2), 5-16.—Presents a brief overview of research accomplishments, contributions, and needs of industrial relations research in the United States.—P. L. Crawford.

1394. Moses, Joseph L. (Pace Coll.) **Utilization of the behavioral scientist in industry.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 367-370.—Contends that behavioral scientists are underutilized in industrial organizations. Possible roles suggested for the behavioral scientist in an "ideal" organization include resource person, consultant, trainer, disseminator of behavioral science knowledge, and professional liaison.—P. McMillan.

1395. Platonov, K. K. (Ed.) **Lichnost' i trud.** [Personality and work.] Moscow, USSR: Mysl', 1965. 366 p.—Presents a collection of 15 articles in the form of chapters, submitted by over 15 contributors, primarily on "personality formation in the work process from the position of the psychological theory of personality." Problems, connected with small groups and interpersonal relations in the work context, are also considered.—I. D. London.

VOCATIONAL CHOICE & GUIDANCE

1396. Lee, Sang M. (Virginia Polytechnic Inst.) **Job selection by college graduates.** *Personnel Journal*, 1970 (May), Vol. 49(5), 392-395.—A survey in 1 college revealed that appealing job, potential for advancement, and the kind of people met in the organization are factors of prime importance considered by college graduates (N = 514) in selecting the starting position.—P. L. Crawford.

1397. Mirande, Alfred M. (U. Kentucky) **On occupational aspirations and job attainments.** *Rural Sociology*, 1968 (Sep), Vol. 33(3), 349-353.—Questions results from W. P. Kuvlesky and C. B. Bealer's (see PA, Vol. 41:16530) investigation which found a weak relationship between adolescent aspirations and occupational attainment. It is argued that: (a) findings were conditioned by the measure of congruence employed, (b) measures of attainment and/or aspiration were restrictive and arbitrary, and (c) bias away from high prediction was built in by selecting a rural sample.—M. Maney.

SELECTION & PLACEMENT

TRAINING

1398. Bealer, Robert C. & Kuvlesky, William P. (Pennsylvania State U. On occupational aspirations and job attainments: A reply.) *Rural Sociology*, 1968 (Sep), Vol. 33(3), 353-356.—Responds to specific criticisms by A. M. Mirande (see PA, Vol. 45:Issue 1) of C. B. Bealer and W. P. Kuvlesky's (see PA, Vol. 41:16530) investigation of adolescent aspirations and occupational attainment, concluding that "no compelling grounds" for adjustment of stated conclusions are presented. It is contended that no pretense was made that the conclusions drawn were definitive but that they were an attempt to provide directions for future research and as such are open to possible qualifications as facts warrant.—M. Maney.

1399. Meyer, John M. (U. California, Los Angeles) **Effect of demonstrator and observer positions upon learning a perceptual motor skill.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 4878.

1400. O'Connor, Robert D. & Rappaport, Julian. (U. Illinois) **Application of social learning principles to the training of ghetto blacks.** *American Psychologist*, 1970 (Jul), Vol. 25(7), 659-661.—Describes an employment training program applying the principles of reinforcement, modeling, role playing and programmed learning. The program was instituted by psychologists working with a local affiliate of The Opportunities Industrialization Center, an organization administered by blacks and focusing on unemployed ghetto residents. 6 men representing the hard core unemployed, were trained for jobs as child care aides to fill positions at a local state-operated mental health center. All 5 who completed the 12 1-hr sessions passed civil service examination, and 4 were hired. Procedures for avoiding delay of gratification problems and recruiting difficulties are discussed in light of current social learning theory.—Author abstract.

TASK & WORK ANALYSIS

1401. Bitter, James A. (U. Missouri) **Bias effect on validity and reliability of a rating scale.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(2), 70-75.—Attempted to determine the effect of rater bias on the predictive validity and rater reliability of the Work Adjustment Rating Form (WARF). The results suggest that (a) the WARF is subject to rater bias that can significantly affect the scale's predictive validity for individual raters, (b) rater bias did not affect the mean predictive validity and the mean reliability estimate of the WARF, and (c) rater bias can be minimized by using more than 1 rater.—S. M. Amatora.

1402. Jeanneret, Paul R. (Purdue U.) **A study of the job dimensions of "worker-oriented" job variables and of their attribute profiles.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5273-5274.

1403. Susman, Gerald I. (Pennsylvania State U.) **The concept of status congruence as a basis to predict task allocations in autonomous work groups.** *Administrative Science Quarterly*, 1970 (Jun), Vol. 15(2), 164-175.—This field study investigated work groups in an oil refinery whose members were allowed to make their own decisions about task allocation. The concept of status congruence was utilized to predict that tasks

would be assigned on the basis of the consistency between valued task and valued member attributes. The data supported the hypothesis for 1 job classification, but were consistently in the opposite direction of predictions for another. Supplementary field data indicated that the value of job and task attributes varied with rank of formal job classification. Implications of the findings for increased understanding of autonomous group functioning are discussed. (25 ref.)—Journal abstract.

PERFORMANCE & JOB SATISFACTION

MANAGEMENT & ORGANIZATION

1404. Burke, W. Warner. (National Training Lab. Inst., Center for Organizational Studies, Washington, D.C.) **Training organization development specialists.** *Professional Psychology*, 1970 (Sum), Vol. 1(4), 354-358.—Describes a residential training program for organization development specialists, which uses principles of experience-based learning. This program was designed and conducted by National Training Laboratory Institute members for 4 wk. each summer since 1967. Participants are internal change agents from a variety of organizations, the largest group being from business and industry. The program covers theories and strategies of change, organization, diagnosis, consultation, team building, intergroup confrontation, and other related areas.—Journal abstract.

1405. England, George W. & Kolke, Ryohji. (U. Minnesota, Industrial Relations Center) **Personal value systems of Japanese managers.** *Journal of Cross-Cultural Psychology*, 1970 (Spr), Vol. 1(1), 21-40.—As a total group, 394 Japanese managers were found to have pragmatic primary value orientations and to be morally and ethically oriented. Possible relationships between their values and their organizational behavior are suggested.—A. Krichev.

1406. Gordon, Leonard V. **Correlates of bureaucratic orientation.** *Manpower & Applied Psychology*, 1968 (Win), Vol. 2(2), 54-59.—Studied the postulation of a personality construct based on a particular organizational model (bureaucratic), the development of a measure of this construct, and its preliminary validation. It is concluded that a reliable measure of individual differences has been derived from the bureaucratic organizational model, and construct validity information so far available is highly positive.—P. L. Crawford.

1407. Rizzo, John R., House, Robert J., & Lirtzman, Sidney I. (Western Michigan U.) **Role conflict and ambiguity in complex organizations.** *Administrative Science Quarterly*, 1970 (Jun), Vol. 15(2), 150-163.—Describes the development and testing of questionnaire measures of role conflict and ambiguity. Analyses of responses of managers show these 2 constructs to be factorially identifiable and independent. Ss were a 35% random sample of the central offices and main plant of the firm and a 100% sample of the research and engineering division. Derived measures of role conflict and ambiguity tended to correlate in the 2 samples in expected directions with measures of organizational and managerial practices and leader behavior, and with member satisfaction, anxiety, and propensity to leave the organization. (33 ref.)—Journal abstract.

1408. Smith, Clagett G. (U. Notre Dame) **Consul-**

tation and decision processes in a research and development laboratory. *Administrative Science Quarterly*, 1970 (Jun), Vol. 15(2), 203-215.—The study of the relationship between consultation and decision processes in an industrial research laboratory showed the efficacy of multidirectional consultation coupled with a pattern of shared, decentralized decision making. The loose, decentralized pattern was closely associated with more science-oriented activity, while the hierarchical pattern with more practical or organizationally relevant activities. The relationships obtained between this loose or hierarchical pattern and performance were mediated by coordination, adequacy of work expectations, and level of member involvement. The results also suggest that when decision centers are consistent with consultation centers, implying a congruence between authority and expertise, the overall structure of the laboratory is less important. (18 ref.)—*Journal abstract*.

1409. Snyder, Sherwin L. (Indiana U.) **Organization choice: A study of accountants in public and private employment.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-B), 5275-5276.

1410. Turrill, Robert B. (U. California, Los Angeles) **Use of the semantic differential in relating perceived self-organizational environment similarity to the meaning of membership in a bureaucracy.** *Dissertation Abstracts International*, 1970 (May), Vol. 30(11-A), 5070-5071.

SPECIAL ENVIRONMENTS

ADVERTISING & CONSUMER PSYCHOLOGY

1411. Granbois, Donald H. (Indiana U.) **Improving the study of customer in-store behavior.** *Journal of Marketing*, 1968 (Oct), Vol. 32(4, Pt. 1), 28-33.—Improved retail decisions can result from attempts to measure customer response to price, display, store layout, and other controllable variables. It is shown how the combination of entrance interviews and direct observation can provide management with more meaningful information from the study of customer in-store behavior.—*Journal abstract*.

1412. Kunkel, John H. & Berry, Leonard L. (Arizona State U.) **A behavioral conception of retail image.** *Journal of Marketing*, 1968 (Oct), Vol. 32(4, Pt. 1), 21-27.—Describes the problems involved in defining retail store image. The result of these problems has been an avoidance of definition or definitions based on a variety of assumptions about the internal psychological state. An alternative approach to the image concept is presented in which the usual assumptions about the internal state are avoided and a behavioral model of man in combination with procedures based on unstructured instruments is used. The procedures involved in the acquisition and maintenance of retail images are outlined, and implications for practitioners and academicians are indicated.—*Journal abstract*.

1413. Myers, James H. & Alpert, Mark I. (U. Southern California) **Determinant buying attitudes: Meaning and measurement.** *Journal of Marketing*, 1968 (Oct), Vol. 32(4, Pt. 1), 13-20.—Argues that out of many possible attitudes toward purchasing decisions only a few relate to or determine buying behavior. These attitudes are defined, their meaning and relevance to

marketing strategy are described, and methods of measuring them are discussed.—*Journal abstract*.

ENGINEERING PSYCHOLOGY

1414. Dmitrieva, M. A. **Konferentsiya po inzhenernoi psikhologii v LGU.** [A conference on engineering psychology at LSU.] *Voprosy Psikhologii*, 1970 (May), Vol. 16(3), 186-187.—Presents the proceedings of a 1969 conference held at Leningrad State University.—*L. Zusne*.

Displays & Controls

DRIVING & SAFETY

1415. Duckstein, Lucien; Unwin, Ernest A., & Boyd, Eugene T. (U. Arizona) **Variable perception time in car following and its effect on model stability.** *IEEE Transactions on Man-Machine Systems*, 1970 (Sep), Vol. MMS-11(3), 149-156.—Studied the functional variation of perception time (T) in car following to introduce a variable time delay into a previously proposed nonlinear model. It is hypothesized that the ratio of a just noticeable difference in visual angle ($\Delta\theta$) to the visual angle (θ) is a constant. This hypothesis leads to a model in which T is proportional to relative spacing and inversely proportional to relative speed. Results agree with the model for negative relative speeds 3-18 ft/sec. A 2nd-order approximation is used to explain behavior for relative speeds of less than 3 ft/sec in absolute value. This 2nd-order approximation also agrees well with data taken previously with relative acceleration (1-4.7 ft/sec²) and initial relative speed (1.9-2.9 ft/sec). A brief discussion of ideal following distance clarifies the stability analysis. The introduction of a variable time delay and ideal following distance into the proposed car-following model changes the size of the minimum asymptotic stability region but not the basic properties of the model. The word asymptotic is used in the dynamic stability sense as in the classical control theory literature.—*Journal abstract*.

1416. Hartman, Bryce O. & Cantrell, George K. **Psychologic factors in "landing-short" accidents.** *Flight Safety*, 1968 (Jun), Vol. 2(1), 26-32.—Reviews human factors and biomedical studies pertinent to prediction of accidents during approach and landing and describes the kind of study which would yield a multivariable prediction of the probability of a landing-short accident under the most common conditions. (18 ref.)—*Journal abstract*.

1417. Stanojlovic, Bosco R. **Man and safety in aviation.** *Flight Safety*, 1969 (Feb), Vol. 2(3), 3-10.—Reviews present standards of aviation safety and discusses the causes of accidents, learning curve, safety expectations, crashworthiness, emergency evacuation, fire, midair collision, and training. It is stressed that man in aviation is the focal point of air safety and the factor responsible for all successes and failures. The importance of pride in work, personal dignity, and high ethical and moral standards as basic requirements for high safety standards is discussed. The need for more research of human factors, especially variations in aircrew discipline and efficiency caused by environment and social factors, is emphasized.—*G. Steele*.

Brief Subject Index

This index supplements the classification of abstracts given in the Table of Contents, and is designed to lead the reader to subjects that are more specific than the general categories of the classification. When many abstract numbers are listed under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

Ability (see also Childhood/Ability in)
597, 909, 1260

Ability/Verbal (SEE Ability, Verbal Behavior)
Abnormal Behavior (SEE Behavior Disorder, Mental Disorder, Neurosis, Psychosis, specific abnormalities)

Abnormal Psychology (SEE Clinical Psychology, Psychopathology)

Abortion
601, 602, 603, 726

Absolute Judgment (SEE Judgment/Perceptual)

Abstraction (SEE Concept, Generalization, Thinking)

Academic Achievement (SEE Achievement/Academic, Achievement/Academic-College, Achievement/Academic-Elementary School)

Bone Conduction (SEE Audition)
Books
 11, 13, 15, 18, 33, 56, 66, 76, 103, 139, 194, 215, 227, 229, 232, 376, 382, 460, 467, 472, 474, 484, 539, 546, 552, 553, 554, 561, 582, 593, 619, 660, 665, 796, 938, 1001, 1058, 1106, 1122, 1135, 1165, 1167, 1171, 1180, 1243, 1236, 1292, 1395
Boredom (SEE Attitude, Emotion)
Brain (see also next headings, Cerebral Cortex, Hypothalamus, Hippocampus, Nervous System/Central, Neuroanatomy, Thalamus)
 76, 233, 294, 340, 896
Brain-Animal
 217, 234, 235, 278, 287, 330, 332, 353, 354, 370, 372, 376, 380
Brain Damage
 859, 934, 938, 955, 1070, 1088, 1093, 1138, 1151, 1163, 1168, 1173, 1174, 1175, 1176, 1177, 1178, 1183, 1292, 1294
Brain Disorder
 720, 721, 1046, 1080, 1094, 1144, 1150, 1151, 1162, 1168, 1172
Brain Injury (SEE Brain Damage)
Brain Lesion (see also Brain Lesion-Animal, 313, 1144)
Brain Lesion-Animal (see also Rat/Lesions in, Cat/Lesions in)
 244, 245, 247, 256, 265
Brain Stimulation (see also Rat/Brain Stimulation in)
 267, 269, 276, 278, 283, 310
Breeding (SEE Genetics)
Brightness (see also Light)
 88, 89, 91, 95, 107, 257, 259, 321
Britain (SEE Great Britain)
Broken Home (SEE Family, Marital Problems)
Business
 1316, 1404
California Psychological Inventory (SEE Test/Personality)
Canada
 587, 666
Cancer (SEE Disease)
Capital Punishment (SEE Law, Crime & Criminals)
Cardiovascular Disorders
 376, 720, 859, 1146, 1151, 1172, 1240, 1245
Cardiovascular Processes (see also Blood, Blood-Animal, Blood Pressure, Heart, Heart Rate)
 216, 217, 233, 374, 375, 376, 377, 791, 1141, 1150
Career (SEE Occupation)
Career Choice (SEE Occupational Choice)
Case Report
 533, 783, 906, 1064, 1070, 1071, 1073, 1074, 1077, 1079, 1080, 1081, 1083, 1087, 1088, 1089, 1090, 1091, 1094, 1096, 1097, 1098, 1099, 1245
Case Report-Treatment
 742, 838, 863, 1003, 1031, 1040, 1072, 1075, 1076, 1078, 1082, 1084, 1085, 1086, 1092, 1093, 1095
Casework (SEE Social Casework)
Castration (SEE Personality, Sex, Sexual Behavior)

BRIEF SUBJECT INDEX

- Cat**
239, 267, 274, 278, 283, 285, 297, 298, 299,
305, 310, 312, 377
- Cat/Drug Effects in**
370, 371
- Cat/Learning in**
263
- Cat/Lesions in**
241, 249, 250, 254, 262, 263, 310
- Catalepsy** (SEE Mental Disorder, Neurosis,
Psychosis)
- Categorical Behavior**
164, 191, 197, 203, 213, 511, 518
- Catharsis** (SEE Therapeutic Process)
- Cathexis** (SEE Affect, Psychoanalytic Theory)
- Catholicism** (SEE Religion)
- Census Studies** (SEE Population Character-
istics)
- Central Nervous System** (SEE Nervous Sys-
tem/Central)
- Cerebral Cortex** (see also Visual Cortex)
226, 247, 267, 285, 288, 293, 307, 322, 376,
380, 1180, 1182
- Cerebral Dominance** (SEE Cerebral Cortex,
Laterality)
- Cerebral Palsy** (SEE Physical Handicap, Nerv-
ous System/Disorder of)
- Cerebral Thrombosis** (SEE Brain Disorder,
Cardiovascular Disorders)
- Cerebrovascular Disorder** (SEE Brain Disor-
der, Cardiovascular Disorders)
- Certainty** (see also Probability)
157, 503
- Character** (SEE Personality, Ethics)
- Character Disorder** (see also Emotional Dis-
turbance)
920, 941, 965, 984, 1019, 1168
- Cheating** (SEE Deception)
- Check List** (SEE Inventory)
- Chicken**
435
- Child Abuse**
- Child Guidance** (SEE Psychotherapy/Child-
ren, Guidance/Educational)
- Child Psychiatry** (see also Psychotherapy/
Children, Schizophrenia/Childhood, Child-
hood/Psychosis in)
532, 798, 815, 834, 881, 906, 922, 959, 1003,
1005, 1031, 1072, 1074, 1087
- Child Rearing** (see also Parent-Child Rela-
tions)
465, 536, 596, 1036
- Childhood & Children** (see also next headings,
Gifted, Student/Elementary School, Lan-
guage Development, Mental Retardation)
290, 459, 476, 481, 486, 488, 517, 535, 544,
777, 916, 1010, 1012, 1247
- Childhood/Ability in**
502, 503, 510, 513, 514, 515, 518, 519, 522,
523, 526, 527, 1133, 1271, 1286, 1304, 1310,
1353, 1373
- Childhood/Behavior Problems in**
724, 856, 922, 954, 957, 969, 994, 1190,
1192, 1290
- Childhood/Concepts & Problem Solving in**
472, 483, 484, 494, 495, 497, 499, 500, 501,
502, 504, 505, 506, 508, 509, 520, 531, 1099,
1169, 1299, 1368
- Childhood/Development in** (see also Age Dif-
ferences-Children)
57, 462, 464, 467, 472, 474, 475, 478, 479,
482, 485, 486, 487, 489, 491, 492, 500, 502,
504, 506, 512, 516, 520, 521, 522, 524, 528,
735, 926, 1169, 1193, 1273, 1310, 1312,
1373
- Childhood/Disadvantaged** (see also Socioeco-
nomic Status)
512, 516, 518, 545, 572, 576, 1271, 1283,
1295, 1296, 1347, 1367, 1369, 1371, 1372,
1373
- Childhood/Emotional Disturbances in**
723, 770, 851, 890, 982, 1009, 1086, 1095,
1312
- Childhood/Family Relations in** (SEE Parent-
Child Relations, Family Relations)
- Childhood/Gifted** (SEE Gifted)
- Childhood/Handicapped**
1072, 1119, 1138, 1169, 1239, 1291, 1297,
1302
- Childhood/Hyperactivity in** (SEE Childhood/
Behavior Problems in)
- Childhood/Learning in** (see also Achieve-
ment/Academic-Elementary School, Student/
Elementary School, School Learning)
461, 476, 477, 484, 485, 489, 490, 491, 492,
493, 494, 495, 496, 497, 498, 501, 512, 1228,
1368, 1375
- Childhood/Mental Retardation in** (SEE Mental
Retardation)
- Childhood/Perception in**
459, 468, 474, 477, 483, 484, 496, 505, 509,
523, 524, 525, 526, 527, 1130, 1304
- Childhood/Personality in**
462, 463, 481, 521, 528, 529, 530, 531, 532,
542, 543, 559, 736, 1026, 1087, 1099, 1239,
1271, 1336
- Childhood/Physical Illness in**
779, 957, 1235
- Childhood/Play in** (SEE Childhood/Social
Behavior in)
- Childhood/Preschool**
463, 473, 478, 479, 480, 491, 497, 506, 509,
512, 515, 519, 521, 527, 529, 533, 540, 541,
1130, 1135, 1267, 1269, 1270, 1354, 1367,
1369, 1371, 1373
- Childhood/Psychosis in**
861
- Childhood/Psychotherapy** (SEE Psychothera-
py/Children)
- Childhood/Retarded** (SEE Mental Retarda-
tion)
- Childhood/Schizophrenia in** (SEE Schizophre-
nia/Childhood)
- Childhood/Social Behavior in**
481, 484, 533, 534, 536, 537, 538, 1193,
1214, 1306
- Chlordiazepoxide** (SEE Tranquilizer)
- Chlorpromazine**
361, 370, 371, 866, 873, 877
- Choice Behavior** (see also Decision Making,
Learning/Probability)
23, 142, 143, 211, 214, 254, 411, 501, 613,
620, 910, 1193, 1257, 1388
- Chromosome** (SEE Genetics)
- City** (SEE Urban & Suburban Environment)
- Civil Rights** (SEE Social Movements, Inte-
gration, Law)
- Class** (SEE Social Structure, Socioeconomic
Status)
- Classical Conditioning** (SEE Conditioning/
Classical)
- Classification** (see also Selection, Categorical
Behavior)
64, 77, 208, 213, 345, 502, 518, 673, 731,
918, 919, 921, 923, 924, 925, 928, 930, 932,
933, 935, 939, 940, 943, 944, 947, 949, 951,
958, 964, 967, 968, 970, 1179, 1310
- Classroom** (see also Education, School, Teach-
ing)
1261, 1277, 1343, 1370, 1384
- Cleft Lip & Palate** (SEE Speech/Defective)
- Clergy** (SEE Religion)
- Client-Centered Therapy** (SEE Psychothera-
py/Methods in)
- Climate** (SEE Environment, Temperature)
- Clinic** (see also Community Services, Hospital,
Treatment/Outpatient)
860, 882, 1125, 1246, 1247
- Clinical Judgment** (see also Psychodiagnosis)
732, 792, 839, 876, 923, 936, 953, 960, 962,
969, 1023, 1029, 1253
- Clinical Psychology**
45, 57, 726, 741, 935
- Cluster Analysis** (SEE Factor Analysis, Sta-
tistics)
- Coalition Formation** (SEE Group/Small)
- Cochlea** (SEE Ear)
- Coding** (SEE Categorical Behavior, Problem
Solving, Display)
- Cognition** (see also Thinking, Categorical
Behavior)
205, 502, 516, 531, 584, 702, 814, 831, 912,
936, 1119, 1285, 1361
- Cognitive Dissonance** (SEE Attitude Change,
Dissonance)
- Cognitive Style**
499, 511, 724, 1259
- Coitus** (SEE Sexual Behavior, Sexual Behav-
ior-Animal)
- Cold** (SEE Temperature)
- College** (see also Education, School, Student/
College)
1261, 1265, 1274, 1275, 1320, 1324, 1329,
1334, 1340
- College Counseling** (SEE Counseling, Guide-
ance/Educational, Guidance/Vocational)
- College Student** (SEE Student/College)
- College Success** (SEE Achievement/Academ-
ic College)
- Color** (see also Color Vision)
161, 164, 403, 1065
- Color Vision**
107, 108, 109, 110, 111, 112, 171, 317, 320,
326, 1127, 1130, 1132
- Communication** (see also Communication/
Nonverbal, Information, Language, Speech,
Verbal Behavior)
43, 545, 563, 597, 606, 614, 643, 797, 816,
848, 937, 980, 1057, 1186, 1286
- Communication/Animal** (SEE Communica-
tion, Vocalization)
- Communication/Mass** (see also Television,
Advertising)
149, 596, 649, 808, 983
- Communication/Nonverbal**
545, 797, 816, 840, 1075
- Community** (see also Culture, Group)
382, 517, 595, 605, 666, 734, 743, 796, 888,
894, 1002, 1187, 1232, 1249
- Community Services** (see also Clinic, Mental
Health)
561, 744, 822, 884, 889, 973, 1111, 1184,
1204, 1247, 1248, 1249, 1250, 1254
- Comparative Psychology** (see also Animal
Psychology)
390, 391, 392, 393, 394
- Competition** (see also Conflict, Cooperation,
Motivation)
538, 632, 634, 1103, 1193
- Complexity** (see also Cognitive Style, Stim-
ulus)
311, 659, 1141
- Comprehension** (see also Thinking, Reading)
507, 514, 659, 664, 1347, 1359, 1368
- Compulsion** (SEE Obsession-Compulsion)
- Computer**
75, 76, 77, 78, 206, 212, 306, 739, 1258,
1272
- Concentration Camp** (SEE Prison, War)
- Concept** (see also Childhood/Concepts &
Problem Solving in, Concept Formation,
Thinking)
59, 172, 787, 1216
- Concept Formation** (see also Childhood/Con-
cepts & Problem Solving in)
155, 156, 209, 1226, 1230
- Conditioned Emotional Response**
442, 1136
- Conditioned Galvanic Skin Response** (SEE
Galvanic Skin Response)
- Conditioned Reflex** (SEE Conditioned Re-
sponse, Reflex)
- Conditioned Response**
338, 415, 429, 430, 437, 440, 735
- Conditioning** (see also next headings)
147, 150, 170, 222, 303, 322
- Conditioning/Avoidance** (SEE Learning/
Avoidance, Rat/Avoidance & Avoidance
Learning in)
- Conditioning/Classical**
148, 276, 301, 325, 416, 417, 419, 721
- Conditioning/Escape** (SEE Escape)
- Conditioning/Eyelid**
151, 276, 416, 417, 419
- Conditioning/Interoceptive**
721
- Conditioning/Operant** (see also Rat/Con-
ditioning in)

- 149, 156, 158, 159, 288, 305, 394, 402
Conditioning/Verbal (SEE Learning/Verbal)
Conference (SEE Symposium)
Confidence Judgment (SEE Certainty)
Conflict (see also Frustration, Learning/Avoidance, Interpersonal Processes)
 30, 563, 584, 593, 636, 755, 889, 910, 995, 1097, 1264, 1407
Conformity (see also Authoritarianism, Dominance, Expectation, Interpersonal Influence, Social Influence)
 481, 546, 641, 987
Congress (SEE Symposium)
Connotation (SEE Meaning, Semantics)
Conscience (SEE Value & Values, Ethics, Motivation)
Conscious States (see also Awareness)
Conservation (SEE Childhood/Concepts & Problem Solving in)
Conservatism (SEE Political Behavior, Personality Trait)
Consonance (SEE Dissonance)
Constancy (SEE Gestalt Psychology, Visual Perception, Perception)
Consumer Behavior (see also Advertising)
 1411, 1412, 1413
Contagion (SEE Interpersonal Influence, Social Influence)
Content (SEE Information, Meaning)
Context
 511, 632, 652, 664, 1038, 1375
Contraception (SEE Birth Control)
Contribution & Criticism
 6, 41, 68, 146, 394, 581, 611, 635, 691, 714, 794, 821, 924, 925, 947, 1397, 1398
Control (see also Display)
 540
Control/Internal-External
 638, 679, 1063, 1354
Convulsion (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)
Cooperation
 545, 631
Coordination (SEE Motor Performance)
Coping Behavior (SEE Adjustment/Personal & Social)
Copulatory Behavior (SEE Sexual Behavior-Animal)
Correlation (see also Factor Analysis, Statistics)
 57, 72, 294, 658, 745, 926
Cortex (SEE Cerebral Cortex, Visual Cortex)
Counseling (see also Guidance/Educational, Guidance/Vocational, Interview)
 628, 753, 993, 999, 1105, 1122, 1123, 1125, 1186, 1233, 1247, 1290, 1313, 1317, 1318, 1319, 1320, 1321, 1326, 1327, 1329, 1371
Counseling/College (SEE Guidance/Educational, Guidance/Vocational)
Counselor
 749, 753, 755, 760, 761, 762, 767, 768, 772, 773, 780, 781, 782, 783, 785, 1115, 1123, 1314, 1323, 1325, 1326, 1327, 1329, 1330
Countertransference (SEE Interpersonal Processes, Psychotherapy, Psychoanalysis, Therapeutic Process)
Counting (SEE Mathematics, Number)
Court (SEE Law, Crime & Criminals)
Courtship (SEE Interpersonal Attraction)
Creativity (see also Aesthetics, Gifted, Literature, Music, Thinking)
 521, 530, 704, 717, 972, 1133
Credibility (SEE Experimentation & Experiments, Interpersonal Influence, Social Perception)
Crime & Criminals (see also Delinquency/Juvenile, Law, Prison)
 687, 723, 888, 972, 987, 989, 990, 991, 995, 1102
Crisis & Crisis Intervention (see also Community Services, Emotion)
 837, 865, 978, 985, 1047
Critical Flicker Fusion (SEE Vision)
Criticism (SEE Contribution & Criticism)
Cross-Cultural Differences (see also Culture, Cultures & Countries)
 567, 574, 584, 585, 586, 587, 588, 589, 590, 716
Cue
 169, 176, 179, 337, 391, 425, 506, 604, 1221
Cultural Anthropology (SEE Culture)
Cultural Disadvantage (SEE Socioeconomic Status, Childhood/Disadvantaged)
Culture (see also Cultures & Countries, Ethnology, Social Influence)
 543, 547, 558, 565, 574, 585, 596, 602, 606, 790, 823, 893, 979, 980, 1084, 1295
Cultures & Countries (see also Culture, Africa, Canada, France, Germany, Great Britain, India, Israel, Japan, Latin America, United States, USSR)
 378, 563, 565, 567, 569, 570, 584, 585, 587, 670, 716, 846, 860, 973, 979, 1009, 1010, 1011, 1012, 1013, 1014, 1188, 1248
Curiosity (SEE Motivation, Thinking)
Curriculum (see also School Administration, Mathematics, Reading)
 592, 765, 1251, 1314, 1316, 1363, 1364, 1374, 1376
Cutaneous Sense (see also Skin)
 85, 125, 216, 322, 455, 704
Cybernetics (SEE Communication, Feedback, Computer)

Dark Adaptation (SEE Adaptation/Sensory)
Data Processing (SEE Computer, Statistics)
Day Dreaming (SEE Fantasy)
Deafness & Hearing Disorder
 1077, 1081, 1133, 1134, 1139, 1243, 1298
Death (see also Suicide)
 544, 561, 606, 684, 725, 738, 742, 945, 1010, 1011, 1012, 1013, 1243
Death Penalty (SEE Law)
Deception
 1193, 1266
Decision Making (see also Choice Behavior, Game, Learning/Probability)
 76, 139, 162, 207, 210, 212, 213, 306, 620, 622, 629, 910, 1334, 1408
Decoding (SEE Categorical Behavior, Problem Solving, Display)
Defecation (SEE Elimination)
Defense Mechanism (see also Identification, Repression)
 680, 685, 816, 834, 844, 845, 898, 901, 941, 1095, 1096, 1238
Defense/Perceptual (SEE Defense Mechanism)
Defensiveness (SEE Defense Mechanism, Personality Trait)
Deja Vu (SEE Familiarity, Parapsychology)
Delayed Reaction (SEE Response)
Delinquency/Juvenile (see also Antisocial Behavior, Crime & Criminals)

 792, 797, 839, 845, 855, 865
 Psychotherapy/Short Term
 794, 820, 822, 865
 Puberty (SEE Adolescence)
 Public Opinion (SEE Opinion)
 Pulse (SEE Cardiovascular Processes, Heart Rate)
 Punishment
 441, 443, 444, 447, 493, 537, 540, 988
 Pupil Size (SEE Eye)
 Q-Sort (SEE Test/Personality, Personality Measurement)
 Questionnaire (see also Inventory, Scale, Survey)
 709, 986, 1274, 1402, 1407
 Rabbit
 269, 276, 286, 302, 323, 335, 354, 396, 416, 417, 419
 Race (SEE Ethnicity)
 Race Relations (SEE Integration, Social Movements)
 Racism
 217, 316, 418, 460, 1059, 1241
 Radio (SEE Communication Mass)
 Ranking (SEE Measurement, Scale, Scaling)
 Rapid Eye Movement (see also Dream & Dreaming, Sleep)
 22, 238
 Rat (see also next headings)
 217, 220, 234, 296, 315, 332, 377, 380, 383, 391, 399, 401, 451, 453
 Rat/Activity in
 397, 407
 Rat/Avoidance & Avoidance Learning in
 259, 260, 268, 273, 279, 350, 358, 361, 364, 410, 412, 426, 427, 428, 429, 430, 431, 441, 443, 445
 Rat/Brain Stimulation in
 266, 268, 271, 272, 273, 275, 277, 279, 280, 281, 282, 284
 Rat/Conditioning in
 268, 272, 363, 413, 418, 436, 437, 445
 Rat/Deprivation in
 355, 356, 373, 380, 397, 408
 Rat/Discrimination in
 248, 257, 259, 260, 261, 282, 364, 390, 421, 424, 425, 436, 443
 Rat/Drug Effects in
 240, 330, 350, 351, 356, 358, 359, 361, 362, 363, 364, 365, 366, 367, 368, 369, 408
 Rat/Extinction in
 350, 404, 436, 438, 439, 441, 442, 445, 446, 448
 Rat/Learning in
 243, 248, 257, 259, 268, 390, 404, 412, 413, 426, 428
 Rat/Lesions in
 240, 242, 243, 246, 248, 251, 252, 253, 257, 258, 259, 260, 261, 264, 328
 Rat/Maze Learning in
 260, 328, 365, 411, 424, 434
 Rat/Motivation in
 284, 338, 356, 404, 407, 408, 409, 410, 411
 Rat/Reinforcement & Reinforcement Schedule in
 272, 281, 282, 338, 356, 358, 367, 368, 404, 412, 421, 431, 434, 436, 437, 438, 439, 440, 442, 444, 446
 Rat/Shock & Shock Effects in
 246, 275, 279, 280, 361, 363, 407, 427, 433
 Rat/Stress Effects in
 279, 280, 418
 Rating (see also Rating Scale)
 607, 650, 658, 700, 751, 757, 922, 953, 1266, 1401
 Rating Scale
 Reaction Time
 141, 142, 143, 144, 145, 213, 1224, 1227
 Readability (SEE Display, Writing)
 Reading
 202, 484, 503, 507, 510, 511, 664, 1268, 1293, 1302, 1303, 1304, 1339, 1347, 1366, 1367, 1368, 1382
 Reading Deficiency (see also Education/Special—Remedial)
 507, 511, 1294, 1375
 Reasoning (SEE Logic, Thinking, Cognition, Categorical Behavior)
 Recall (see also Memory, Recognition, Retention)
 132, 152, 157, 165, 166, 169, 173, 174, 175, 176, 178, 182, 185, 186, 188, 189, 190, 192, 193, 198, 199, 498, 676, 702, 1038
 Recognition (see also Memory, Recall, Retention)

- 78, 86, 100, 121, 179, 181, 189, 192, 198, 477, 522, 661, 663, 702, 1293
- Recreation**
1185
- Redundancy** (SEE Information Theory)
- Reflex** (see also Conditioned Response, Response, Muscle)
154, 389, 735, 1199
- Regression** (SEE Personality, Behavior Problems, Statistics)
- Rehabilitation** (see also Counseling, Rehabilitation/Vocational, Education/Special-Remedial)
746, 755, 769, 833, 859, 960, 961, 988, 989, 992, 1102, 1117, 1119, 1162, 1254
- Rehabilitation/Vocational** (see also Mental Retardation/Vocational Rehabilitation & Training in)
1100, 1101, 1103, 1104, 1105, 1107, 1108, 1109, 1110, 1111, 1112, 1113, 1114, 1115, 1116, 1118, 1120
- Reinforcement** (see also next headings, Rat/Reinforcement & Reinforcement Schedule in)
149, 159, 170, 172, 244, 288, 357, 435, 461, 488, 518, 535, 540, 772, 1120, 1122, 1233, 1257, 1298
- Reinforcement Schedule**
171
- Reinforcement Theory**
- Reinforcement/Delayed** (SEE Reinforcement Schedule)
- Reinforcement/Partial** (SEE Reinforcement Schedule)
- Reinforcement/Secondary** (SEE Reinforcement)
- Reinforcement/Social**
158, 172, 488, 513, 515, 1400
- Relaxation** (SEE Behavior Therapy, Muscle)
- Reliability**
177, 488, 703, 708, 710, 923, 953, 1232, 1257, 1307, 1401
- Religion**
13, 557, 568, 579, 580, 581, 582, 583, 592, 599, 602, 684, 768, 979, 1332, 1340
- REM** (SEE Rapid Eye Movement)
- Reminiscence** (SEE Memory, Recall)
- Remission** (SEE Mental Hospital & Hospitalization, Hospital & Hospitalization)
- Repetition** (SEE Stimulation, Familiarity)
- Replication** (SEE Contribution & Criticism)
- Repression**
594, 676, 685
- Reptile** (SEE Animals)
- Research** (see also Experimentation)
68, 588, 921, 925, 947, 958, 1116, 1272, 1366, 1393
- Research Methods**
23, 56, 126, 290, 292, 475, 1196, 1197
- Reserpine** (SEE Tranquilizer)
- Residential Treatment** (SEE Mental Hospital & Hospitalization, Hospital & Hospitalization, Institution & Institutionalization)
- Respiration**
241, 302, 335, 348, 379, 1091, 1141, 1227
- Response** (see also Conditioned Response, Conditioned Emotional Response)
25, 143, 147, 150, 159, 161, 162, 165, 167, 232, 374, 390, 412, 413, 1217, 1222
- Response Latency** (SEE Reaction Time)
- Response Set** (SEE Set)
- Response/Delayed** (SEE Response)
- Retardate** (SEE Mental Retardation)
- Retention** (see also Memory, Recall, Recognition)
181, 187, 188, 193, 197, 200, 357, 417, 428, 1229
- Retina** (see also Eye)
84, 91, 93, 95, 97, 111, 113, 295, 298, 313, 316, 318, 321, 322, 324, 326, 458
- Retirement** (SEE Adulthood, Occupation, Gerontology)
- Retrieval** (SEE Information)
- Reviews**
481, 485, 747, 929, 1145, 1385
- Reward** (see also Reinforcement)
431, 493, 537
- Rigidity** (SEE Personality Trait, Authoritarianism)
- Riot** (SEE Social Behavior/Human, Aggression, Social Movements)
- Risk Taking**
212, 622, 629, 635, 997
- Risky Shift Phenomenon** (SEE Group Dynamics, Risk Taking)
- RNA** (SEE Biochemistry)
- Role**
539, 543, 577, 624, 683, 743, 755, 766, 780, 887, 948, 1002, 1024, 1122, 1193, 1262, 1325, 1329, 1331, 1340, 1384, 1407
- Role Playing** (SEE Role)
- Rorschach Test** (see also Projective Technique)
718, 719, 917, 945, 957
- Rosenzweig Picture Frustration Study** (SEE Projective Technique)
- Rotary Pursuit** (SEE Visual Perception, Motor Performance)
- Rotation** (SEE Somesthesia, Factor Analysis)
- Running** (SEE Activity, Motor Performance)
- Rural Environment** (see also Community, Urban & Suburban Environment)
80, 557, 558, 565, 566, 574, 576, 591, 605, 715, 803, 1009
- Russia** (SEE USSR)
- Sadism** (SEE Sexual Deviation)
- Safety** (see also Driving)
1131, 1416, 1417
- Salary** (SEE Money, Socioeconomic Status)
- Salivation** (SEE Conditioning/Classical, Gland, Taste)
- Salt** (SEE Biochemistry, Food)
- Satiation** (SEE Motivation)
- Scale** (see also Attitude Measurement, Inventory, Rating Scale, Testing Methods)
488, 689, 705, 711, 712, 714, 767, 948, 1253, 1275
- Scaling** (see also Measurement)
61, 509, 610, 648
- Scanning** (SEE Detection)
- Schizophrenia** (see also next headings)
986, 1048, 1050, 1051, 1054, 1056, 1060, 1062, 1063, 1168
- Schizophrenia/Childhood**
956, 1052, 1064, 1075, 1086, 1087, 1292
- Schizophrenia/Chronic**
1046, 1065, 1066, 1068, 1252
- Schizophrenia/Diagnosis of**
1050, 1058
- Schizophrenia/Family Role in**
740, 1049, 1052, 1057, 1058, 1062
- Schizophrenia/Learning & Cognition in**
1015, 1055, 1208
- Schizophrenia/Physiology of**
346, 727, 1061, 1062, 1252
- Schizophrenia/Symptomatology of**
740, 1015, 1048, 1049, 1050, 1053, 1055, 1056, 1059, 1060, 1063
- Schizophrenia/Treatment of** (see also Drug Therapy-Schizophrenia)
740, 1047, 1050, 1057, 1066, 1067, 1068, 1075
- Scholastic Achievement** (SEE Achievement/Academic)
- School** (see also next headings, Achievement, Classroom, College, Education)
1264, 1276, 1295, 1297, 1314, 1321, 1323, 1325, 1331, 1377
- School Achievement** (SEE Achievement/Academic)
- School Adjustment**
1256, 1276, 1278, 1279, 1301
- School Administration**
1326, 1334
- School Anxiety** (SEE Anxiety, Test Anxiety)
- School Dropout**
1278, 1313, 1349
- School Learning** (see also Achievement/Academic)
1293, 1346, 1368, 1371, 1375, 1379, 1382, 1387, 1363, 1391
- School Psychology** (SEE Educational Psychology, Guidance/Educational)
- School Subjects** (SEE Curriculum, Mathematics, Reading)
- Science & Scientists**
11, 44, 795, 897, 939, 1337, 1363, 1364, 1408
- Scientific Method** (SEE Method & Methodology)
- Score & Scoring**
474, 672, 700, 934, 938, 1307
- Seasonal Changes** (SEE Time, Temperature, Environment)
- Security** (SEE Dependency)
- Sedative** (SEE Drugs)
- Segregation** (SEE Integration)
- Seizure** (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)
- Selection**
152, 162, 1107, 1207, 1246, 1396
- Self** (see also next headings)
20, 577, 1280
- Self-Actualization** (SEE Self)
- Self-Concept**
548, 577, 595, 640, 677, 682, 826, 887, 903, 988, 991, 998, 999, 1000, 1186, 1216, 1315, 1341, 1370
- Self-Disclosure** (SEE Interpersonal Processes)
- Self-Esteem** (SEE Self-Concept)
- Self-Evaluation**
610, 617, 637, 641, 685, 691, 709, 710, 751, 766, 1023, 1281, 1339, 1357
- Self-Perception**
463, 611, 624, 644, 645, 709, 710, 736, 762, 817, 839, 906, 975, 1020, 1023, 1030, 1126, 1265, 1306, 1338, 1410
- Self/Ideal** (SEE Self-Concept)
- Self-Stimulation** (SEE Motivation, Stimulation, Brain Stimulation, Rat/Brain Stimulation in)
- Selling** (SEE Advertising, Business, Consumer Behavior)
- Semantic Differential**
155, 201, 568, 608, 609, 687, 1410
- Semantics** (see also Meaning, Meaningfulness)
154, 173, 179, 180, 203, 205, 498, 656, 990, 1140
- Senility** (SEE Geriatrics)
- Sensitivity**
239, 458, 459, 593, 621, 640, 642, 676, 685, 846, 1087
- Sensory Adaptation** (SEE Adaptation/Sensory)
- Sensory Deprivation** (SEE Deprivation/Sensory)
- Sensory Physiology** (SEE Physiology/Sensory)
- Sensory Processes** (see also Intersensory Processes, Physiology/Sensory)
20, 25, 115, 435, 478, 864, 962, 1140
- Sentence**
157, 158, 173, 174, 498, 653, 659, 661, 664, 1298, 1381
- Sentence Completion Test** (SEE Projective Technique)
- Serial Learning** (SEE Learning/Serial)
- Set** (see also Expectation)
161, 303
- Sex**
466, 532, 555, 583, 592, 653, 793, 1031, 1239, 1283, 1374
- Sex Differences**
22, 464, 478, 480, 488, 510, 517, 530, 538, 540, 558, 559, 579, 632, 676, 683, 689, 697, 715, 778, 941, 952, 966, 971, 973, 976, 983, 1009, 1022, 1133, 1241, 1257, 1260, 1282, 1287, 1329, 1367
- Sex Differences-Animal**
395, 449, 450
- Sex Differences/Academic Achievement**
- Sex Role**
464, 529, 546, 577, 683, 693, 707, 712, 717, 1007, 1008, 1057
- Sexual Behavior**
245, 359, 396, 451, 454, 547, 553, 557, 561, 599, 899, 900, 906, 923, 995
- Sexual Behavior-Animal**
252, 333, 337, 395, 449, 450, 455, 457
- Sexual Deviation** (see also Homosexuality)

BRIEF SUBJECT INDEX

844, 904, 1003, 1004, 1005, 1006, 1008
Sexual Disorder
 598, 849, 1007, 1083
Shape Perception (SEE Perception/Form & Shape)
Shaping (SEE Conditioning)
Sheltered Employment (SEE Rehabilitation/Vocational)
Shock & Shock Intensity (see also Electroconvulsive Shock, Brain Stimulation, Rat/Brain Stimulation in, Rat/Shock & Shock Effects in)
 260, 421, 431, 432, 627
Shock Therapy (SEE Electroconvulsive Shock Therapy)
Shock/Electroconvulsive (SEE Electroconvulsive Shock)
Sibling (SEE Family Relations)
Signal
 122, 141, 423, 431, 911
Similarity
 165, 181, 186, 477, 623, 628, 650, 932, 964, 1055, 1410
Simulation (see also Model)
 75, 78, 114, 135, 136, 212, 1122
Size Constancy (SEE Gestalt Psychology, Visual Perception, Perception)
Size Perception (SEE Perception/Size)
Skin (see also Cutaneous Sense)
 283, 325
Skin Resistance (SEE Skin, Galvanic Skin Response)
Sleep (see also Dream & Dreaming, Rapid Eye Movement)
 22, 240, 370, 371, 453, 896, 898, 1180
Slow Learners (SEE Learning Disorders, Mental Retardation)
Smell
 123, 251, 252, 322, 391, 448
Smoking
 128, 130, 405, 460, 668, 669, 794, 820, 821, 841
Social Processes (see also next headings, Interpersonal Processes)
 547, 893
Social Acceptance (SEE Acceptance, Social Approval)
Social Adjustment (SEE Adjustment/Personal & Social)
Social Approval (see also Acceptance)
 476, 536, 540, 605, 625, 646, 681, 683, 801, 1403
Social Attraction (SEE Interpersonal Attraction)
Social Behavior/Animal
 23, 245, 369, 392, 395, 396, 403, 424, 439, 450, 452, 453, 455, 456
Social Behavior/Human (see also Childhood/Social Behavior in)
 30, 626, 987, 1207, 1253, 1305
Social Casework
 754, 884, 1025, 1071, 1325
Social Change
 10, 34, 45, 551, 595, 596, 597, 601, 665, 726, 802, 823, 1198
Social Class (SEE Social Structure, Socioeconomic Status)
Social Deprivation (SEE Childhood/Disadvantaged, Socioeconomic Status)
Social Desirability (SEE Acceptance, Social Approval)
Social Distance (SEE Isolation, Social Approval)
Social Influence (see also Interpersonal Influence)
 481, 612, 622, 641, 790, 1018
Social Interaction
 30, 396, 631, 632, 690, 1124, 1187
Social Isolation (SEE Alienation, Isolation)
Social Mobility (see also Social Structure)
 1265
Social Model (SEE Social Processes, Social Structure)
Social Movements
 594, 596, 636, 665, 752
Social Perception
 463, 597, 611, 644, 646, 647, 648, 649, 650,

651, 652, 732, 751, 755, 762, 763, 766, 888, 1023, 1216, 1265, 1283, 1329, 1331, 1332, 1334, 1338, 1403, 1410, 1412.
Social Power (SEE Social Influence, Interpersonal Influence, Social Movements)
Social Psychiatry (SEE Psychiatry, Social Processes)
Social Psychology
 562, 564, 674
Social Reinforcement (SEE Reinforcement/Social)
Social Role (SEE Role)
Social Science
Social Structure (see also Socioeconomic Status)
 10, 571, 586, 644, 748, 893, 979, 1009
Social Welfare (SEE Social Casework)
Socialization
 369, 552, 570
Society (SEE Culture)
Socioeconomic Status (see also Social Structure)
 80, 488, 490, 517, 529, 530, 545, 571, 572, 573, 575, 576, 578, 592, 594, 743, 744, 816, 826, 837, 1125, 1257, 1259, 1260, 1265, 1283, 1285, 1336, 1347, 1400
Sociology
 32, 810, 919
Sociometric Status (SEE Social Approval)
Sociometry (SEE Social Approval)
Sociopathy (SEE Behavior Problems, Crime & Criminals, Antisocial Behavior)
Sodium Chloride (SEE Food, Biochemistry)
Soldier (SEE Personnel/Military)
Somesthesia (see also Kinesthesia, Cutaneous Sense)
 233, 285, 293, 307, 1170
Sorting (SEE Categorical Behavior)
Sound (see also Audition, Noise)
 117, 118, 119, 120, 296, 478, 526, 527, 1136, 1199
Space Flight (SEE Aviation, Environment, Simulation)
Space Orientation (SEE Orientation)
Space Perception (SEE Perception/Space)
Special Education (SEE Education/Special)
Speech (see also next headings, Verbal Behavior)
 290, 375, 386, 653, 658, 1086, 1140, 1381
Speech Perception
 514, 526, 527, 1142
Speech Therapy
 386, 1064, 1135
Speech/Defective (see also Speech Therapy, Stuttering)
 904, 1098, 1135, 1136, 1138, 1139, 1140, 1141, 1142, 1171, 1178, 1291
Speed (SEE Movement)
Spiral Aftereffect (SEE Aftereffect)
Sports (SEE Recreation, Education/Physical)
Stammering (SEE Stuttering)
Stanford-Binet Intelligence Scale (SEE Test/Intelligence)
Starle (SEE Response)
Statistics (see also Mathematics, Factor Analysis)
 58, 61, 62, 63, 64, 65, 66, 67, 68, 70, 71, 72, 74, 123, 210, 294, 703, 731, 867, 932, 933, 943, 949, 950, 951, 961, 964, 970, 1056, 1060, 1172, 1362
Stains (SEE Social Structure, Socioeconomic Status)
Stereotype (see also Attitude)
 568, 572, 604, 644
Stimulant (SEE Drugs)
Stimulation
 75, 113, 125, 220, 293, 294, 307, 454, 471, 514
Stimulation/Central (SEE Brain Stimulation, Rat/Brain Stimulation in)
Stimulus
 123, 143, 145, 165, 169, 311, 421, 562, 1217, 1218, 1223
Stimulus Generalization (SEE Generalization)
Stimulus Intensity (see also Shock & Shock Intensity)
 88, 117, 123, 141, 276, 283, 415

Strategy
 160, 497, 499, 1226
Stress (see also Conflict, Stress/Physiological, Rat/Stress Effects in)
 61, 134, 136, 137, 378, 669, 904, 1026, 1027, 1036, 1074, 1093, 1238, 1324
Stress/Physiological
 378, 379, 381
Stroke (SEE Brain Disorder, Cardiovascular Disorders)
Strong Vocational Interest Blank (SEE Occupational Interest)
Student (see also next headings, School Dropout)
 375, 596, 688, 699, 986, 1262, 1338, 1358
Student Attitude (SEE Attitude/Student)
Student Dropout (SEE School Dropout)
Student Protest (SEE Social Movements, Attitude/Student)
Student Teacher (SEE Teacher Training)
Student/College (see also Achievement/Academic-College)
 594, 616, 636, 653, 684, 981, 1260, 1274, 1278, 1281, 1317, 1352, 1396
Student/College-Attitude
 586, 599, 612, 687, 1257, 1275, 1280, 1349, 1365
Student/College-Personality
 640, 677, 681, 686, 691, 693, 694, 1256, 1313, 1316, 1318, 1324, 1330, 1341, 1355, 1364
Student/Elementary School (see also Childhood & Children, Achievement/Academic-Elementary School)
 479, 650, 697, 1267, 1279, 1282, 1286, 1290, 1293, 1295, 1336, 1337, 1347, 1351, 1359, 1371, 1376, 1379, 1382
Student/Gifted (SEE Gifted)
Student/Graduate
 50, 140, 768, 779, 1289, 1330, 1378
Student/High School (see also Adolescence)
 569, 571, 575, 590, 592, 716, 717, 1266, 1283, 1363, 1379
Student/Junior High School (see also Adolescence)
 1264, 1268, 1277, 1303, 1351, 1360, 1379, 1386
Stuttering (see also Speech/Defective)
 1136, 1137
Subception (SEE Perception, Visual Perception)
Subliminal Perception (SEE Perception, Visual Perception, Threshold)
Submission (SEE Dominance, Interpersonal Influence)
Suburbs (SEE Urban & Suburban Environment)
Success (SEE Achievement)
Sucking (SEE Instinctive Behavior)
Suggestibility (SEE Hypnosis, Personality Trait)
Suicide (see also Death)
 722, 725, 971, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 1013, 1019
Superego (SEE Psychoanalytic Theory)
Supervision (SEE Leadership, Management)
Surgery (see also Medicine)
 1081, 1236, 1244
Survey (see also Inventory, Questionnaire, Scale, Testing Methods)
 80, 670, 1360
SVIB (SEE Occupational Interest)
Symbol & Symbolism (SEE Meaning, Communication, Language)
Sympathetic Nervous System (SEE Nervous System/Autonomic)
Symposium
 33, 35, 37, 38, 39, 40, 42, 47, 52, 53, 194, 215, 378, 384, 482, 492, 549, 786, 994, 1106, 1273, 1291, 1319, 1414
Symptom (see also Diagnosis, Psychodiagnostics)
 902, 922, 931, 944, 948, 959, 984, 1043, 1044, 1073, 1097, 1146, 1147, 1155, 1158, 1164, 1174, 1240
Syntax (see also Grammar)
 1219

BRIEF SUBJECT INDEX

Systems Analysis (SEE Organizational Structure)

Tachistoscope (SEE Apparatus)

Tactile (SEE Cutaneous Sense)

Talent (SEE Ability)

Target (SEE Engineering Psychology, Military)

Task

181, 1020, 1403

Taste (see also Food)

124, 367, 406, 410, 418, 445

Teacher

571, 605, 650, 774, 969, 998, 1212, 1266, 1331, 1332, 1334, 1336, 1339, 1340, 1342, 1343, 1344, 1354, 1366, 1379

Teacher Attitudes & Personality

605, 998, 1204, 1283, 1335, 1337, 1338, 1341, 1355

Teacher Training

710, 1282, 1311, 1335, 1337, 1338, 1339, 1341, 1366

Teaching (see also next headings)

779, 1258, 1263, 1273, 1329, 1333, 1337, 1368, 1371, 1372, 1375

Teaching Aids (see also Programed Instruction)

773, 892, 1200, 1277, 1300, 1309, 1380, 1388, 1389, 1390, 1391

Teaching Method (see also Programed Instruction)

774, 963, 1261, 1279, 1290, 1300, 1302, 1304, 1309, 1339, 1366, 1369, 1376, 1377, 1378, 1379, 1380, 1382, 1384, 1386, 1399

Teaching/Television (SEE Television)

Team Teaching (SEE Teaching Method)

Telepathy (SEE Parapsychology)

Television

21, 135, 643, 1092, 1200, 1277

Television/Educational (SEE Television)

Temperature

234, 325, 335, 353, 354, 383, 384, 891

Temperature Sense (SEE Cutaneous Sense)

Tension (SEE Conflict, Stress, Anxiety)

Territorial Behavior (SEE Instinctive Behavior)

Test & Testing (see also next headings. Projective Technique, specific tests)

79, 474, 483, 575, 916, 1138, 1284, 1288, 1289

Test Anxiety

530, 1285

Test/Ability (SEE Test/Aptitude)

Test/Achievement

494, 510, 527, 550, 1271, 1307, 1350, 1359, 1367, 1376

Test/Aptitude

503, 507, 574, 696, 1271, 1285, 1287, 1356

Test/Intelligence

348, 464, 511, 517, 695, 697, 699, 701, 926, 934, 937, 938, 993, 1015, 1054, 1191, 1213, 1350, 1356, 1358, 1359, 1367, 1369

Test/Personality

204, 576, 627, 669, 672, 678, 689, 693, 701, 706, 707, 708, 710, 712, 713, 716, 926, 927, 931, 946, 959, 961, 966, 972, 993, 1015, 1022, 1177, 1256, 1271, 1355, 1363, 1369, 1409

Testing Methods

664, 697, 934

Thalamus

227, 239, 261, 1175

Thematic Apperception Test (SEE Projective Technique)

Theory (see also Learning Theory, Personality Theory, Psychoanalytic Theory, Information Theory, Motivation Theory, Reinforcement Theory)

5, 8, 17, 29, 223, 394, 456, 633, 936, 1085, 1110

Therapeutic Community (SEE Community, Psychotherapy/Methods in)

Therapeutic Process (see also Empathy)

738, 740, 768, 769, 792, 798, 808, 817, 818, 826, 827, 829, 830, 832, 833, 834, 836, 838,

844, 848, 850, 852, 942, 1033

Therapist

740, 751, 793, 799, 804, 817, 826, 836, 840, 1067

Therapy (see also Behavior Therapy, Drug

Therapy, Family Therapy, Psychiatry, Psychoanalysis, Psychotherapy, Speech Therapy, Treatment, Schizophrenia/Treatment of, Mental Retardation/Treatment of, Case Report-Treatment, Electroconvulsive

Shock Therapy, Treatment/Outpatient, Psychiatric Patient Treatment, Occupational & Physical Therapy)

886, 894, 1035, 1064, 1139, 1157, 1207, 1240

Thinking (see also Cognition, Logic, Categorical Behavior)

202, 204, 207, 208, 213, 484, 489, 504, 522, 704, 1098, 1133, 1361, 1368

Thirst (SEE Water & Water Intake, Deprivation, Motivation)

Threat

Threshold

90, 100, 120, 122, 250, 274, 277, 862, 1199

Time (see also Perception/Time, Reaction Time)

199, 218, 891, 986

Time Estimation

Time Interval Effects (SEE Interval/Time, Interval/Interstimulus)

Token (SEE Reinforcement)

Tone (SEE Sound)

Touch (SEE Cutaneous Sense)

Tracking (SEE Visual Perception)

Training (see also Teacher Training)

499, 597, 621, 640, 642, 1400, 1417

Training/Industrial & Military

688, 1399, 1404

Training/Psychology

33, 34, 46, 700, 744, 746, 747, 749, 753, 758, 759, 760, 761, 762, 764, 767, 768, 771, 772, 773, 774, 775, 776, 777, 780, 781, 785, 825, 840, 892, 963, 1328

Training/Teacher (SEE Teacher Training)

Trait (SEE Personality Trait)

Tranquilizer (see also Drug Therapy, Chlorpromazine)

667, 866, 868, 870, 974, 1061, 1068, 1093

Transfer (see also Generalization, Learning Transfer)

161, 425

Transference (SEE Therapeutic Process, Interpersonal Processes)

Transsexualism (SEE Sexual Deviation)

Transvestism (SEE Sexual Deviation)

Trauma (SEE Stress, Emotion)

Treatment (see also Therapy, Schizophrenia/Treatment of, Case Report-Treatment, Mental Retardation/Treatment of)

731, 754, 940, 942, 944, 949, 975, 1001, 1019, 1125, 1160, 1165

Treatment/Outpatient

779, 842, 881, 882, 890, 930, 959, 1232, 1246

Trust (SEE Interpersonal Processes, Social Perception)

Tuberculosis (SEE Disease)

Twins (see also Genetics, Family Relations)

386, 736, 1036, 1059, 1087

Ulcer (SEE Illness)

Unconscious (SEE Motivation, Conscious States, Psychoanalytic Theory)

Underachievement (SEE Achievement/Over & Under)

Underdeveloped Countries (SEE Cultures & Countries)

Undergraduates (SEE Student/College)

Underprivileged (SEE Socioeconomic Status, Childhood/Disadvantaged)

Underwater Environment (SEE Environment)

Unemployment (SEE Personnel/Industrial, Socioeconomic Status)

Union (SEE Personnel/Industrial)

United States

339, 501, 570, 584, 585, 587, 803, 807, 846, 1256

University (SEE College, Student/College)

Unwed Mother (SEE Pregnancy, Mother)

Urban & Suburban Environment (see also Community, Rural Environment)

516, 557, 558, 574, 576, 591, 595, 715, 744, 1131, 1264, 1400

Urination (SEE Elimination)

USSR

7, 10, 14, 16, 17, 19, 51, 52, 54, 138, 319, 384, 482, 485, 489, 492, 549, 558, 647, 674, 675, 994, 1269, 1270, 1273, 1291, 1319, 1346, 1383, 1387, 1414

Validity

63, 68, 88, 488, 575, 627, 705, 708, 710, 977, 1054, 1056, 1232, 1257, 1274, 1284, 1301, 1401, 1406

Validity/Construct (SEE Validity)

Value & Values

462, 481, 542, 557, 565, 790, 1002, 1282, 1315, 1332, 1403, 1405

Variance/Analysis of (SEE Statistics)

Vascular & Vasomotor (SEE Cardiovascular Processes)

Verbal Ability (SEE Ability, Verbal Behavior)

Verbal Behavior (see also Communication, Speech, Vocalization)

156, 184, 386, 487, 506, 534, 535, 540, 545, 654, 658, 704, 797, 840, 848, 946, 1048, 1075, 1133, 1141, 1215, 1286, 1293, 1298, 1335, 1339

Verbal Conditioning (SEE Learning/Verbal)

Verbal Learning (SEE Learning/Verbal)

Verbal Meditation (SEE Meditation)

Verbal Reinforcement (SEE Reinforcement/Social)

Vestibular Sense (SEE Somesthesia)

Vibration (SEE Cutaneous Sense, Stress, Stimulation)

Vigilance (SEE Arousal, Attention)

Violence (SEE Aggression, Conflict, Hostility)

Vision (SEE also next headings, Eye, Eye Movement, Retina, Intersensory Processes)

85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 139, 196, 202, 243, 253, 288, 297, 301, 304, 311, 393, 514, 560, 604, 1286

Vision/Binocular (SEE Vision, Perception/Depth)

Vision/Color (SEE Color Vision)

Vision/Defective

93, 110, 255, 313, 1077, 1127, 1128, 1130, 1131, 1132, 1139, 1286

Vision/Physiology of

101, 105, 253, 262, 297, 298, 316, 317, 319, 320, 321, 324, 327, 458

Visual Adaptation (SEE Adaptation/Sensory)

Visual Aftereffect (SEE Aftereffect)

Visual Cortex

238, 255, 260, 312

Visual Discrimination

89, 91, 92, 171, 242, 247, 254, 256, 257, 260, 261, 312, 323, 423, 425, 506, 1202

Visual Field

89, 98, 109

Visual Illusion (SEE Illusion)

Visual Perception (see also Illusion, Perception, Color Vision)

83, 84, 91, 92, 95, 99, 100, 101, 102, 103, 104, 107, 108, 109, 184, 262, 327, 397, 704, 1304

Visual Perception/Depth (SEE Perception/Depth)

Visual Perception/Form & Shape (SEE Perception/Form & Shape)

Visual Perception/Size (SEE Perception/Size)

Visual Perception/Space (SEE Perception/Space)

Visual Threshold (SEE Vision, Threshold)

Vocabulary

512, 655, 698

Vocalization

215, 452

Vocation (SEE Occupation)

BRIEF SUBJECT INDEX

- Vocational Guidance** (SEE Guidance/Vocational)
Vocational Interest (SEE Occupational Interest)
Vocational Rehabilitation (SEE Rehabilitation/Vocational)
Voice (SEE Speech, Verbal Behavior, Vocalization)
Voting (SEE Political Behavior)
- Wage** (SEE Money)
WAIS (SEE Wechsler Adult Intelligence Scale)
War (see also International Relations)

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract, four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) Single cell activity in the hypothalamus in intact and adrenalectomized rats. (4) *Psychological Journal*, (5a) 1970(Jan), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.)—(10) *Journal abstract*.

- 1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.
- 2—Address: A mailable address is included for the first-named author only.
- 3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., [Parapsychology].
- 4—Primary journal title in full.
- 5a—Year and month of the primary publication issue.
- 5b—Volume number followed by issue number in parentheses.
- 5c—Inclusive pagination of the article.
- 6—Text of the abstract.
- 7—Reference to a previous entry in *Psychological Abstracts*.
- 7a—PA—*Psychological Abstracts*.
- 7b—PA volume number.
- 7c—PA abstract number.
- 7d—PA issue number where abstract number is unavailable at time of publication. When only the issue number is given, one must consult the Author Index of the PA issue noted in order to determine the abstract number for the author and article cited.
- 8—Summaries included in the primary source are listed when in language(s) other than that of the article.
- 9—Number of references is included when 15 or more. May also appear as pages, e.g., (3 p. ref.).
- 10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U. Chicago, Medical School*) (4) *Sleep and dreams*. (5) New York, N.Y.: (6) Appleton-Century-Crofts, (6a) 1970. (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper).

- 1—Name of author(s) or editor(s). If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.
- 2—Designation of editor.
- 3—Address of first-named author/editor only.
- 4—Book title.
- 5—Place of publication.
- 6—Publisher's name.
- 6a—Year of publication.
- 6b—Prepagination.
- 6c—Total pagination.
- 6d—Hardcover price.
- 6e—Paperback price.

BOOK CHAPTER ENTRY

(1) Wilson, J. T. (2) (*U. California, Santa Cruz*) (3) *The stages of sleep*. (4) In (4a) J. J. Jones (4b) (Ed.), (4c) "Sleep and dreams." (5) (See (5a) PA, (5b) Vol. 45: (5c) Issue 1) (6) 17-47.

- 1—Author(s) of chapter cited. If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.
- 2—Address of first-named author only.
- 3—Chapter title.
- 4—Reference to entry in PA which includes bibliographic information for the whole book. When only the issue number is given (see 5c), one must consult the Author Index of the PA issue noted in order to determine the abstract number for the Editor of the book.
- 4a—Editor's name.
- 4b—Editor designation.
- 4c—Book title.
- 5—Referral information.
- 5a—PA—*Psychological Abstracts*.
- 5b—Volume number.
- 5c—Issue number.
- 6—Inclusive pagination for cited chapter.

ABBREVIATIONS

Abbreviations appearing in this issue include along with units of measurement (e.g., in. = inch, wk. = week, hr. = hour, etc.):

AA = Alcoholics Anonymous
AC = alternating current
ACTH = adrenocorticotrophic hormone
AM = ante meridiem
amp. = ampere

bpm = beats per minute

C = centigrade
¢ = cents
CA = chronological age
cc = cubic centimeter
CER = conditioned emotional response
CFP = critical flicker frequency
CNS = central nervous system
cps = cycles per second
CR = conditioned response (or reflex)
CRF = continuous reinforcement
CRT = cathode ray tube
CS = conditioned stimulus
CVC = consonant-vowel-consonant

db. = decibel
DC = direct current
DL = differential limen
DNA = deoxyribonucleic acid
DRL = differential reinforcement of low rates

E = experimenter
ECS = electroconvulsive shock
EEG = electroencephalogram (or -graphy)
EKG = electrocardiogram
EMG = electromyogram
ESP = extrasensory perception
Exp. = experiment

F = Fahrenheit
ft-c = foot-candle
ft-L = foot-lambert

g = gravity
gm. = gram(s)
GPA = grade-point average
GSR = galvanic skin response

Hz. = Hertz

ICS = intracranial stimulation
im = intramuscularly
ip = intraperitoneally
IQ(s) = intelligence quotient(s)
ITI = intertrial interval
iv = intravenously

kc. = kilocycle
kg. = kilogram
kg/m = kilogram per meter
kHz. = kilo-Hertz

LD = lethal dose
LSD = lysergic acid diethylamide

m. = meter
M = mean
M = mole or molar
ma. = milliamperes
MA = mental age
MAO = monoaminooxidase
mL. = millilambert
mm. = millimeter
mph = miles per hour
msec. = millisecond(s)

N = number
NREM = nonrapid eye movement

O = observer

p = probability
% = percent

PM = post meridiem
pps = pulses per second
PRI = partial reinforcement effect
PSE = point of subjective equality
psi = pounds per sq. in.

r = product-moment correlation
r = roentgen
REM = rapid eye movement
rms = root mean square
RNA = ribonucleic acid
rpm = revolutions per minute
RT = reaction time

S = subject
SEU = subjectively expected utility
SPL = sound pressure level

TV = television

UCR = unconditioned response
UCS = unconditioned stimulus
UHF = ultrahigh frequency

V = volt
VHF = very high frequency
vs. = versus

YMCA = Young Men's Christian Association
YWCA = Young Women's Christian Association

Test abbreviations include:

California E Scale (Ethnocentrism)
California F Scale (Fascism)
CMA scale = Children's Manifest Anxiety scale
CPI = California Psychological Inventory
CTMM = California Test of Mental Maturity
EPPS = Edwards Personal Preference Schedule
MA scale = (Taylor) Manifest Anxiety scale
MMPI = Minnesota Multiphasic Personality Inventory
MPI = Maudsley Personality Inventory
16 PF = Cattell's 16 Personality Factor Questionnaire
SVIB = Strong Vocational Interest Blank
TAT = Thematic Apperception Test
WAIS = Wechsler Adult Intelligence Scale
WISC = Wechsler Intelligence Scale for Children

Abbreviations used in authors' addresses are:

Assn. = association
Assoc. = associates
Co. = company
Coll. = college
Corp. = corporation
Dept. = department
Div. = division
Inst. = institute
Hosp. = hospital
Lab. = laboratory
Inc. = incorporated
U. = university

Ave. = avenue
Bldg. = building
Blvd. = boulevard
Ct. = court
Dr. = drive
Ft. = fort
Mt. = mount
Pkwy. = parkway
Pl. = place
PO = post office
Rd. = road
St. = street
N, S, E, W = North, South, East, West
U.S. = United States
USSR = Union of Soviet Socialist Republic

Psychological Abstracts

VOLUME 45

FEBRUARY 1971

NUMBER 2

ERRATUM

In PA, Vol. 43:8980, the journal title should read: *Quarterly Journal of Experimental Psychology*.

GENERAL

OBITUARIES

1418. Kaneko, Takayoshi. (Tokyo U. of Education, Japan) **The late Professor Torao Obonal and his psychological works.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 186-188.—Recounts the life and work of 1 of Japan's outstanding and unique psychologists who died in 1968. The largest number (about 120) of his studies centered on sensation and perception. He was primarily an experimental psychologist in the orthodox Helmholtz-Wundt tradition.—R. D. Nance.

HISTORY

1419. Bordi, Sergio. (Istituto di Psicoanalisi, Rome, Italy) **La psicoanalisi e le scuole dissidenti.** [Psychoanalysis and dissident schools.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1970(Mar), Vol. 31(2), 131-143.—Presents a historical overview of 1st- and 2nd-generation revisionists of psychoanalysis.—L. L'Abate.

1420. Camfield, Thomas M. (U. Texas) **Psychologists at war: The history of American psychology and the First World War.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5370.

1421. Helson, Harry. (U. Massachusetts) **E. G. B.: The early years and change of course.** *American Psychologist*, 1970(Jul), Vol. 25(7), 625-629.—Discusses why E. G. Boring left the laboratory to become the foremost historian of experimental psychology. The position of psychology in general and at Harvard in particular in the mid-1920s is examined, and it is concluded that Boring turned to history because he could not accept the current phenomenological or behavioristic approaches. The *Zeitgeist* had rendered Titchenerian structuralism obsolete so it was natural for Boring to devote himself to the history of the great sensory tradition. His inclusion of James and Freud among the "very great" psychologists showed his growth in appreciation of men outside the structuralist school. Boring's career exemplified the positive and negative interactions of eponyms with the *Zeitgeist* which he maintained was an essential factor in the progress of science. (19 ref.)—*Author abstract*.

1422. Kantor, J. R. (U. Chicago) **Newton's Influence on the development of psychology.** *Psychological Record*, 1970(Win), Vol. 20(1), 83-92.—Although the eminence of Newton in mathematics, astronomy, and physics is universally known, his powerful and mis-

leading influence upon psychology is not generally appreciated. In accordance with the spiritistic philosophy current in his time, and on the basis of his prismatic color experiments, he constructed a model of perception which has dominated psychological thinking for centuries in complete variance from fact and naturalistic theory.—*Journal abstract*.

1423. Lapointe, Francois H. (Georgia Coll., Milledgeville) **Origin and evolution of the term "psychology."** *American Psychologist*, 1970(Jul), Vol. 25(7), 640-646.—Presents a historical review of the term "psychology." It is noted that while the word contains Greek elements, it does not have origins in Greek antiquity. This study suggests that the word originated in the 16th century "to refer to 1 aspect of spiritual being" and was 1st used as a title of academic lectures by Philipp Melancthon (1497-1560). Further development of the term through the mid-19th century is presented, including a table providing a chronology from Melancthon through Herbert Spencer's "Principles of Psychology" (1855). (25 ref.)—P. McMillan.

1424. Siegmund, Georg. (28 Abt-Richard-Str., Fulda/Neuenberg, W. Germany) **Pawlos Kampf gegen die Seele.** [Pavlov's fight against soul.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 24-40.—Presents a concise, comprehensive biography of Pavlov. (30 ref.)

PHILOSOPHY

1425. Eccles, J. C. **The importance of brain research for the educational, cultural, and scientific future of mankind.** *Perspectives in Biology & Medicine*, 1968(Fal), Vol. 12(1), 61-68.—Presents a philosophical discussion of consciousness as an emergent property of neural activity having causal efficacy, this opposing epiphenomenal view. The fundamental importance of consciousness of self to each individual renders inadequate "the materialistic, mechanistic, behavioristic, and cybernetic concepts of man, which at present dominate research." It is argued that the process of creative evolution cannot alone explain origin of self. An appeal is made to scientists to admit to their values as well as to the limits of their ability to offer final causal explanations.—J. Crabbe.

1426. Khlystova, Z. S. (USSR Academy of Medical Sciences, Research Lab. for Experimental-Biological Models, Moscow) **Filosofskoe osveshchenie vzaimootnoshenii struktury i funktsii v modelirovani tkanykh protsessov.** [Philosophical illumination of the interrelationships between structure and function in simulating tissue processes.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 15-17.—Presents a philosophical analysis, confirming that structure and function are labile in their continuous interaction with the factors of the external and internal environment of man.—I. D. London.

1427. Leont'ev, A. N. (Moscow State U., USSR) **Chuvstvennyi obraz i model' v svete leninskoï teorii otrazheniya.** [Mental representations versus models in the light of Lenin's theory of reflection.] *Voprosy Psikhologii*, 1970(Mar), Vol. 16(2), 34-45.—Discusses the similarities and dissimilarities between mental representations and various kinds of models in terms of Lenin's theory of reflection. Although mental representations may be described as a kind of model, they are incomparably richer in content than any physical model since they are included in the system of relationships of objective reality rather than being passive mirror images of the parameters of an isolated object. (English summary)—*L. Zusne.*

1428. Manina, A. A. (Inst. of Experimental Medicine, Leningrad, USSR) **Vzaimosvyaz' struktury i funktsii v norme i pri patologii.** [Interconnection of structure and function in the normal state and in pathology.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 26-31.—Presents a Marxist analysis at the subcellular level.—*I. D. London.*

1429. Moed, H. K. (U. Amsterdam, Lab. of Psychology, Netherlands) **Constancy and contrast: IIC.** *Acta Psychologica, Amsterdam*, 1970(Jun), Vol. 32(3), 205-268.—Discusses the "distinction between the inner and the outer process in the description of perception [which] does not conform to the usual distinction between the inner and the outer 'world'."

1430. Moraczewski, Albert. (Texas Medical Center, Inst. of Religion, Houston) **The divorce of psyche and soma.** *Psychosomatics*, 1970(May), Vol. 11(3), 151-156.—Considers the problem of how biological and psychological information can be reconciled into a unity represented by the pronoun "I." The mind-body problem is reexamined from 3 viewpoints: (a) relating subjective experience to neurochemical phenomena, (b) relating neuronal activity to subjective experience, and (c) developing information from split-brain experimentation. Despite these evidences of dualism, it is contended that an overriding characteristic of an organism is its obvious behavioral unity. Thus the tendency in medicine and psychiatry to divide the psyche and soma is only an attempt to better understand the relationship between the 2 aspects of man. (18 ref.)—*P. McMillan.*

1431. Natanson, Maurice. (U. California, Santa Cruz) **Other selves.** In M. Natanson, "The journeying self: A study in philosophy and social role." (See PA Vol. 45:Issue 2) 27-46.

1432. Natanson, Maurice. (U. California, Santa Cruz) **The journeying self: A study in philosophy and social role.** Reading, Mass.: Addison-Wesley, 1970. ix, 262 p. \$3.95(paper).

1433. Natanson, Maurice. (U. California, Santa Cruz) **The self.** In M. Natanson, "The journeying self: A study in philosophy and social role." (See PA Vol. 45:Issue 2) 8-26.

1434. Perkins, Richard B. **A critique of the contemporary concept of visual space and the visual-physical space dichotomies.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Oct), Vol. 46(10), 755-759.—Discusses and analyzes the source of the gross ambiguity which exists in the literature regarding the meaning of the concept of visual space and physical space. 2 different concepts of consciousness are suggested in place of the former visual-physical space dichotomy.—*Journal abstract.*

1435. Sarkisov, D. S. (Vishnevskii Inst. of Surgery, Moscow, USSR) **Sovremenniy etap v razviti pre-**

dstavlenii o edinstve struktury i funktsii. [Current stage in the development of concepts concerning the unity of structure and function.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 17-25.—Presents a historical survey and an analysis of the current stage of understanding of the unity of structure and function, including the problem of the primary and the secondary.—*I. D. London.*

1436. Siguan-Soler, Miguel. (U. Barcelona, Spain) **Mensche und Zeitlichkeit.** [Man and temporality.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 12-24.—Presents a philosophical discussion of temporality. The 1st form in which temporality occurs is that of the volatility of reality. While man attempts to "objectify" time through concept building (i.e., 1 hr., 1 yr.), time spans are perceived differently by individuals. Man is not temporal while he is a spectator of changing reality; his temporality lies in his destination to die.—*B. A. Stanton.*

1437. Strigacheva, E. I. **Strukturnye osnovy edinstva, razlichiya i vzaimosvyazi form patologicheskogo protessa (filosofskii aspekt).** [Structural bases of unity, difference and interconnection in the forms of the pathological process (philosophical aspect).] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 6-14.—Presents a philosophical analysis, demonstrating that even the "destructive process" has its laws of development, "regress" having its counterpart in "progress."—*I. D. London.*

PARAPSYCHOLOGY

1438. Joesting, Robert & Joesting, Joan. (Challenge Foundation, Chapel Hill, N.C.) **Position effects and target material in ESP.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 75-78.—The 1st and 3rd segments of a mail-in precognition test involving over 100,000 adolescents used standard ESP targets while the 2nd and 4th segments used words as targets. 50 male and 50 female protocols with high scores on the 1st segment and low scores on the 2nd segment were used in the pilot study, there being twice as many of each sex for the replication. Both pilot and replicating studies show significantly higher scoring on the 4th segment than on the 3rd.—*Journal abstract.*

THEORY & SYSTEMS

1439. Anastasi, Anne. (Fordham U.) **On the formation of psychological traits.** *American Psychologist*, 1970(Oct), Vol. 25(10), 899-910.—Discusses mechanisms whereby the traits identified through factor analysis may be formed. R. C. Tryon's 3-pronged analysis of the origin of traits, the overlapping of psychological components, correlations between independent environmental fields, and correlations between independent gene blocks are examined. Subsequent theoretical developments in terms of such mechanisms as transfer, generality of concepts, learning sets, Piaget's operations, problem-solving styles, and cognitive strategies are also discussed. Relevant research following developmental, comparative, and experimental approaches is surveyed. (72 ref.)—*Author abstract.*

1440. Auersperg, Alfred. (963 Casilla, Concepción, Chile) **Genetisch-interpretierte Informationstheorie und kybernetisch-orientierte Informationstheorie im Lichte der Energielehre von Teilhard de Chardin.** [Genetically-interpreted information theory and cyber-

netic-oriented information theory in light of Teilhard de Chardin's energy precept.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 88-99.—Discusses the heuristic orientation of the genetic information theory vs. Norbert Wiener's neodeterministic approach (objective determinism) to cybernetics.

1441. Caruso, Igor A. (45 Lainzerstr., Vienna, Austria) **Über einige Aspekte der Forschung und Praxis in der Tiefenpsychologie.** [Several aspects of research and practice in depth psychology.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 199-207.—Cites numerous regional organizations of depth psychologists in Europe and Latin America and discusses future goals for the formation of an international association of depth psychologists. The impact of social forces on current research and practice in depth psychology is emphasized.—B. A. Stanton.

1442. Lambley, Peter. (U. Cape Town, South Africa) **Psychology and epistemology: Operationism revisited.** *Psychological Record*, 1970(Spring), Vol. 20(2), 229-234.—Reappraised the position of operationism in the light of P. W. Bridgman's later epistemology. It is argued that operationism, as it was applied in psychology, was used as a panacea-like answer to all problems of meaning. To avoid the extremities of such a formulation the epistemological value of using operationism as a tool to understand the complexities of investigation is advocated. (22 ref.)—*Journal abstract.*

1443. Pongratz, Ludwig J. (U. Würzburg, Psychologische Inst., W. Germany) **Das Logogramm der Psychologie.** [The logogram of psychology.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 67-76.—Examines 4 aspects of the psychological life of the individual: the conscious, the unconscious, feelings, and behavior. A diagrammatic representation (logogram) of the order and mutual interaction of these 4 factors is presented.—B. A. Stanton.

1444. Danks, Joseph H. & Glucksberg, Sam. (Kent State U.) **Psychological scaling of linguistic properties.** *Language & Speech*, 1970(Apr), Vol. 13(2), 118-140. Examined adults' abilities to judge selected properties of sentences in 3 studies. In the 1st 2, Ss rated the grammaticalness of sentences varying in grammaticalness according to linguistic theory. The judgments showed high within-S consistency and between-Ss agreement. The resultant scales were linear, indicating that grammaticalness may be viewed as a unitary dimension. There was, however, some indication that differential interpretability affected the judgments. In the 3rd study, Ss rated sentences on the basis of: (a) grammaticalness, (b) meaningfulness, (c) familiarity, or (d) ordinariness. Using a principal components analysis of the ratings, grammaticalness and meaningfulness were represented by orthogonal factors while familiarity and ordinariness could not be distinguished from one another. Implications of the data for the relations between linguistic and psychological analyses of language and language behavior are examined. (23 ref.)—*Journal abstract.*

py/counseling training: On the dimensions of interpersonal perception, conflict confrontation, and levels of supervisor offered conditions. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5685-5686.

1446. Gabriel, Hugh P. & Danilowicz, Delores A. (New York U., Medical School) **Psychiatric concepts in pediatric residencies: A review of NIMH-supported training programs.** *Journal of Medical Education*, 1969(Oct), Vol. 44(10), 939-944.—Describes several programs designed to provide pediatric residents with some knowledge of mental health. The collaborative attempts by the departments of pediatrics and psychiatry have provided important advances in medical education; but to date these programs have not been organized to provide necessary information about the relative value of their content and teaching methodology. It is hoped institutions planning similar collaborative curricula will not only utilize the information obtained from these earlier programs but will structure their efforts so that the efficacy of the results can be assessed. Only in this way can medical education be effectively advanced.—*Journal summary.*

1447. Katahn, Martin. (Vanderbilt U.) **A survey of the interest in continuing education among mental health professionals in the Southeastern states.** *American Psychologist*, 1970(Oct), Vol. 25(10), 941-952.—Describes a questionnaire sent to 600 mental health professionals, designed to determine their interest in a university sponsored interdisciplinary center for continuing education. Data indicate that areas of greatest interest were behavior modification, drug/alcohol usage, and community mental health (including consultation, family group therapy, crisis intervention, and training of lay personnel). 70% of respondents indicated interest in learning practical applications of operant methodology and behavior therapy. Most respondents indicated satisfaction with previous continuing education experiences. Since a majority received their highest degree at least 5-10 yr. before, it is suggested that a definite need exists for programs designed to help professionals update their knowledge and skills. A center for advanced study currently operating in the Southeastern United States is described.—*Author abstract.*

1448. Keller, Fred S. (3532 Old Colony Rd., Kalamazoo, Mich.) **Comments and queries: "English spoken here."** *Psychological Record*, 1970(Spring), Vol. 20(2), 259-262.—The classical requirement of foreign-language reading knowledge for doctoral candidates in psychology has failed to provide the community of scholars that was its aim. An alternative is suggested which places the learning of a 2nd language within a larger international context and gives greater meaning to other-language mastery at lower educational levels.—*Journal abstract.*

1449. Philippot, M. & Chevolet, D. (Faculté des Lettres et Sciences Humaines, Rennes, France) **A propos de la formation des étudiants en psychologie: Une cinquième faculté est-elle nécessaire?** [On the training of psychology students: Is a new school necessary?] *Information Psychologique*, 1968(Apr), No. 30, 37-50.—Reviews the present curriculum, and suggests that more emphasis be placed on (a) case discussions, (b) sensitivity training, (c) training in group relations, and (d) role playing. It is suggested that this is enough of a departure from the usual behavior pattern in most of the universities to require the organization of a new unit.—S. G. Vandenberg.

EDUCATION & TRAINING

PROFESSIONAL DEVELOPMENTS

1450. Fine, Reuben. (225 W. 86, New York, N.Y.) **Psychoanalysis, psychology and psychotherapy.** *Psychotherapy. Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 120-124. "... it is simply absurd that when the student takes psychology he will learn in detail the RIs for all the major senses, the perception of colors, the laws of learning, etc., but will be taught nothing about love, sex, the family, war, crime or artistic creativity." An urgent plea in made for the "sincere acceptance of psychoanalysis by psychology." This would involve 5 substantial changes in the present academic structure of psychology. (22 ref.) H. K. Moore.

1451. Kohut, H. **Scientific activities of the American Psychoanalytic Association: An inquiry.** *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 462-484. Presents a slightly altered version of the final report of the Ad Hoc Committee on Scientific Activities presented in 1969 to the Executive Council of the American Psychoanalytic Association. The task of the committee was to survey the current state of psychoanalytic scientific activities and to assess the role played by the Association with regard to them.—D. Prager.

1452. Spiegel, Don & Keith-Spiegel, Patricia. (Brentwood Hosp., Veteran Administration Center, Los Angeles, Calif.) **Assignment of publication credits: Ethics and practices of psychologists.** *American Psychologist*, 1970(Aug), Vol. 25(8), 738-747. Reports results from respondents (454 American Psychological Association members, 261 psychologists with 5 or more publications, and 117 Veterans Administration psychologists) to a questionnaire concerned with publication credit practices in collaborative research situations. Questionnaire items were presented in terms of hypothetical situations requiring multiple-choice responses in the areas of the paid consultant, continuing research team, authorship order when contributions are equal, and a variety of classes of research assistants. Tentative guidelines are presented on the basis of results obtained. In general, it is noted that neither power nor status should determine credit assignment.—P. McMillan.

1453. Wolff, Wirt M. (U. Texas, Medical School, Dallas) **A study of criteria for journal manuscripts.** *American Psychologist*, 1970(Jul), Vol. 25(7), 636-639. Surveyed 66 editors of certain clinical-personality journals as to their rankings of, and comments, about 15 manuscript criteria. Findings show high interjudge agreement and a significant consensus in a comparable study of related journals. Results reflect agreements among judges of journal articles that could expedite manuscript preparations. (17 ref.)—Author abstract.

INTERNATIONAL PSYCHOLOGY

1454. Melekhov, D. E. **Sotsial'noe i trudovoe ustroistvo psikhicheskii bol'nykh i invalidov v SSSR.** [Social and occupational rehabilitation of mental patients and the incapacitated in the USSR.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 161-167. Presents a survey of the development and characteristics of social psychiatry in the Soviet Union, and its influence on the development of social psychiatry in other countries. (30 ref.)—I. D. London.

1455. Rozanova, T. **XIX Mezhdunarodnyi psikhologicheskii kongres.** [19th International Psychological

Congress.] *Defektologiya*, 1970, Vol. 2(1), 91-94.—Presents summaries of papers read at the 1969 Congress, held in London, which deal with mental capacities and functional abilities of normal and handicapped children.—I. D. London.

1456. Whittaker, James O. (Pennsylvania State U., Psychosocial Lab., Middletown) **Psychology in China: A brief survey.** *American Psychologist*, 1970(Aug), Vol. 25(8), 757-759.—Discusses evidence that psychology still exists as a viable profession within China. 3 specialties appear to predominate: medical (or clinical), educational, and industrial. Graduate training is available in these specialties at a few universities including Peking. Research is carried out mainly at the Chinese Academy of Sciences in Peking and Peking University, although educational research in psychology is probably conducted more widely. Although professional psychology is quite limited, perhaps as many as 40,000-50,000 students are enrolled in lower-level psychology courses.—Author abstract.

1457. Jones, Richard M. (State U. New York, Old Westbury) **Possible functions of dreaming.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 335-344.

GENERAL BOOKS & REFERENCE WORKS

METHODOLOGY & RESEARCH TECHNOLOGY

1458. Brown, Steven R. (Kent State U.) **On the use of variance designs in Q methodology.** *Psychological Record*, 1970(Spr), Vol. 20(2), 179-189.—Misgivings concerning the use of variance design and analysis in the structuring and evaluation of Q samples derive from the basic assumptions of deductive methodologies. Several alternative uses of variance design, as discussed by W. Stephenson, are suggested. Criticism of Stephenson's use of factorial arrangement is based on a misunderstanding of his position, too strict a reliance on the logical properties of Q samples, and failure to realize the synthetic quality of self-referent statements. Principles are illustrated with empirical examples.—Journal abstract.

1459. Feldman, Carol F. & Hass, Wilbur A. (U. Chicago) **Controls, conceptualization, and the interrelation between experimental and correlational research.** *American Psychologist*, 1970(Jul), Vol. 25(7), 633-635.—Studies of the correlational type allow direct inferences about population differences, and indirect inferences about their causes. Studies of the experimental type allow direct inferences about situational factors, and indirect inferences about the behavior of individuals in general, in natural situations. Both types require controls of analogous forms to support the full range of inference-making and psychological conceptualization. It is with respect to such conceptualization that efforts at control must be evaluated.—Author abstract.

1460. Kalinovskii, A. P. **Printsipy postroeniya nekotorykh avtomatizirovannykh sistem obrabotki fiziologicheskoi informatsii.** [Principles underlying the construction of some automatized systems for the treatment of physiological information.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta* (See PA, Vol. 45:Issue 2) 182-185.—Examines the process of treating physiological information

as consisting of (a) primary treatment, i.e., isolation of a number of defined physiological indices from the general flow of data, measurements of values, and transformations into a form suitable for analysis; and (b) secondary treatment or analysis, whose goal and character are determined by the aims of the research and the conditions under which it is conducted.—*I. D. London.*

1461. Khumal', Kh. A. **Vysokoplotnaya sistema magnitnoi tsifrovoy zapisi dlya nakopleniya fiziologicheskoi informatsii bol'shogo ob'ema s posleduyushchim avtomaticheskim vvodom v ETsVM.** [High-density system for a magnetic digital record to store physiological information of great volume with subsequent automatic lead into an electronic computer.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45: Issue 2) 170-173.—Describes a method of initial registration of information in digital form with the possibility of reproduction in analogous form, and direct lead into an electronic computer. In order to secure a sustained continuous recording, special methods for the synchronization and demarcation of zones, and a leading-in device affixed to the electronic computer are developed.—*I. D. London.*

1462. Lachenmeyer, Charles W. (Franklin Delano Roosevelt Veterans Administration Hosp., Montrose, N.Y.) **Experimentation: A misunderstood methodology in psychological and social-psychological research.** *American Psychologist*, 1970(Jul), Vol. 25(7), 617-624.—Attempts to place experimental methodology in its proper perspective in psychological and social psychological research. Deficiencies in traditional definitions of experimentation are examined, and an alternative conceptualization is proposed that more closely satisfies the fact of continuity between all scientific investigative procedures. A typology of experimentation is also proposed based on the functions of experimentation vis-à-vis the theory construction process. Results of the narrow conceptualization of experimental methodology extant in present research is discussed. Finally, a strategy of research is proposed that will be fundamental to the eventual development of psychological and social psychological theory. (34 ref.)—*Author abstract.*

1463. Maklyukov, M. I. **Inzhenernye metody sinteza aktivnykh RC-ili'trov diya fiziologicheskoi apparatury.** [Engineering methods for the synthesis of RC-active filters for physiological instrumentation.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45: Issue 2) 115-122.—Presents a synthetic method for calculating RC-active filters in accordance with given frequency characteristics. Application of the Butterworth and the Chebyshev approximating functions was handled through regenerative links having low and high frequency, and frequency range characteristics.—*I. D. London.*

1464. Parin, V. V. (Ed.) **Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.** [Contemporary apparatus and technique in physiological experimentation.] Moscow, USSR: Nauka, 1969. 296 p. Presents a collection of 67 articles on (a) the construction of apparatus and the theory in physiological research, and (b) "the methodology of their application" in physiological experimentation. The collection represents an issue of the series *Problemy Biologicheskoi Kibernetiki* [Problems of Biological Cybernetics].—*I. D. London.*

1465. Shadrintsev, I. S., Magedov, V. S., & Kozharikov, V. I. **Uplotnenie fiziologicheskoi informatsii v telemetricheskikh kanalakakh svyazi.** [Condensation of physiological information in telemetric communication channels.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45: Issue 2) 178-182.—Examines a number of questions connected with the transmission of a great volume of physiological information through telemetric communication channels with limited carrying capacity. Various procedures leading to condensation of transmitted information (preliminary measurements, preliminary statistical treatment, short-interval sampling, focus on only significant deviations, etc.) are explored.—*I. D. London.*

1466. Smith, Nathaniel C. (Ohio State U.) **Replication studies: A neglected aspect of psychological research.** *American Psychologist*, 1970(Oct), Vol. 25(10), 970-975.—A survey of the literature on replication and cross-validation research has revealed that psychologists have tended to ignore replication research. A review of the functions of and deterrents to replication studies is presented. Consideration of the factors influencing replication research suggests that the experimental method, as adopted from physics and chemistry, is invalid for investigating human behavior (31 ref.)—*Author abstract.*

1467. Verplanck, William S. (U. Tennessee) **An "overstatement" on psychological research: What is a dissertation?** *Psychological Record*, 1970(Win), Vol. 20(1), 119-122.—Supports psychological research that is primarily descriptive ethological rather than experimental, in the sense in which this word has been used in psychology. The physical-science model to which psychology has tailored itself has not proven a productive one.—*Journal abstract.*

1468. von Hattingberg, Immo. (Leutoburger Wald Sanatorium, Bad Rothenfelde, W. Germany) **Grundfragen und Methoden der Angstforschung.** [Fundamental problems and methods of research on anxiety.] *Psychologische Beiträge*, 1969, Vol. 11(3), 305-322.—Discusses difficulties in differentiating between fear and anxiety. Describes 3 possible methods of conducting investigations concerning anxiety in humans: (a) independent observation of behavior (Freud), (b) self-knowledge (Kierkegaard and Sartre), and (c) physiological and anatomical investigations. Problems which result from the use of each method are discussed (French & English summaries) (31 ref.) B. A. Stanton.

MODELS & MATHEMATICAL MODELS

1469. Ardila, Ruben. (National U., Bogotá, Colombia) **Mathematical learning theories.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 189-204.—Reviews current research on mathematical psychology in the field of learning. Mathematical learning theory is defined and some history of mathematical models is given. Estes' stimulus sampling theory is analyzed in detail, and a critical evaluation is attempted. (42 ref.)—*R. D. Nance.*

1470. Attinger, Ernst O. & Millendorfer, Hans. (U. Virginia) **Performance control of biological and societal systems.** *Perspectives in Biology & Medicine*, 1968(1st), Vol. 12(1), 103-123.—Using a general systems approach attempted "to enlarge the narrow framework within which specialists usually consider biological and

societal systems. By emphasizing both the similarities in their organization and the need for multidisciplinary approaches for their analysis, it leads to the development of cybernetic models for the study of the behavior of complex systems and of the interaction between component systems. By means of a parametric performance analysis, the effects of changes in various system parameters may be analyzed when the system is subjected to stress. From such an analysis one obtains a ranking of parameters, subsystems, and interphases with respect to performance which, in turn, will indicate the nature of possible control mechanisms and their standing within the hierarchy of control systems. The general approach is illustrated by 2 examples at the organismic and societal level. (19 ref.)—*J. Crabbe*.

1471. **Bredenkamp, Jürgen.** (47-51 Hauptstr., Heidelberg, W. Germany) **Über die Anwendung von Signifikanztests bei theorie-testenden Experimenten.** [The application of significance tests in theory-testing experiments.] *Psychologische Beiträge*, 1969, Vol. 11(3), 275-285. —Emphasizes the need for knowledge of the probabilities of both statistical errors in multiple-hypothesis theory-testing. Mathematical models are presented to illustrate the application of 3 types of significance tests to theory-testing experiments. (French & English summaries)—*B. A. Stanton*

1472. **Graen, George; Alvares, Kenneth; Orris, James B., & Martella, Joseph A.** (U. Illinois) **Contingency model of leadership effectiveness: Antecedent and evidential results.** *Psychological Bulletin*, 1970(Oct), Vol. 74(4), 285-296. —Analyzes the contingency model of leadership effectiveness and its supporting research from strategical and procedural perspectives. Numerous potential and realized problems are discussed. It is concluded that although the antecedent probability based upon previously published reports appeared to be greater than 0, the evidential probability based upon the evidence reviewed herein approaches 0. Thus, the resulting inverse probability casts grave doubt on the plausibility of the contingency model. (29 ref.)—*Journal abstract*.

1473. **Miehle, William & Siegel, Arthur I.** (Applied Psychological Services, Science Center, Wayne, Pa.) **Defect signal detection model based on variable confidence.** *Human Factors*, 1970(Aug), Vol. 12(4), 409-420. —Assumes a person has varying levels of confidence that a defect or a target exists. He will say that a defect or target exists when his confidence is equal to or exceeds a criterion level. For a single criterion level, he will say that no target or defect exists when his confidence is below criterion level. For a double criterion level, he will say no when his confidence is below a lower value than criterion level. Otherwise, he will try again. When a defect exists, the confidence frequency function increases with increasing confidence. When no defect is present, a different (decreasing) function describes the behavior. Confidence varies between 0 and 1. For a given frequency function, reliability is calculated as a function of the relative number of defects and the criterion level. The optimum criterion level and maximum reliability are found. Operating characteristic curves are presented. For a single criterion level, results are given for the following types of frequency functions: linear, exponential, normal, step, and arbitrary. Discrete distributions are also considered. An example for a double criterion level is also presented.—*Journal abstract*.

MATHEMATICS & STATISTICS

1474. **Bentler, P. M.** (U. California, Los Angeles) **A comparison of monotonicity analysis with factor analysis.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 241-250. —Describes a technique for determining latent sources of monotonic covariation among the n variables of an N by n data matrix. The data matrix is mapped into a square symmetric n by n matrix of monotonicity coefficients, summarizing the monotonic relationships among the variables. A roots and vectors representation of the derived matrix then maps the variables into a Euclidean space. The metric of the columns of the data matrix can be ignored to yield a final result which is invariant with respect to any monotonic transformations of the variables' scales. Artificial data are used to illustrate how this procedure recovers multidimensional Guttman scales, and how it compares to factor analysis.—*Journal summary*.

1475. **Edgington, Eugene S.** (U. Calgary, Alberta, Canada) **Hypothesis testing without fixed levels of significance.** *Journal of Psychology*, 1970(Sept), Vol. 76(1), 109-115. —Hypothesis testing without fixed levels of significance is common practice in psychology, although almost all psychological statistics books require the researcher to set a level of significance in advance. The reason for this requirement and its irrelevance to the use of hypothesis testing for providing a measure of the evidence against the null hypothesis are discussed. The interpretation of probability values in the absence of fixed levels of significance is considered, and it is recommended that students be taught statistics from the standpoint of the use of exact probabilities as measures of evidence against the null hypothesis.—*Journal summary*.

1476. **Hofstee, W. K.** **De betrouwbaarheid van slaag-zak-beslissingen.** [The reliability of pass-fail decisions.] *Nederlandsche Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jun), Vol. 25(6), 380-383. —The reliability of a testing-instrument is less important than the reliability of the decisions, particularly in binary-test situations. The quality of a test must be considered in terms of the number of erroneously-made correct and incorrect answers. Frequently the reliability based on the scores of the entire range of a test may render a false impression about the decisions made by the Ss. An internal "phi-consistency" coefficient determining the reliability of the decisions is presented. The formula includes the correction provided by the Spearman-Brown formula.—*A. J. Ter Keurst*.

1477. **Hope, K.** (Edinburgh U., Scotland) **The complete analysis of a data matrix: Application and interpretation.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 657-666. —Discusses the various practical problems which arise when K. Hope's method of Complete Analysis is applied to an entity by variable matrix. Underlying assumptions are that (a) correlation coefficients or cosines are adequate measures of association between dimensions, and (b) distance is an adequate measure of similarity between entities or groups.—*R. L. Sulzer*.

1478. **Howard, Kenneth I. & Krause, Merton S.** (Northwestern U.) **Some comments on "Techniques for estimating the source and direction of influence in panel data."** *Psychological Bulletin*, 1970(Sep), Vol. 74(3), 219-224. —Further techniques for the determination and description of causal influence in nonex-

perimental data were recently introduced by A. H. Yee and N. L. Gage (see PA, Vol. 42:14714). These methods, however, do not rest on an adequate formulation of causal logic. Some elements of such a formulation are presented, and their application to the procedures outlined by Yee and Gage are indicated. Attention is given to the selection of rival hypotheses, the assumptions underlying the several analytic techniques, and the function of plausibility and prior substantive commitment in the analysis of nonexperimental research.—*Journal abstract.*

1479. Isaac, Paul D. (Ohio State U.) **Linear regression, structural relations, and measurement error.** *Psychological Bulletin*, 1970(Sep), Vol. 74(3), 213-218.—Distinguishes between situations to which linear regression analysis is applicable and situations which involve linear structural relations. Although both situations involve estimates of linear parameters, the parameters serve a different purpose in the 2 situations, and, consequently, their estimates in general will differ. The assumptions and predictive nature of regression are reviewed and contrasted with the assumptions and nature of linear structural relations. In the structural relation, there is no question about 2 regression lines; only 1 line is of interest. The implications of measurement errors for the 2 situations are pointed out. An example is given in which linear regression analysis was used inappropriately, and in which the analysis for a linear structural relation would have been appropriate.—*Journal abstract.*

1480. Knepp, Dennis L. & Entwisle, Doris R. (Johns Hopkins U.) **Testing significance of differences between two chi-squares.** *Psychometrika*, 1969(Sep), Vol. 34(3), 331-333.—Presents a test for the difference between 2 χ^2 's requiring evaluation of the difference with respect to the $T(x)$ Bessel function. Included is a table of the 5 and 1% points for the Bessel function with degrees of freedom up to 100.—*Journal abstract.*

1481. Lord, Frederic M. (Educational Testing Service, Princeton, N.J.) **Estimating true-score distributions in psychological testing: An empirical Bayes estimation problem.** *Psychometrika*, 1969(Sep), Vol. 34(3), 259-299.—Considers the problem: Given that the frequency distribution of the errors of measurement is known, determine or estimate the distribution of true scores from the distribution of observed scores for a group of examinees. Typically this problem does not have a unique solution. However, if the true-score distribution is "smooth," then any 2 smooth solutions to the problem will differ little from each other. Methods for finding smooth solutions were developed (a) for a population, and (b) for a sample of examinees. (26 ref.)—*Journal abstract.*

1482. May, Richard B. & Konkin, Patrick R. A **nonparametric test of an ordered hypothesis for k independent samples.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 251-257.—If a researcher hypothesizes a complete ordering of k groups, he may study the significance of the trend by a simplification of Jonckheere's test. This test is based on Kendall's S statistic. Tables are presented for $n = 2-30$ and for $k = 3-10$. Also presented are 4 alpha levels.—*N. M. Chansky.*

1483. Murrell, J. F. (Inst. of Aviation Medicine, Farnborough, England) **Multidimensional scaling of an aircraft handling rating scale.** *Ergonomics*, 1969(Nov), Vol. 12(6), 925-933.—Submitted the items of

the Cooper Aircraft Handling Rating scale to 12 qualified test pilots who judged how far apart the items should be on the scale. The resulting single dimension scaling of the items does not give an equal-interval scale. Analysis of the responses by Ss indicates that problems arise in comparing ratings given by different users of the scale. Action to modify the scale is suggested but this is not proposed as a complete resolution of the problems raised. (German & French summaries)—*Journal abstract.*

1484. Oaten, Allan. (Michigan State U.) **Approximation to Bayes risk in compound decision problems.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5745.

1485. Perlson, Michael R. (Purdue U.) **Factorial dimensionality and subgrouping as a basis for modification of prediction.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5730-5731.

1486. Schönplüg, Wolfgang. (Ruhr U., Psychologische Inst., Bochum/Querenburg, W. Germany) **Psychische Vorgänge beim psychologischen Skalieren: I. Urteilstendenzen bei der Benutzung von Skalen mit sieben Stufen.** [Psychic processes in psychological scaling: I. Judgment tendencies in the use of scales with 7 grades.] *Psychologische Beiträge*, 1969, Vol. 11(3), 286-293.—80 undergraduates graded 2 lists of randomly selected word pair concepts on a 7-grade impression differential scale. Intraindividual correlations were determined for the frequency with which each S chose each of the 7 grades. Results are factor analyzed and show 2 main factors: (a) an accentuation factor, and (b) a differentiation factor. A trend appeared in that Ss had a propensity to choose grades at the middle of the scale. (French & English summaries)—*B. A. Stanton.*

1487. Schönplüg, Wolfgang. (Ruhr U., Psychologische Inst., Bochum/Querenburg, W. Germany) **Psychische Vorgänge beim psychologischen Skalieren: II. Urteilstendenzen bei der Benutzung von Skalen mit drei und elf Stufen.** [Psychic processes in psychological scaling: II. Judgment tendencies in using scales that have three and eleven grades.] *Psychologische Beiträge*, 1969, Vol. 11(3), 295-304.—63 undergraduates rated 15 polar adjective pairs from a list developed by Ertel. Ss were given an impression differential scale with 3 grades, and 80 Ss were given a scale with 11 grades. Grade choice frequency was assessed and factor analyzed. Results of the 3-grade scale show that Factor 1 demonstrated alternation between choice of a central grade and a marginal grade, while Factor 2 showed a preference for marginal grades. Results of choices with the 11-grade scale showed accentuation and differentiation factors and a preference for central grades. (French & English summaries)—*B. A. Stanton.*

1488. Werts, Charles E. & Linn, Robert L. (Educational Testing Service, Developmental Research Div., Princeton, N.J.) **Path analysis: Psychological examples.** *Psychological Bulletin*, 1970(Sep), Vol. 74(3), 193-212.—Demonstrates the usefulness of path analysis by applying it to a set of kindred problems: (a) the correlation of true scores over time, allowing specified measurement errors to be correlated; (b) the "bouncing beta" in stepwise regression analysis; (c) the specification of the number and interrelationships of latent variables in a set of data; (d) adjustments for covariate unreliability in the analysis of covariance; and (e) the analysis of multitrait-multimethod matrices. (16 ref.)—*Journal abstract.*

1489. Wolfe, John H. (U.S. Naval Personnel &

Training Research Lab., San Diego, Calif.) **Pattern clustering by multivariate mixture analysis.** *Multivariate Behavioral Research*, 1970(Jul), Vol. 5(3), 329-350.—Reformulated cluster analysis as a problem of estimating the parameters of a mixture of multivariate distributions. The maximum-likelihood theory and numerical solution techniques are developed for a fairly general class of distributions. The theory is applied to mixtures of multivariate normals and mixtures of multivariate Bernoulli distributions. The feasibility of the procedures is demonstrated by 2 examples of computer solutions for normal mixture models of the Fisher Iris data and of artificially generated clusters with unequal covariance matrices. (24 ref.)—*Journal abstract.*

1490. Zimmerman, Donald W. (Carleton U., Ottawa, Ontario, Canada) **Variability of test scores and the split-half coefficient.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 20(2), 259-266.—Demonstrates that the correlation between half test scores over repeated random test splits, across persons, and across occasions is given by Kuder-Richardson (KR) Formula 21. The condition under which KR 21 equals test reliability is given.—*N. M. Chansky.*

Factor Analysis

1491. Hofstee, W. K. **Factoranalyse over on-bepaalde aantallen variabelen.** [Factor-analysis about unlimited number of variables.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jun), Vol. 25(6), 377-379.—Describes an ALGOL program developed for component analysis of matrices in which the number of variables is large and the number of entities limited. The upper-limit of the number of entries over the number of factors depends on the "memory-size" of the computer. The factors to be extracted from the data should not exceed the number of persons or entries.—*A. J. Ter Keurst.*

COMPUTERS & PROGRAMING

1492. Alekseev, S. G. & Volkov, A. F. **Nekotorye voprosy obrabotki graficheskoi informatsii s ispol'zovaniem poluavtomaticheskikh ustroystv schityvaniya.** [Some questions on the treatment of graphic information with utilization of semiautomatic computer equipment.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 185-187.—Examines a device for the treatment of telemetric information—1 which projects the telemetric information onto a screen from a 35-mm film and supplies solutions to problems involving the transformation and ascertainment of the coordinates of any point of the graph.—*I. D. London.*

1493. Glushkov, N. N., L'vov, V. A., & Storozhuk, V. M. **Preobrazovatel' vremennyykh sootnoshenii impul'snoi aktivnosti neuronov v tsifrovuyu formu dlya vvoda v pamyat' EVM.** [A transformer of time relations of neuronal impulse activity into digital form for lead into the memory of the electronic computer.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 212-216.—Describes a device which facilitates the introduction into the computer memory of information on neuronal impulse activity from (a) the output of a biopotential-amplifier directly during the experiment, or (b) a magnetograph with recording in analog form.

Results of experiments issuing from the determination of interimpulse intervals of neurons in the somatosensory cortex against background rhythm and during strychnine poisoning are presented.—*I. D. London.*

1494. Ivannikov, Yu. G. **Primenenie EVM dlya stereotaksicheskikh raschetov.** [Application of the electronic computer for stereotaxic calculations.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 233-235.—Describes a method based on the computer transformation of coordinates after preliminary correction of distortions in the X-ray picture, utilized for calculation of stereotaxic coordinates.—*I. D. London.*

1495. Shure, Gerald H. & Meeker, Robert J. (System Development Corp., Santa Monica, Calif.) **A computer-based experimental laboratory.** *American Psychologist*, 1970(Oct), Vol. 25(10), 962-969.—Describes a computer-based laboratory, developed and applied in behavioral research over a 6-yr period. The laboratory design is described in terms of general capabilities, physical configuration, 2 computer systems (dedicated and time-sharing), and associated equipment. Descriptions are given of computer-managed experiments to illustrate computer advantages: (a) rapid preexperimental assessments of Ss; (b) presentation of instructions, and generation of stimuli and their controlled presentation; (c) improved methodology in executing experimental conditions; (d) recording of computer-mediated social interaction; and (e) control of social interaction (simulated Ss programmed to incorporate complex contingencies). Novel methodological capabilities include: on-line interviewing during the experiment, in-process assistance for Ss, implementing complex communication networks (to alter communications, to randomize interaction of Ss, or to implement alterable hierarchical relationships), and real-time data analysis (providing E with in-process results and analyses as bases for possible on-line intervention). The problems of bringing this technology to a wider community of behavioral scientists are discussed, particularly that of getting the investigator into a context governed by unfamiliar procedures. (29 ref.)—*Author abstract.*

1496. Stukovská, Magda. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Efektivnost stol'nykh počítačov v základnom výskume.** [Effectiveness of table-computers in basic research.] *Studia Psychologica*, 1970, Vol. 12(1), 78-80.

1497. Tonkonogii, I. M. (Bekhterev Research Psychoneurological Inst., Leningrad, USSR) **O primenenií ideí i metodov kibernetiki v neiropsikhologicheskikh issledovaniyakh.** [On application of the ideas and methods of cybernetics in neuropsychological research.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(1), 49-53.—Based on a wide range of data, discusses the recognition of images, in order to explore, for example, the findings and prospects of neuropsychological research, based on the conceptions and methods of cybernetics and on its newly developing branch, bionics.—*I. D. London.*

TESTING

1498. Crombag, H. F. (Rijksuniversiteit, Leiden, Netherlands) **Vergelijking van een examen met open vragen en een meerkeuze-toets.** [Comparison between an open question examination and a multiple-

choice test.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jun), Vol. 25(6), 349-359. —Investigated to what extent a traditional criminal law examination with open end questions measured the same thing as an achievement test with multiple choice questions. Ss were 315 law students. Each test item measured a corresponding bit of information. Each test consisted of 20 questions. The r between open-end and multiple choice was +.66 and +.94 after correction for attenuation. The internal reliability was .62 and .80, respectively. The factor analysis of the results indicated that Factor I consisted of knowledge of criminal justice and Factor II indicated that a certain test item was not pertinent. Further factor analysis indicated a bipolarity of factors that suggest that they do not measure anything that can be ascribed to the specific form of the tests. It is concluded that both tests measure the same factors equally well. In general, a multiple-choice test should contain more items to assure the equal reliability with the open-end test.—A. J. Ter Keurst.

1499. de Groot, A. D. (U. Amsterdam, Netherlands) **Some badly needed non-statistical concepts in applied psychometrics.** *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jun), Vol. 25(6), 360-376. —Discusses the social implications of a testing program. Acceptability is the "4th" dimension added to the dimensions of reliability, validity, and profitability. The aspects of acceptability are objectivity, transparency, and justifiability of differential decisions. Complete objectivity of a test is attained when all the pertinent data of a subject up to the final decision can be administered by a machine. Transparency of a test requires that a testee has available all the information he needs about the test itself so that his best possible performance can be developed. The justifiability of differential decision depends on the testee's acceptance of the test as being representative of the material being tested, equitable in its aim of being valid in composition and having a high predictive-validity. Analysis of acceptability requires a nonstatistical reasoning borrowed from legal disciplines rather than from scientific methodology. (22 ref.)—A. J. Ter Keurst.

1500. Franke, Joachim. (U. Erlangen-Nürnberg, Inst. für Wirtschafts- und Sozialpsychologie, W. Germany) **Eine Konzeption zum systematischen Aufbau Eignungsuntersuchungen.** [A concept for the systematic organization of aptitude testing.] *Psychologische Beiträge*, 1969, Vol. 11(3), 390-405. —Describes a concept which serves as a guide and memory-aid in the planning of aptitude testing to enable the practical psychologist to recognize quickly which partial tasks in the course of data selection, data gathering, and data processing have not yet been solved. The visualization, facilitated by the demonstrative pattern, of the optimum condition of the aptitude testing procedure is intended to simplify the decision as to where an improvement of the mode of procedure can most easily be realized. Replacement of aspects of personality theory by theoretical role aspects in aptitude testing is suggested. (French summary) (20 ref.)—English summary.

1501. Hicks, Lou E. **Some properties of ipsative, normative, and forced-choice normative measures.** *Psychological Bulletin*, 1970(Sep), Vol. 74(3), 167-184. —Evaluates and summarizes the relevant literature describing mathematical and empirical properties of ipsative and nonipsative measures. The need for a simple procedure for quantifying the "degree of ipsativity" in

measuring instruments is indicated. It is concluded that although nonipsative (normative or forced-choice normative) measuring instruments can be highly effective in most assessment situations, purely ipsative instruments possess such extensive psychometric limitations that use of such instruments is not recommended. (2 p. ref.)—Journal abstract.

1502. Shoemaker, David M. & Osburn, H. G. (Oklahoma State U.) **A simulation model for achievement testing.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 267-272. —Computer simulation of achievement testing requires 3 features be present: items, Ss, and S passing or failing of items. Test content "is simulated by fixing the tetrachoric correlations among the items." S ability level is defined as relative to his reference group and is therefore represented by a Z score. Passing or failing an item is determined in the following manner: (a) the probability of passing an item is found, (b) a number between 0 and 1 is randomly selected from a rectangular distribution, and (c) if a is greater than b, the item is passed. An application is presented.—N. M. Chansky.

1503. van der Ven, A. H. (Catholic U., Nijmegen, Netherlands) **Het aantal overgeslagen items als testscore in tests met tijdlimiet.** [The sum of omitted items as a test-score in time-limited tests.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jun), Vol. 25(6), 418-428. —3 "error-models" are indicated: the Poisson-error, the binomial-error, and the generalized binomial-error models. The assumption was made that the score of omitted items follows for a testee a Poisson distribution model. The Interest, School-Progress and Intelligence (ISI), a time-limit test of intelligence, was administered to 2000 5th and 6th grade Ss. In 3 of the 6 subtests of the ISI, the Poisson model was rejected. Reliability r_s , ranging from .40-.70, for the number of test items omitted were calculated for each of the subtests. It is concluded that the number of test items omitted as a test score has a low reliability.—English summary.

Construction & Validation

1504. Dicks, Paul. **Elaboration d'un test de vocabulaire allemand (WST 41).** [Construction of a German vocabulary test (WSI 41).] *Information Psychologique*, 1969(Jan), No. 33, 3-22. —An existing German vocabulary test was modified, and administered to 829 recruits classified on the basis of their education into 6 groups. The new test called WST 41 correlated .57 with the Domino 48 test and .60 with the Progressive Matrices. Norms are provided for students of different levels of education. (16 ref.)—S. G. Vandenberg.

1505. Droege, Robert C., Showler, William; Bemis, Stephen, & Hawk, John. (U.S. Dept. of Labor, Manpower Administration, Washington, D.C.) **Development of a nonreading edition of the General Aptitude Test Battery.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(1), 45-53. —To provide a basis for comprehensive aptitude measurement of the disadvantaged, a non-reading edition of the General Aptitude Test Battery (GATB) was developed. The follow-up experiment analyzed the interrelationships of the experimental nonreading test and the GATB for a sample of high school seniors. Results indicate that composites of the nonreading test could be developed that had relatively high correlations with GATB aptitudes. The 1 exception

was the inability to develop a nonreading counterpart of the GATB measure of clerical perception. This investigation was followed by research to standardize the nonreading aptitude tests on disadvantaged individuals.—S. M. Amatora.

1506. Kuder, Frederic. **Some principles of interest measurement.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 205-226.—12 principles are offered as guides to the development of vocational interest inventories: (a) capacity to distinguish between occupational groups, (b) adequate sampling of interests within a vocational domain, (c) invariance of item form, (d) freedom of item form from response bias, (e) avoidance of job titles in interest items, (f) presence of internal validity checks, (g) equipotentiality of use with males and females, (h) score stability, and (i) reporting of scores in order of magnitude of interests. (21 ref.)—N. M. Chansky.

1507. van Naerssen, R. F. **Tweekeuze-items in studietoetsen.** [Two-choice items in study-tests.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jun), Vol. 25(6), 393-403.—Discusses the advantages of the 2-choice multiple-choice (MC) and true false (TF) tests. MC tests are frequently less ambiguous than the TF, can avoid the frequent non-discriminatory answers of the 4-point MC, and may take less time to construct than the 4-point MC. The problem is whether splitting a 4-choice MC into 2 2-choice MC will affect the reliability. Ss were 92 secondary-school pupils who responded on a 50-item 4-choice MC and on a 2-choice 100-item MC. The tests were parallel. The r of the item-test was higher for the 2-choice than for the 4-choice but the difference was not significant. When the intercorrelations between less difficult tests are very high, the 4-choice is more reliable than the 2-choice test of double length.—A. J. Ter Keurst.

EXPERIMENTATION & OBSERVATION

1508. Fisch, Rudolf. (U. Saarbrücken, Psychological Inst., W. Germany) **Hinweise für den Bau eines elektrophysiologischen Mehrzwecklabors.** [Suggestions for the construction of an electrophysiological multiple purpose laboratory.] *Psychologische Rundschau*, 1970(Jul), Vol. 21(3), 180-186.—Insulation against acoustical noise and stray potentials were the chief demands for the laboratory. In addition communication between S and E from the control room containing the electronic measurement equipment was necessary. Optimal arrangements of the rooms, shielding against noise, air-conditioning, 1-way mirror screening, and projection openings are discussed.—W. J. Koppitz.

1509. Hutt, S. J. & Hutt, Corinne. (Park Hosp. for Children, Human Development Research Unit, Oxford, England) **Direct observation and measurement of behavior.** Springfield, Ill.: Charles C Thomas, 1970. xii, 224 p. \$14.95.

1510. Levine, Anson J. (U. Houston) **An evaluation of functional ecological psychology.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5715-5716.

1511. Stoyva, Johann M. (U. Colorado, Medical School, Denver) **The public (scientific) study of private events.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 355-368.

APPARATUS

1512. Abdrakhmanov, M. I., Stakhov, A. A., & Shapiro, M. G. **Magnitomekhanicheskie gazoanalizatory kisloroda tipa MMG.** [MMG-type magnetomechanical gas analyzer of oxygen.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 139-141.—Describes the principle of action, basic features, and advantages of instruments which are most promising for the automatic analysis and regulation of oxygen content in complex mixtures of gases.—I. D. London.

1513. Aleev, L. S. & Bunimovich, S. G. **Upravlenie dvizheniyami cheloveka s pomoshch'yu mnogokanal'nogo elektronnoho ustroystva.** [Controlling human movements with the aid of multichannel electronic equipment.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 216-222.—The neuromuscular apparatus is excited in normal and pathological conditions by electrical impulses, amplitudemodulated by the averaged value of EMGs picked up from similarly situated body "motor points." The device makes it possible to control the movements of 1 person by picking up signals from another.—I. D. London.

1514. Alyamovskaya, V. A., Dubrovskii, N. A., Krylov, L. M., & Sosnina, O. V. **Generatory periodicheskikh signalov dlya biofizicheskikh izmerenii.** [Generators of periodic signals for biophysical measurements.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 152-155.—Examines the circuits for 2 generators of periodic signals widely applicable in varied psychophysical and electrophysiological measurements: (a) a generator of calibrated right-angular impulses, and (b) a generator of sawtooth voltage.—I. D. London.

1515. Arnaumov, A. L. **Printsipy konstruirovaniya mnogokanal'nykh reografrov.** [Principles underlying the construction of multichannel rheographs.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 65-66.—Analyzes (a) the possibilities of constructing multichannel rheographic systems for physiological research, and (b) the rationale for the choice of optimal interelectrode distances and the choice of frequencies of alternating current and its voltages.—I. D. London.

1516. Beach, Garnet. (Rockefeller U.) **A sensitive activity transducer.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 237-239.—Describes a highly flexible inexpensive apparatus designed to record the movements of laboratory animals. The magnitude of even very small movements (e.g., sniffing and quivering movements of a rat following injection of a CNS stimulant) can be reflected in a polygraph record. Diagrams for electrical circuit and transducer tube are provided.—P. McMillan.

1517. Bokser, O. Ya. & Klevtsev, M. I. **Analiz tochnosti i razreshayushchei sposobnosti reflektometrov.** [Analysis of the accuracy and resolving power of reflexometers.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 142-144.—Analyzes the error components of electromechanical and electronic reflexometers employed in research on CR activity and stimulation.—I. D. London.

1518. Bol'shov, V. M. & Smirnov, V. I. **Trékh-**

kanal'nyĭ reopletizmograf. [Three-channel rheoplethysmograph.] In V. V. Parin (Ed.), *Sovremennyye pribory i tekhnika fiziologicheskogo ėksperimenta*. (See PA, Vol. 45:Issue 2) 69-73.—Describes a 3-channel electronic apparatus, 2 channels of which are rheoplethysmographic. The 1st 2 channels allow recording of impedance changes in live tissue with frequencies of 0-120 cps. The 3rd channel records EKG characteristics.—I. D. London.

1519. Buckalew, L. W. & Cartwright, G. M. (Georgia Southern Coll.) **The contiguity platform: A high response manipulandum.** *Psychological Record*, 1970(Spring), Vol. 20(2), 247-250.—Describes a platform replacement of the standard bar of the Skinner box. Features of this modification include high response-reinforcement contiguity, fast acquisition, high response rate, and minimal E involvement. Platform data reveal good illustrations of standard learning phenomena associated with the bar. Use of the contiguity platform is suggested as appropriate and advantageous for animal drug studies and classroom illustrations of conditioning phenomena.—*Journal abstract*.

1520. Dadashev, R. S. **Printsipy postroeniya mashin dlya kontrolya i diagnoza sostoyaniya organizma.** [Principles of instrument construction for the inspection and diagnosis of the state of the organism.] In V. V. Parin (Ed.), *Sovremennyye pribory i tekhnika fiziologicheskogo ėksperimenta*. (See PA, Vol. 45:Issue 2) 188-204.—Presents a mathematical analysis of the stages and principles of such construction, including (a) the gathering of physiological data, (b) the analysis and treatment of primary signals, (c) algorithmization of the results of analysis, and (d) the construction of apparatus for the inspection and diagnosis of organismic states.—I. D. London.

1521. Dalton, Leslie W., Henton, Wenden W., Taylor, Henry L., & Allen, James N. **A closed system audio helmet for monkeys.** *USAF ARL Technical Report*, 1969(Dec), No. 69-17, 3 p.—Describes a closed system audio helmet for monkeys which is both reliable and inexpensive. The need for head restraint is eliminated and also permits self-feeding. No problem was experienced in the daily fitting of the helmet; the operation required less than 5 min.—*Journal abstract*.

1522. Davis, Stanley D. (Case Western Reserve U., Engineering Design Center) **A continuous activity monitor for small caged animals.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 953-954.—Describes a simple system for continuously monitoring activity of small caged animals. The system, comprising a piezo-electric transducer, diode rectifier and low-pass filter, can be used with any appropriate recording DC voltmeter and is suitable for long-term application.—*Journal abstract*.

1523. Dubrovskii, N. A., Korabchevskaya, A. V., & Sosnina, O. V. **Elektronnyi klyuch dlya bioakusticheskikh izmerenii s malymi perekhodnymi protsessami.** [Electronic key for bioacoustic measurements with small transitory processes.] In V. V. Parin (Ed.), *Sovremennyye pribory i tekhnika fiziologicheskogo ėksperimenta*. (See PA, Vol. 45:Issue 2) 156-158.—Examines the basic circuit of an electronic multivibrator key for different kinds of bioacoustic research. The circuit allows the procurement of carrier impulses with temporally regulated step-up and down.—I. D. London.

1524. Falaleev, A. G. **Sinkhronnaya registratsiya**

ryada fiziologicheskikh protsessov vo vremya vypolneniya modelirovannykh sorevnovatel'nykh nagruzok. [Synchronous registration of a number of physiological processes during simulated competitive muscular activity.] In V. V. Parin (Ed.), *Sovremennyye pribory i tekhnika fiziologicheskogo ėksperimenta*. (See PA, Vol. 45:Issue 2) 272-273.—Describes equipment which, as it synchronously records EEGs, EKGs, EMGs, respiration, etc., makes it possible during the process to (a) "perform muscular work and program direction or distance," (b) voluntarily regulate physical exertion, (c) perform movements simulating the basic motor skills of athletes, and (d) calculate the absolute mechanical power developed by the athlete.—I. D. London.

1525. Golubtsov, K. V. & Volodin, B. I. **Pre-dvaritel'nyĭ usilitel' postoyannogo toka k ostillografu tipa S1-19 i S1-4 dlya registratsii biopotentsialov.** [A preamplifier of direct current to oscillographs of the S1-19 and S1-4 types for recording biopotentials.] In V. V. Parin (Ed.), *Sovremennyye pribory i tekhnika fiziologicheskogo ėksperimenta*. (See PA, Vol. 45:Issue 2) 104-105.—Describes a 3-cascade preamplifier of direct current with a coefficient of amplification in the order of 1000, especially prepared to function with the Soviet oscillographs S1-4 and S1-19, widely used in electrophysiological research.—I. D. London.

1526. Hudston, Ramulph & van Houten, Ronald. (Dalhousie U., Halifax, Nova Scotia, Canada) **A cartridge for running long variable-interval tapes.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 165-166.—Describes an inexpensive cartridge for tapes up to 10 m. long, which contains the tapes within an area of less than 1 sq. ft. Construction is not difficult, and requires only 2-3 hr. to build. The cartridge has operated reliably for 6 mo. of almost continuous use. Figures providing a photograph and diagram are included.—P. McMillan.

1527. Karpenko, A. E. & Lavitskii, V. D. **K voprosu o ratsional'noi klassifikatsii datchikov fiziologicheskoi informatsii.** [On the rational classification of devices presenting physiological information.] In V. V. Parin (Ed.), *Sovremennyye pribory i tekhnika fiziologicheskogo ėksperimenta*. (See PA, Vol. 45:Issue 2) 27-32.—Examines the state of affairs within and without the Soviet Union regarding instrumentation which presents various kinds of physiological information. The necessity of a systematic classification of such instrumentation is demonstrated and an example adduced.—I. D. London.

1528. Karpenko, A. E. & Razvin, M. A. **Opyt primeneniya mnogokanal'nogo magnitnogo registratora v usloviyakh kliniki i ėksperimental'noi laboratorii.** [An experiment in the application of a multichannel magnetic recorder under the conditions of the clinic and experimental laboratory.] In V. V. Parin (Ed.), *Sovremennyye pribory i tekhnika fiziologicheskogo ėksperimenta*. (See PA, Vol. 45:Issue 2) 173-177.—Examines the applicational features of magnetic tapes, and the major possibilities of their utilization in medicophysiological examinations; and analyzes examples of the utilization of an 8-channel magnetic recorder (type: KRM-01).—I. D. London.

1529. Klochkov, A. M., Elin, P. A., Serov, V. F., & Sergeeva, L. I. **Opyt primeneniya tekhnicheskoi magnitnozapisyvayushchei sistemy dlya registratsii fiziologicheskikh pokazatelei organizma lĕtchika.**

[An experiment in the application of a technical magnetorecording system for registration of physiological indices of the aviator's organism.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 164-170.—Presents the experimental results of such registration of physiological indices (EEG, EMG, EKG, GSR, respiration, body temperature) in flight, and analyzes and prescribes their subsequent treatment by computer.—I. D. London.

1530. Levshankov, A. I., Markelov, I. M., Rafal'son, A. E., & Slutskii, M. E. Radiochastotnyi mass-spektrometr dlya izucheniya funktsii vneshnego dykhaniya. [Radiofrequency mass-spectrometer for studying the functions of external respiration.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 136-138.—Describes the principle of action, construction, and method of application of the apparatus, used to determine the composition of the air breathed.—I. D. London.

1531. Losev, I. I. Spetsial'nye usilitel'nye pribory dlya mikroelektroodnykh issledovaniy. [Special amplifying apparatus for microelectrode research.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 108-109.—Presents a description of the apparatus.—I. D. London.

1532. Losev, I. I., et al. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) Avtomaticheskaya kormushka dlya issledovaniya instrumental'nykh uslovykh refleksov u sobak. [Automatic food-trough for studying instrumental conditioned reflexes in dogs.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 181-183.—Presents details of the construction of an automatic feeder where only 1 cup of food is made accessible through lifting a lever by raising the forepaw and keeping it raised throughout the act of eating, thereby diminishing the factor of weight in certain experiments employing tensometric recordings. Thus, it is shown that disturbed motor reactions during eating in dogs with ablated motor cortex did not result from muscular weakness, but resulted from disturbed coordination of 2 motor reactions (eating and raising of forepaw).—I. D. London.

1533. Mangushev, R. G. & Yakhin, F. A. Transistoroe rele dlya vremennogo analiza refleksa. [Transistor relay for reflex time analysis.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 159-160.—Examines a semiconductive device, functioning with a commutator of voltage duration in studies of motor RT.—I. D. London.

1534. Millner, Edward C. (St. Elizabeth Hosp., National Center for the Prevention & Control of Alcoholism, Washington, D.C.) A simple mechanical uptake roller for cumulative recorder data. *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 199-200.—Describes a simple, inexpensive mechanical uptake roller which processes records in less than 10 min. that had previously required over 1 hr. The roller requires little maintenance and stores records in a roll labeled by date and session number. Construction time averages 4 hr. for 1 man, and approximate cost is \$6-\$10. A schematic diagram of a construction guide is provided.—P. McMillan.

1535. Mintsis, A. M. Pribor dlya mikroelektroodnykh

issledovaniy. [Apparatus for microelectrode research.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 236-237.—Describes apparatus intended for microelectrode research on the CNS of animals of moderate size in neurophysiological and electrophysiological studies. The electrodes can be introduced into strictly defined points of the brain and spinal cord.—I. D. London.

1536. Oppenheimer, Jess. (549 Moreno Ave., Los Angeles, Calif.) Orientation apparatus for human subjects. *Journal of Learning Disabilities*, 1968(Sep), Vol. 1(9), 507-515.—Describes various devices designed to help improve audio and visual perception. These devices, called visual, tactile, or audio "Concentrators," are of relatively simple construction and may be modified to deal with different types of perceptual problems.

1537. Parin, V. V. & Utyamyshev, R. I. Vvedenie. [Introduction.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 5-14.—Recounts the developments in the Soviet Union in the latter 1/2 of the 1960s leading to furtherance of new ideas in the design of technical apparatus in physiological research, and promotion of their manufacture and application.—I. D. London.

1538. Popov, I. I. Izmerenie bioelektricheskikh signalov na bortu letatel'nykh apparatov. [Measurement of bioelectric signals on board aircraft.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 101-103.—Examines a design for a portable transistor amplifier of biopotentials, and presents a theoretical analysis of the errors introduced through output of bioelectrical potentials from the body surface. A mathematical relationship is exhibited which shows the magnitude of relative error to be a function of the parameters of signal source and input resistance of the amplifier.—I. D. London.

1539. Prokudin, V. M. Rtutno-plastmassovyi tenzodatchik dlya fiziologicheskikh issledovaniy. [Mercurio-plastic device for conveying tensile information in physiological research.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 42-44.—Describes a simple method for preparing such a device.—I. D. London.

1540. Schastlivyi, O. Ya. & Prokudin, V. M. Primenenie otechestvennykh promyshlennyykh samopishushchikh priborov v fiziologicheskoy eksperimente. [Application of Soviet-manufactured self-recording devices in the physiological experiment.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 266-268.—Discusses several Soviet self-recording devices, especially those with built-in amplifiers, which can find wide application in physiological research.—I. D. London.

1541. Serov, N. P. Razdelitel'naya vysokochastotnaya pristavka k stimulyatoru s maloi emkost'yu vykhoda otnositel'no zemli. [Separative high-frequency reinforcer for a stimulator with small output volume relative to the earth.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 148-149.—Describes an instrument with small output resistance, developed to counter artifacts which emerge as the result of simultaneous stimulation

of the experimental object with electrical impulses and registration of biopotentials.—I. D. London.

1542. Shcherbakov, K. K. **Pribor dlya issledovaniya funktsii vneshnego dykhaniya cheloveka v usloviyakh pol'eta i v stendovykh eksperimentakh.** [Apparatus for studying the functions of human respiration under conditions of flight and in shooting experiments.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 132-136.—Describes a small economical piece of apparatus for studying the "complex of indices for human respiration." It consists of information-presenting devices and an electronic part, permitting a determination of the complex of spirometric and pneumotachometric indices of respiratory functions.—I. D. London.

1543. Silverman, R. W., Jenden, D. J., & Fairchild, M. D. (U. California, Medical School, Los Angeles) **A complete multiple unit counter with integrated output.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 949-952.—Describes a complete analyzer which measures and records variations of multiple unit activity. It can be directly connected to conventionally used electrodes and yields an output of 0-10 V depending on the frequency of multiple unit firings above an adjustable minimum threshold amplitude. The output can be integrated or averaged and processed by analyzing a potentiometric recorder chart output or by digital techniques.—*Journal abstract.*

1544. Tolkunov, B. F. **Opyt ispol'zovaniya amplitudnogo analizatora dlya issledovaniya vremennykh kharakteristik vyzvanoi i spontannoi aktivnosti neuronov golovnogogo mozga.** [An experiment in the utilization of an amplitude-analyzer to investigate the time characteristics of evoked and spontaneous activity of cerebral neurons.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 149-151.—Examines a circuit design utilizing an amplitude analyzer in neurophysiology. Basic to the apparatus is an amplitude analyzer (AI-100), and a specially constructed block, determining the program of analysis and transforming the temporal parameter into the amplitude parameter corresponding to it.—I. D. London.

1545. Utyamyshev, R. I. **Sovremennye printsipy konstruirovaniya fiziologicheskoi apparatury i nekotorye voprosy ee unifikatsii.** [Contemporary principles of the construction of physiological apparatus and some questions concerning its unification.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 15-26.—Examines the structural design of physiological apparatus, representing a constructional "synthesis of unified elements."—I. D. London.

1546. Utyamyshev, R. I., Neumyvakin, I. P., & Shovkoplyas, A. M. **Malogabaritnaya apparatura dlya izucheniya funktsii vneshnego dykhaniya.** [Small apparatus for studying the functions of external respiration.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 127-131.—Examines the principles of construction, design solutions, and technical characteristics of small apparatus for studying the respiratory functions. Such apparatus employs measuring devices of the wing and thermoanemometric types.—I. D. London.

1547. Utyamyshev, R. I., et al. **Malogabaritnaya apparatura dlya fiziologicheskikh issledovaniy.** [Min-

ature instrumentation for physiological research.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 85-100.—Presents a technical analysis of instrumentation consisting of devices for the presentation and initial transformation of physiological information for subsequent recording in analog form on a real timescale. The designs examined assume transistors, but several measuring channels contain "hybrid schemata" involving the use of electron tubes and elements of semiconductor technology.—I. D. London.

1548. Volkov, V. G. **Pribor dlya statisticheskogo analiza spaikovoï aktivnosti neuronov.** [Apparatus for statistical analysis of neuronal spike activity.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 144-147.—Describes the basic circuit and characteristics of a small transistor converter-reinforcer, intended for joint operation with a multichannel amplitude analyzer.—I. D. London.

1549. Yakovlev, V. V. **Rol' datchika-preobrazovatelya v fiziologicheskome eksperimente.** [The role of devices presenting and transforming information in the physiological experiment.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 33-36.—Examines the specifications guiding the construction and application of devices expected to yield reliable physiological data. Thorough testing of such instrumentation is advised.—I. D. London.

1550. Zaikin, M. G. **Trebovaniya, pred'yavlyayemye k istochnikam pitaniya tranzistornykh usilitelei biopotentsialov.** [Requirements demanded of power sources for transistor amplifiers of biopotentials.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 122-126.—Examines problems connected with the construction of semiconductive voltage stabilizers, intended to power transistor amplifiers of biopotentials. Analytic relationships of permissible voltage-pulsation for different biopotential amplifier cascades are deduced.—I. D. London.

1551. Zherbin, M. F. & Lazareva, A. M. **Tranzistornyi usilitel' dlya registratsii biotokov myshts.** [Transistor amplifier for recording muscle biocurrents.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 105-108.—Describes and analyzes a design for a portable transistor amplifier of biopotentials, distinguished for its high stability under change of external conditions. The amplifier can be utilized as a preamplifier for magnetophonic recording of biocurrents and in a telemetric system for the transmission of myograms.—I. D. London.

EXPERIMENTAL PSYCHOLOGY

1552. Ben Shakhar, Gerson; Lieblich, Israel, & Kugelmass, Sol. (Hebrew U., Jerusalem, Israel) **Guilty knowledge technique: Application of signal detection measures.** *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 409-413.—Applied procedures for the computation of optimal cutoff points suggested by signal detection theory to an information detection situation with 60 undergraduates. The use of different payoff matrices relevant to a security screening situation

and to a criminal court case produces different cutoff points to be used to classify the GSRs.—*Journal abstract.*

1553. Gumenik, William E. & Glass, Robert. (U. Toledo) **Effects of reducing the readability of the words in the Stroop Color-Word Test.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 247-248.—Decreasing the readability of words, by partially obscuring them with a mask, increased the susceptibility of reading and decreased the susceptibility of color naming to interference in the Stroop color-word conflict situation with 60 undergraduates. The conflict interfered with both reading and color-naming performance, with and without the mask, but the degree of interference was inversely related to the relative strength of the response.—*Journal abstract.*

1554. Khomeriki, T. L. (Burdenko Research Inst. of Neurosurgery, Moscow, USSR) **Latentnyi period migatel'nykh reflektov u cheloveka v otvet na raz-drazhenie glaz vozdukhnoi struei.** [Latent period of human wink reflexes in response to stimulation of the eye with an air-puff.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(2), 16-19.—18-40 yr. olds were Ss in this EMG study. Air puffs were used as stimulation for (a) both eyes simultaneously, (b) 1 eye, and (c) open and closed eyes. The value of the latent period of the wink reflex was not a function of position of the electrode leads (upper and lower lids, outer corner of the eye). With simultaneous stimulation of both eyes, the latent period on the left and right was the same. With stimulation of only 1 eye, the latent period was always shorter on the side of stimulation. With simultaneous stimulation of both eyes when closed, the latent period was shorter than was the case with stimulation of both eyes when open.—*I. D. London.*

1555. Kimble, Gregory A. & Perlmuter, Lawrence C. (U. Colorado) **The problem of volition.** *Psychological Review*, 1970(Sep), Vol. 77(5), 361-384.—The problem of volition is partly a verbal problem, as the extent to which it has been ignored by experimental psychologists seems to imply. However, the attributes of such behavior suggest a variety of empirical approaches, some of which are reviewed. 3 new experiments, designed to demonstrate certain of these properties, are presented. These experiments employ what is believed to be a simple example of the automatization of a voluntary act. Results suggest that this process involves a novel form of reinforcement and that automatic acts are relatively independent of their consequences and are inhibited by the process of paying attention to them. (68 ref.)—*Journal abstract.*

PERCEPTION

1556. Fine, Paul A. (Rutgers State U.) **Effect of language as an organizing factor in the perception of a clearly structured form.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5709.

1557. Hatfield, Jimmy L. & Soderquist, David R. (U.S. Army Medical Research Lab., Ft. Knox, Ky.) **Coupling effects and performance in vigilance tasks.** *Human Factors*, 1970(Aug), Vol. 12(4), 351-359.—Measured the performance of 32 male volunteers on 90-min auditory and visual vigilance tasks in conventional and theory of signal detection indices as a function of coupling, sense mode, and time on task. Order effects, correlations between sense modes, and possible effects of observing

responses were also examined. Regardless of the coupling condition or sense mode involved, β increased while hits and false alarms decreased as time on task increased. There was no significant decline in d' over time on task for either sense mode or coupling conditions. In general, conventional measures of performance were similar for the auditory and visual tasks. Significant cross-modality correlations were obtained for false alarms, latency, and β values. No order effects were observed. Results are discussed in terms of expectancy theory and an observing response model. (23 ref.)—*Journal abstract.*

1558. Kinney, Jo A. & Luria, S. M. (U.S. Naval Submarine Medical Center, Vision Branch, Groton, Conn.) **Conflicting visual and tactual-kinesthetic stimulation.** *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 189-192.—Investigated the relative importance placed on visual rather than tactual or kinesthetic cues under water. In matching disks of various sizes to common coins from memory, 20 Ss consistently chose disks much smaller than the actual size of the coins and more closely approximating their optical size in water, even when permitted to see their own hands. In Exp. II, the performance of a motor task, learned to criterion while blindfolded, was significantly more disrupted under water than in air when 5 Ss were permitted to look. Both sets of results demonstrate the dominance of vision over the other 2 senses. The importance of the under-water environment as a naturally distorted one, requiring no lenses or prisms to produce optical distortions, is emphasized.—*Journal abstract.*

1559. Melamed, Lawrence E. (Kent State U.) **The role of response processes in the formation of cross-modality assimilation effects.** *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 185-188.—Found the enhanced judgments of intensity of soft tones judged along with a series of bright lights (assimilation effect) to be dependent on the fact that the lights were judged coincidentally. Ss were 90 female undergraduates. This dependence was not observed in a parallel investigation of contrast effects in judgments of tones alone. Both the form of the assimilation effect and its specific dependence on judging both stimulus modalities argues against a sensory explanation. Instead, it is argued that this cross-modality assimilation effect represents a resolution of the specific difficulties involved in judging 2 qualitatively different modalities on 1 judgment scale.—*Journal abstract.*

1560. Weber, Robert J. & Castleman, Judy. (Oklahoma State U.) **The time it takes to imagine.** *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 165-168.—Conducted 3 experiments dealing with letter processing in visual and speech imagery. Exp. I and II, with 16 and 20 undergraduates serving as Ss, indicated that speech imagery is more rapid than visual imagery (about 6 letters/sec for speech vs. about 2 letters/sec for vision). Postexperimental scaling of subjective fatigue also revealed differences between imagery modalities, with visual imagery conditions consistently more fatiguing than speech conditions. Exp. III, with 5 undergraduates, dealt with error rates in learning to classify letters on the basis of visual image properties or arbitrary letter names. Results show much more efficient performance for classification based on visual image properties. It is concluded that visual and speech imagery modes differ fundamentally in the manner in which they process information.—*Journal abstract.*

Illusion

1561. Pearlstein, Richard C. (Washington U.) **Relationship of onset OR and terminal OR to the development of a concept of stimulus duration.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5721.

1562. Pressey, A. W. & Dewar, M. J. (U. Manitoba, Winnipeg, Canada) **A reversed Poggendorff illusion.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 227-228. —Modified the Poggendorff configuration so that the direction of illusion was reversed. The reversed illusion was found to be prevalent and reliable in a sample of 96 naive undergraduate Os. It was inversely correlated with the classical Poggendorff illusion. —*Journal abstract.*

1563. Somiya, Tamotsu. [Experimental examination of vibrating-method based on κ -sensitivity and its application and its application to geometrical illusions.] *Japanese Journal of Psychology*, 1969(Dec), Vol. 40(5), 255-266. —Based on experimental results of the on-off response of the human fovea, a hypothesis was proposed that light sensitivity possesses 2 aspects of τ and κ . 4 methods were devised to prove the hypothesis, and the present study is based on the 2nd method (i.e., when grating lines are vibrated in the face of a geometrical figure, they are distorted according to the characteristic of the figure). Experiments were conducted to test this procedure and to examine the relationship between the distortions of the grating lines and various geometrical illusions. (32 ref.) —*English abstract.*

Time

1564. Hawkes, Glenn R. & Worsham, Robert W. (Virginia Commonwealth U.) **Time perception for helicopter vibration and noise patterns.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 71-77. —Studied judgments of stimulus duration for noise and for vibration for stimuli ranging from .5-5 sec. 2 methods were used, production and reproduction, with either noise or quiet backgrounds. 8 male undergraduates served as Ss. No significant effects were found for kind of stimulation or for background condition. A consistent significant effect of method was reported, a finding interpreted as supporting the notion of a psychobiologic clock. Durations tended to be underestimated with the production method and overestimated with the reproduction method. The findings may be applicable to the task of the helicopter pilot or to others involving relatively intense stimulus environments. —*Journal summary.*

1565. Van Wulfften Palthe, P. M. **Time sense in isolation.** *Psychiatria, Neurologia, Neurochirurgia*, 1968(May), Vol. 71(3), 221-241. —Time sense is a function of upper brainstem paraconsciousness. Its estimation of time span is given intuitively without reasoning and moved by an inner certainty in the absence of nearly total external information. In 1-hr experiments of extreme isolation and solitary confinement, the estimates of 32 Ss oscillated steadily around 60% of real time. In cave experiments lasting several mo. and employing 65 Ss, the situation was less extreme, but the estimates by the alternating cortical and brainstem consciousness show an average of 60% of real time; however, the estimates of the time span after a sleep period differs considerably from those following a period of activity and with a lesser dispersion range. The terrestrial 24-hr rhythm is intrinsically present in the

estimates. Estimation falls considerably short of real time, hence duration seems unexpectedly long. —*Journal summary.*

1566. Vroom, P. A. (State U., Utrecht, Netherlands) **Effects of presented and processed information on duration experience.** *Acta Psychologica, Amsterdam*, 1970(Sep), Vol. 34(1), 115-121. —Studies on the relation between cognitive processes and time experience suggest that apparent duration increases with the transmission rate of information. Experiments support the proposition that estimated time lengthens with the sequence speed of stimuli presented during a given period. However, it appears that the way in which transmission is defined is of great importance for the nature of the effect. When the S has to behave actively, i.e., by translating the stimuli into binary choices, it is found that experienced duration decreases with the number of processed bits. It is demonstrated that these opposite effects are not in the 1st place due to the specific perceptual or physical properties of the tasks. —*Journal abstract.*

VISION

1567. Bartley, S. Howard & Ball, Richard J. (Michigan State U.) **Effects of intermittent photic input on brightness, hue, saturation, visual acuity, and stereopsis.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(May), Vol. 46(5), 315-318. —Reviews effects on sensory end result from using subfusional intermittent photic stimulation, particularly with part-spectrum inputs. These effects include brightness enhancement with inputs in the region of 500 m μ . In this region and, to a lesser extent in others, temporally induced desaturation may occur. Temporally induced hue changes are grouped around 2 neutral points. There is evidence for supersaturation in some regions of the spectrum. Visual acuity is impoverishable under the same manipulations that produce brightness enhancement but so far no marked effect on stereopsis has been demonstrable. (30 ref.) —*Journal abstract.*

1568. Fry, Glenn A. (Ohio State U., Coll. of Optometry) **Positive afterimage and measurements of light and dark adaptation.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Jun), Vol. 46(6), 397-409. —Proposes that the positive afterimage is generated by energy given off by a substance which accumulates during exposure of the retina to light and dwindles away when the eye is kept in darkness. An attempt is made to show how this proposal is related to such phenomena as the latent period, the rate of rise and fall, the negative phase, the flight of colors, neutralization, and the effect of the positive afterimage on the absolute threshold and binocular brightness matches. —*Journal abstract.*

1569. Jeeves, M. A. & Dixon, N. F. (U. St. Andrews, Scotland) **Hemisphere differences in response rates to visual stimuli.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 249-251. —In a series of experiments studying response times to unstructured visual stimuli it was found that visual stimulation going initially to the right hemisphere is responded to faster than stimulation going initially to the left hemisphere. A model is described to account for these results and also for consistent differences in rate of responding depending upon which of 4 possible response pathways is involved. —*Journal abstract.*

1570. Mayzner, M. S. (New York U.) **The disinhibited effect in sequential blanking.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 218-219.—H. K. Hartline and F. Ratliff (see PA, Vol. 29:3463) proposed a disinhibition effect in Limulus and recent studies have attempted to demonstrate such effects in the human visual system. The present study provides an analogue to the Hartline and Ratliff paradigm for the human visual system. Results from 10 male undergraduates suggest that such disinhibition phenomena may be operative in man's visual system.—*Journal abstract*.

1571. Millodot, Michel & Harper, Paul. (Brown U., Hunter Lab. of Psychology) **Measure of visual acuity by means of eye movements.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Dec), Vol. 46(12), 938-945.—Administered subjective and objective tests of visual acuity to 5 university students with normal vision, using the same target, with the same luminance and at the same distance. Objective measurements were obtained by evoking and arresting a pendular eye movement in response to a grating moved sinusoidally back and forth. Eye movements were recorded by a very precise electronic apparatus including a computer of average transients. Objective and subjective measurements of acuity were found to be highly correlated. The absolute value of acuity was higher when measured subjectively than when objective measures were used. The correlation between the objective and subjective measurements are in agreement with other investigations which differ greatly in method. (16 ref.)—*Journal abstract*.

1572. Saur, Roger L. (General Motors Corp., Research Lab., Warren, Mich.) **Influence of physiological factors on discomfort glare level.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(May), Vol. 46(5), 352-357.—Each of 35 Os adjusted the intensity of a sun-sized source to his borderline between visual comfort and discomfort (BCD). The measured BCD intensity of each O was compared with many of his physiological and visual characteristics. Os who complained of glare during daylight automobile driving had a lower BCD intensity which, however, could not be associated with any physiological or visual characteristics. This finding substantiates the concept that discomfort glare is a psychological phenomenon.—*Journal abstract*.

Perception

1573. Berger, Ralph J. (U. California, Santa Cruz) **REM sleep and mechanisms of oculomotor control.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 277-294.

1574. Bongard, M. M. & Golubtsov, K. V. (Inst. for Problems of Information-Transmission, Moscow, USSR) **O tipakh gorizontalnogo vzaimodeistviya, obespechivayushchikh normal'noe videnie peremeshchayushchikh po setchatke izobrazhenii (modelirovanie nekotorykh funktsii zreniya cheloveka).** [On types of horizontal interaction, providing normal vision of images displaced over the retina (simulation of several functions of human vision).] *Biofizika*, 1970, Vol. 15(2), 361-373.—Describes a model and its circuits, capable simultaneously of both normal perception of moving objects and the complete absence of perception of stationary images. A new type of horizontal interaction between channels was used to combine these properties. This was accomplished using a unidirectionally prop-

agated signal, produced through nonlinear transformation of the brightness gradient. The model automatically reproduces a number of properties of human vision: decline of visual acuity with low brightness, the Mach effect, and many features attendant upon the perception of stationary images.—*I. D. London*.

1575. Doty, Richard L. (Michigan State U.) **The effect of instructions on the middle category of a method of limits investigation of the "straight up-and-down position."** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 9-17.—Obtained measures of the visual "straight up-and-down" position for 18 male and 25 female undergraduates under 2 sets of instructions. One group of Os was told they were taking part in a study of tilt, and responded either "tilted" or "no" to settings of a luminous line of light. The other group was told the study was one of verticality, and responded either "no" or "vertical" to the same range of stimuli. The middle category of the tilt-instruction group was significantly larger than that of the vertical-instruction group. Tilt-instruction females had larger middle categories than tilt-instruction males and vertical-instruction males and females. Middle category sizes decreased with successive trials for both instructional groups.—*Journal summary*.

1576. Guralnick, Michael J. & Harvey, Karen G. (American U.) **Response requirements and performance in a visual vigilance task.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 215-217.—*Journal abstract*.

1578. Kahneman, Daniel & Wolman, Ruth E. (Hebrew U., Jerusalem, Israel) **Stroboscopic motion: Effects of duration and interval.** *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 161-164.—Presents an extension of a study by D. Kahneman (see PA, Vol. 42:6484) accounting for the effects of temporal factors on a stroboscopic motion. The quality of stroboscopic motion induced by the successive presentation of 2 illuminated squares obeys 2 rules. For all stimulus durations shorter than 100 msec., optimal motion occurs when the stimulus onsets differ by about 120 msec. For stimulus durations longer than 100 msec., optimal motion occurs when the 2nd stimulus begins at the termination of the 1st stimulus. The 2 rules relating quality of motion to duration suggest a single principle, i.e., that the quality depends only on the interval between the visual responses to the 2 stimuli. The interresponse interval at which motion is optimal is independent of stimulus duration.—*Journal abstract*.

1580. Pressey, A. W. (U. Manitoba, Winnipeg, Canada) **Sex differences on tests of visual figural aftereffects.** *Acta Psychologica, Amsterdam*, 1970(Sep), Vol. 34(1), 78-88.—Determined the nature of sex differences on tests of visual figural aftereffects (FAEs). In Exp. I, in which the method of adjustment was used with 280 female and 280 male undergraduates, the FAE increased as a negatively accelerated function of inspection time but no significant sex differences were exhibited. In Exp. II, in which a method of detection was

employed, 159 women reported significantly fewer occurrences of FAEs than 152 men. Inspection time, however, had no significant effect on the size of the FAE. In Exp. III with 80 male and 80 female Ss, an adjustment technique was used and, once again, sex differences were not revealed. It is concluded that sex differences are dependent on the method used to measure FAEs and that women exhibit smaller (or fewer) FAEs because they adopt a more conservative attitude in situations which have a high level of uncertainty.—*Journal abstract.*

1582. Sheppard, Joseph J., Stratton, Roy H., & Gazley, Carl. (Rand Corp., Santa Monica, Calif.) **Pseudocolor as a means of image enhancement.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Oct), Vol. 46(10), 735-754.—Human Os can distinguish more different colors than different shades of gray. If the scale of grays in a complex black-and-white image, i.e., X-ray, is transformed into a scale of colors, perception of the details will be greatly enhanced. In 1 versatile but expensive method of producing such pseudocolor images, the black-and-white image is photoelectrically scanned and a computer produces 3 pseudocolor separation positives (or negatives) directly on 35-mm film. A simpler and inexpensive method was developed which used purely photographic procedures. Examples of results with this procedure applied to chromosome photomicrographs. X-ray films, and pathological specimens are presented.—*Journal abstract.*

1583. Udo de Haes, Helias A. (Zoological Lab., Leiden, Netherlands) **Stability of apparent vertical and ocular countertorsion as a function of lateral tilt.** *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 137-142.—In Exp. I the inter- and intraindividual variance of the apparent vertical was established as a function of lateral body tilt. Both quantities increased with increasing degree of tilt, with a maximum at the inverted positions (150-180°). Because the apparent vertical depends mainly on the stimulation of the statolith organs, findings imply that these organs become less effective in indicating the vertical. In Exp. II the ocular countertorsion reflex was recorded photographically, simultaneously with measurement of the apparent vertical. This eye reflex, which also depends on the stimulation of the statolith organs, showed no change in variance level at body positions from 30-180°. The result is discussed with respect to the origin of the change in effectiveness of the statolith organs. (35 ref.)—*Journal abstract.*

1584. Welch, Robert B. & Abel, Marilyn R. (U. Kansas) **The generality of the "target-pointing effect" in prism adaptation.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 226-227.—12 undergraduates were used as their own controls in target-pointing and no-target conditions of prism (20 diopters) exposure. Before and after each exposure condition, target-pointing accuracy was tested via forward and lateral arm movement, the 1st of these being identical to the target-response made during prism exposure in the target-pointing condition. Target-pointing enhanced adaptation (the "target-pointing effect"), whether measured by the forward or lateral movement. This finding contradicts the suggestion that the target-pointing effect is limited to

measures of adaptation that entail visuomotor responses identical to those occurring in the exposure period of the target-pointing condition.—*Journal abstract.*

Size & Distance & Depth Perception

1585. Nelson, Thomas M. & Ladan, Carol J. (U. Alberta, Edmonton, Canada) **Size perceptions under several field conditions.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Jun), Vol. 46(6), 418-425.—Studied the apparent increase in the size of the moon compared with its size at zenith in an experiment using 70 undergraduates, chosen for their ability to match size reliably. Unlike previous research, this experiment was conducted in a laboratory setting, permitting study of variables in isolation and combination. Variables studied were: eye elevation, photic gradients, terrain characteristics, and apparent distance and movement. Results show that natural conditions were simulated satisfactorily. It is concluded that present unifactor theories are not sufficient for explanation of the phenomenon. All factors yield illusory effects in isolation. Results suggest that factors are not all additive regarding their size effects.—*Journal abstract.*

1586. Tolin, Phillip. (Central Washington State Coll.) **Relative size as a cue to the relative distances of random stereogram images.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 212-213.—With random letter stereograms as stimuli, 3 groups of 15 undergraduates, each made judgments of relative size and relative distance of paired stereo images varying in size but not in distance, as indexed by amount of retinal disparity. Ss in Group D were instructed that members of the stereo pairs differed in size and distance; Ss in Group S were told that there were distance differences but not size differences; Ss in Group N were told nothing about either relative sizes or relative distances. Differences in instructions regarding relative size did not affect relative size judgments: Ss typically reported the objectively larger image as being larger. Ss in all 3 groups reliably reported the objectively smaller image as being the more distant image.—*Journal abstract.*

Color Vision

1587. Dudek, Richard A. & Colton, George M. (Texas Technological Coll.) **Effects of lighting and background with common signal lights on human peripheral color vision.** *Human Factors*, 1970(Aug), Vol. 12(4), 401-407.—Investigated 2 aspects of binocular peripheral color vision important to an industrial situation, i.e., relative color fields of red, yellow, green, and blue test lights; and false color identification under independent variables of color of background, environmental light, and test position. 4 males with a similar peripheral vision field (within $\pm 2^\circ$ of one another) were used. In general, blue and yellow lights used on a gray background with a low level of environmental light gives the best results for the greatest recognition distance of color and the least number of errors made. Ss displayed large variation, indicating justification for an industrial firm to institute testing procedures to obtain workers who meet specific peripheral color vision requirements.—*Journal abstract.*

1588. Helson, H. & Lansford, T. G. (U. Massachusetts) **The role of spectral energy of source and background color in the pleasantness of object**

colors. *Applied Optics*, 1970, Vol. 9(7), 1513-1562.—5 men and 5 women rated 125 object colors on 25 colored backgrounds in 5 sources of illumination. Foods and complexions were also rated in the same sources. Main effects were found to be highly significant statistically: (a) lightness and chromatic contrasts of object and background colors were more important than quality of illuminants; (b) men preferred cool source and background colors, and women warm colors; (c) best background colors had either low chroma and high reflectance (pastel colors) or low chroma and low reflectance; (d) most important factor determining pleasantness of color combinations was lightness contrast; (e) some closely related color families may be substituted for one another to make good color combinations; and (f) interactions of source, background, and object colors help to account for the conflicting statements often found in the literature regarding color harmony.—*Author abstract.*

1589. **Hidalgo, Zeta D.** (Indiana U., Div. of Optometry) **Effects of intermittent stimulation on hue and saturation discrimination of color defectives and normals.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Dec), Vol. 46(12), 929-938.—Extended the investigation of R. J. Ball and S. H. Bartley (see PA, Vol. 43:7623) on inducing and reducing errors of color defectives on saturation discrimination to hue discrimination tasks. 12 color defectives (6 were male optometry students) and two normals were tested on standard and specially designed pseudo-isochromatic plates illuminated intermittently by a daylight source. A range of 2-12 cycles of light and dark/sec was used and the lengths of the light pulse varied from $\frac{3}{4}$ - $\frac{1}{4}$ the cycle duration. Errors on hue and saturation discrimination plates increased with short light pulses. Results complement those of the previous experiment except that instances of real improvement in color vision test performance at long pulses are difficult to establish with certainty.—*Journal abstract.*

Form & Pattern Discrimination

1590. **Bláha, Svatopluk.** **The convergence of a committee solution of the pattern recognition problem.** *Kybernetika*, 1969, Vol. 5(6), 474-483.—Deals with the problem of the convergence of the error-correction training procedures with a correction increment for the committee solution of pattern recognition problem. The training procedure converges, if the angles between solution vectors and weight vectors are reduced at every step of training process. It was proven that the type of training procedures described cannot secure the convergence to the solution of the problem. Only stochastic training can be successful. (Czech summary)—*Journal abstract.*

1591. **Dick, A. O.** (U. Rochester) **Stimulus variables in single-letter recognition.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 195-196.—Examined the role of some stimulus variables in determining single-letter recognition in 30 undergraduates. The 26 letters of the alphabet were presented individually with systematic manipulations of size and exposure duration. Results show that recognition accuracy is a function of both size and exposure duration. These data imply that present conceptions of feature analysis are somewhat incomplete.—*Journal abstract.*

1592. **Nielsen, Vigo H.** (Indiana U., Div. of Optometry) **Recognition of regular polygons in relation to visual acuity.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(May), Vol. 46(5), 378-386.—Determined recognition thresholds, under favorable viewing conditions, for a Landolt C and 5 equal area regular polygons having 3, 4, 5, 6, and 8 sides. In Part I (Landolt C) there were 6 Os and 2168 presentations. In Part II (polygons) there were 7 Os and 10,080 presentations. Threshold for the Landolt C was established where the outer diameter subtended a visual angle of 1.93 min. of arc (visual acuity 2.59). Thresholds for the 5 polygons were established where the length of a side in each polygon subtended a visual angle between 2 and 2.5 min. of arc. Data indicate a direct proportionality between the reciprocal threshold distances of the 5 polygons and their number of sides. Furthermore, data suggest that the discrimination of a regular polygon is a function of the length of its sides. Comparison is attempted between recognition of clinically-used visual acuity targets and regular polygons. (17 ref.)—*Journal abstract.*

Eye Movement

Brightness & Contrast Discrimination

1596. **Flock, Howard R. & Noguchi, Kaoru.** (York U., Toronto, Ontario, Canada) **An experimental test of Jameson and Hurvich's theory of brightness contrast.** *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 129-136.—252 brightness functions for 7 simultaneously presented black, gray, and white squares on black, gray, and white backgrounds approximated power curves with positive exponents when illuminance was varied in 7 steps over 1.9 log luminances. 12 Ss with a median age of 20 yr. participated in the experiment. Mean exponents were significantly larger for whiter vs. blacker squares and for squares on the white vs. gray background. Mean exponents also increased more for squares on white than on black or gray backgrounds. Finally, a white replacing a black background elicited increasingly larger decremental responses as the squares varied from black to white. D. Jameson and L. Hurvich's opponent-process

theory, tested by the experiment, was not predictive. (19 ref.)—*Journal abstract.*

1597. Sato, Aiko. (Nara Women's U., Japan) [Brightness enhancement of flicker and response variability.] *Japanese Journal of Psychology*, 1969(Dec), Vol. 40(5), 267-272.—Measured increment thresholds and apparent brightness of flicker to confirm the hypothesis that at low range of flicker, when apparent brightness increases, O's response variability increases. Underlying this phenomenon is the principle of optimum efficiency of neural activity, operating through the mediation of temporal configuration of stimuli. Therefore, as long as the stimulus is flicker, similar results will be obtained if Os are given some other task than brightness matching. Results indicate that at 6-12.5 cps, thresholds were lower and response variability larger than at 19-46 cps. At 4-8 cps, apparent brightness increased and variability was larger than at 12.5-46 cps. Os were divided into 2 types in response variability.—*English abstract.*

AUDITION

Perception

1599. Bothe, Gary G. & Marks, Lawrence E. (Florida State U.) **Absolute sensitivity to white noise under auxiliary visual stimulation.** *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 176-178.—Measured absolute sensitivity to white noise with O in the dark, in constant illumination, and in the dark but with sound-synchronized flashes of light at 3 different intensities. A confidence rating procedure was used, and results were analyzed in terms of the theory of signal detectability. There appeared to be no consistent effect of auxiliary visual stimulation on absolute auditory sensitivity for the 4 Os examined.—*Journal abstract.*

1600. Elfner, Lloyd F. & Delaune, William R. (Florida State U.) **Detection of shift in binaural images: A rating method approach.** *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 158-160.—Two practiced listeners were run in a lateralization task in which a rating method was employed. The detection of right and left shifts from the center position was determined. The effect of frequency of the signal was also assessed in the lateralization task. In addition, 9 naive undergraduate listeners were run in a similar situation to determine the feasibility of using the rating method approach with untrained Ss. 1st-half, 2nd-half comparisons were determined to check reliability of the technique and also to evaluate the effect of number of trials. Results indicate the procedure is promising for the study of directional shifts in binaural stimuli with practiced listeners.—*Journal abstract.*

1601. Ingham, J. G. (Llandough Hosp., Penarth, Glamorgan, England) **Individual differences in signal detection.** *Acta Psychologica, Amsterdam*, 1970(Sep), Vol. 34(1), 39-50.—Examines whether individual differences in sensitivity and response bias can be studied, using indices like the d' and β of signal detectability theory. Sensitivity, measured by d' , is not influenced by variations in β provided the variance of the noise distribution is equal to that of the signal-plus-noise distribution, but no such deduction can be made for β .

The intraindividual variances can be assumed to be approximately equal, and d' may therefore be estimated without contamination by β . It cannot be assumed, however, that β remains stable for different levels of d' ; in fact it can be shown to depend upon the decision strategy adopted by S. The consistency and orthogonality of indices of sensitivity and bias have been examined in an auditory detection task. Reasonably consistent estimates of d' were obtained from as few as 40 responses. The bias index β was less satisfactory but another index related to it was more promising. The latter was orthogonal to d' , under certain conditions, in the 2-dimensional space describing interindividual variation in detection behavior.—*Journal abstract.*

1602. Larkin, Willard & Greenberg, Gordon Z. (U. Maryland) **Selective attention in uncertain frequency detection.** *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 179-184.—Studied uncertain frequency detection of brief sinusoids in noise in a special Yes-No paradigm that included single-frequency trials randomly interleaved with trials on which either of 2 frequencies could be presented. Contrary to implications from previous studies, and to sensory filter models of attention, Os' deliberate attempts to impose narrow- or wide-band listening had only a small effect on the relative detectability of signals at 500 and 1100 Hz. If frequency selectivity is to be understood as sensitivity adjustment (rather than as a recognition process), the relevant parameters may be entirely stimulus determined. (19 ref.)—*Journal abstract.*

1603. Sarris, Viktor; Tews, Birgit, & Schönpflug, Wolfgang. (U. Duesseldorf, W. Germany) **GSR and the anchoring of pitch judgments.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 193-194.—Tested and confirmed the arousal hypothesis that anchor stimuli produce specific GSR effects. Ss were 90 undergraduates. Further investigation is recommended concerning whether or not the quartic GSR trend that was found reflects context effects.—*Journal abstract.*

1604. Simon, J. Richard; Hinrichs, James V., & Craft, John L. (U. Iowa) **Auditory S-R compatibility: Reaction time as a function of ear-hand correspondence and ear-response-location correspondence.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 97-102.—Presents 2 experiments concerned with identifying the factors responsible for stimulus-response (S-R) compatibility in auditory information processing. In Exp. I, 32 undergraduates pressed keys located to the right or left of the body midline in response to monaurally presented tonal commands signifying right- or left-hand responses. Ss performed on both uncrossed- and crossed-arms trials. Results indicate that ear-response-location correspondence was the crucial factor accounting for S-R compatibility. In Exp. II, 32 Ss responded with the right or left hand, depending on the ear in which a monaural tone was presented. Ss followed both corresponding and noncorresponding ear-hand instructions on uncrossed- and crossed-arms trials. Results indicate that both ear-hand correspondence and ear-response-location correspondence contributed to S-R compatibility.—*Journal abstract.*

1605. Warren, Richard M., Obusek, Charles J., Farmer, Richard M., & Warren, Roslyn P. (U. Wisconsin, Milwaukee) **Auditory sequence: Confusion of patterns other than speech or music.** *Science*, 1968(May), Vol. 164(3879), 586-587.—Accurate perception of temporal order is essential for many auditory tasks. Yet in an

experiment with 150 undergraduates, the temporal pattern of 4 successive sounds (i.e., hisses, buzzes, and tones) could not be recognized even when the duration of each sound was considerably longer than either average phoneme in normal discourse or notes of melodies. Although each stimuli was perceived, their order remained elusive.—*Journal abstract.*

Speech Discrimination

During REM periods, Ss dreamt less about physical activity after the evening of exercise and less about thinking and problem solving after studying. After studying, there was more social interaction/character in Ss' dreams. Mentation from NREM periods after exercise also showed less physical activity, but after studying it was characterized by a more tense mood. Ss were involved more in what was going on in NREM mentation after studying. Ss said they slept soundest after exercise, and the more they felt involved in REM mentation, the less soundly they reported sleeping. (18 ref.)—*Journal abstract*.

Imagination conditions. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5676-5677.

1648. Miller, Robert J., Lundy, Richard M., & Galbraith, Gary G. (Pennsylvania State U.) **Effects of hypnotically induced hallucination of a color filter.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 316-319.—Examined the ability of 10 hypnotized undergraduates to hallucinate the presence of a colored filter before their eyes. Ss were presented with a green number of low brightness projected onto a screen. A bright red light was simultaneously projected onto the same area of the screen so that the number was not visible to the naked eye but was clearly visible when a green filter was worn. All Ss reported hallucinating the green filter and reported a resultant change in the color of the red stimulus. No S, however, was able to see the number.—*Journal abstract*.

1650. Brown, Sheila F. (Rutgers State U.) **Defense mechanisms and the behavioral control of stress.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5684.

1651. Epstein, Seymour & Roupelian, Armen. (U. Massachusetts) **Heart rate and skin conductance during experimentally induced anxiety: The effect of uncertainty about receiving a noxious stimulus.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 20-28.—45 undergraduates were divided into 3 equal groups differing in expectancy for receiving an unavoidable noxious stimulus on the count of 10 in a 15-number countup. One group was told that the likelihood of receiving a shock was 5%, another 50%, and another 95%. 2 trials were presented. In the 1st, no S received a shock; in the 2nd, all Ss received a shock. For both heart rate and skin conductance, the 5% expectancy group exhibited the greatest, and the 95% group the least, arousal during the anticipatory period. On both measures, the 5% expectancy group exhibited the greatest impact effect. It is concluded that within limits, low expectancy about the occurrence of an unavoidable threatening event increases anticipatory anxiety as well as the reaction to impact. (19 ref.)—*Journal abstract*.

1652. Glass, David C., Gordon, Andrew, & Henchy, Thomas. (Russell Sage Foundation, New York, N.Y.) **The effects of social stimuli on psychophysiological reactivity to an aversive film.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 255-256.—Induced stress in 78 male undergraduates by an aversive film, and measured stress responses by tonic skin conductance and self-reports of tension. Contrary to initial expectations, skin conductance levels were greater in the presence of a friend than a stranger and greater than in a condition where Ss watched the film alone. Results also show that a friend who was blocked from view produced higher levels of skin conductance and subjective tension than did a friend who was visible to the S, whereas the effect was just the opposite for visible and nonvisible strangers. Both sets of findings are interpreted in terms of conflicting needs for anonymity and emotional comparison.—*Journal abstract*.

1653. Hammerton, M. & Tickner, A. H. (Medical

Research Council, Cambridge, England) **An investigation into the effects of stress upon skilled performance.** *Ergonomics*, 1969(Nov), Vol. 12(6), 851-855.—Investigated the effect of an anxiety-producing situation upon skill in an acquisition tracking task. Parachutists at 3 levels of practice were examined. 19 experienced Regular Army men, 9 Regular Army trainees, and 16 Territorial Army (TA) trainees. It was found that the TA were more affected ($p < .05$) than the Regular trainees, who were more affected ($p < .001$) than the experienced Regulars, who were not affected at all. It is concluded that anxiety does produce a decrement although such decrements can be minimized by appropriate training. An investigation into the best form of such training is suggested. (German & French summaries)—*Journal abstract*.

1654. Martens, Rainer & Landers, Daniel M. (U. Illinois, Motor Performance & Play Research Lab., Children's Research Center) **Motor performance under stress: A test of the inverted-U hypothesis.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 29-37.—Investigated whether the relationship between arousal and motor performance among junior high school males supports the inverted U hypothesis. Based on the CMA scale, Ss were either low, medium, or high in trait anxiety and were subjected to 1 of 3 levels of psychological stress. A 3×3 factorial design was used with 10 Ss/cell. Results support the inverted U hypothesis for the stress factor and the anxiety factor separately. These 2 factors, however, did not interact to affect motor performance. Heart rates, palmar sweat prints, and questionnaire responses provided corroborative support for the behavioral results. (32 ref.)—*Journal abstract*.

ATTENTION & EXPECTANCY & SET

1657. Crandall, James E. (U. Idaho) **Preference and expectancy arousal: Further evidence.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 267-268.—Investigated undergraduates' reactions to videotaped lectures in order to determine whether or not the relations between preference and expectancy arousal, and preference and expectancy confirmation, would be the same as previously found with different procedures and much simpler stimuli. The results were generally consistent with the earlier research, and extend the generality of the finding that capacity of stimuli to arouse expectancies has a more positive effect upon interest than does capacity to confirm expectancies.—*Author abstract*.

1658. Daniel, Jozef. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Further variants of Stroop's interference test.** *Studia Psychologica*, 1970, Vol. 12(1), 81-81.

1659. Halmiová, Olga. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Attentiveness and strength of the excitation processes.** *Studia Psychologica*, 1970, Vol. 12(1), 75-78.—Supports the hypothesis that Ss with weak excitation processes will perform better in a short-term test

than those with strong excitation processes. A 10-min Bourdon test administered to 30 17-18 yr. old boys and girls, revealed a correlation of statistical significance between weakness of excitation processes and speed of performance. This was true even after the addition of a 2nd task (counting sound stimuli). Since results of other studies are partially contradictory, it is suggested the data in further experiments be verified.—*Journal summary*.

1660. Šípoš, Ivan. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Vigilance performance in verbal signals.** *Studia Psychologica*, 1970, Vol. 12(1), 29-33.—From groups of words presented every 5 sec., 53 undergraduates in a 1-hr session, (a) identified 1 of 3-10 words with which they had been made acquainted before the experiment (33 Ss), and (b) at a signal word, wrote down the 3rd (10 Ss) or 4th (10 Ss) word preceding the signal word. 90 different words were repeated in the test, and the set of words was balanced as to word frequency (high-low) and 3 word categories (nouns, adjectives, verbs). Results show that Ss' performance in the 1-hr session did not decline as a function of time. (Czech & Russian summaries)—*Journal abstract*.

MOTOR PERFORMANCE

1661. Carment, D. W. & Latchford, Margaret. (McMaster U., Hamilton, Ontario, Canada) **Rate of simple motor responding as a function of coaction, sex of the participants, and the presence or absence of the experimenter.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 253-254.—48 male and 48 female undergraduates performed a simple motor task, $\frac{1}{2}$ alone and $\frac{1}{2}$ coacting. $\frac{1}{2}$ of these Ss responded while E was not present. The dependent variable was rate of responding. Ss responded more rapidly and social facilitation appeared only when E was present. In E's absence rate of responding declined and solitary Ss responded more rapidly than coacting Ss. Implications for a learned-drive interpretation are noted.—*Journal abstract*.

1662. Flaningam, Michael R. (U. Arizona) **Influence of rest interval content on pursuit rotor learning and performance.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5709-5710.

REACTION TIME

1663. Baron, Robert A. (U. South Carolina) **Effects of magnitude of model's apparent pain on observer reaction time.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 229-231.—Hypothesized that the degree of emotional arousal vicariously induced among 48 male undergraduates would increase as the magnitude of pain cues emitted by the model increased. Thus, it was predicted that O RT would decrease as the suffering of the model appeared to grow in intensity. Results indicate that contrary to the prediction, O RT increased significantly as the magnitude of pain shown by the model increased.—*Journal abstract*.

1664. Bernstein, Ira H. & Eason, Thomas R. (U. Texas, Arlington) **Use of tone offset to facilitate reaction time to light onset.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 209-210.—4 undergraduates participated in a visual discriminative RT task to explore the phenomenon of intersensory facilitation. Previous research has indicated that RT to a joint visual-auditory

event is more rapid than RT to the visual component alone, even when the auditory component is noninformative. In the present study, a tone offset was used in place of the usual affirmative event (click.) Results indicate that RT is more rapid when the tone offset in conjunction with the occurrence of the visual event as compared to when the tone remained on throughout the trial. The effect was comparable in magnitude to that obtained in prior studies using an affirmative auditory event.—*Journal abstract*.

1665. Orenstein, Howard B. (Furman U.) **Reaction time as a function of perceptual bias, response bias, and stimulus discriminability.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 38-42.—Examined the effects of stimulus discriminability, stimulus frequency, and response frequency in a choice RT task with 60 undergraduates. 2 levels of response frequency ratio (i.e., 1 of 2 responses occurred 2 or 5 times as often as the other) were combined with 3 levels of stimulus configuration. Configuration was defined by the spatial distance between 3 stimulus lights. Perceptual bias was assessed by the difference in RT between stimuli of equal or unequal presentation probability associated with the same response. Response bias was assessed by the difference in RT between stimuli of equal presentation probability associated with separate responses which had unequal frequencies of occurrence. Results offer evidence for perceptual bias only, but these effects depend upon the arrangement of the stimulus configuration.—*Journal abstract*.

1666. Remington, Robert J. (IBM Corp., Research Triangle Park, N.C.) **The repetition effect: A methodological consideration.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 221-222.—Examined the appropriateness of averaging RTs for stimulus events with different probabilities of occurrence in determining the magnitude of the repetition effect. Each of 5 Ss performed under 2 experimental conditions: (a) a 2-choice condition in which the stimulus events were equiprobable, and (b) a 2-choice condition in which 1 of the stimulus events appeared with the probability of .7. A detailed analysis of the data demonstrated how the commonly used averaging process can lead to misleading interpretations regarding the nature of the repetition effect.—*Journal abstract*.

LEARNING

1667. Baum, Morrie. (Bishop's U., Lennoxville, Quebec, Canada) **Extinction of avoidance responding through response prevention (flooding).** *Psychological Bulletin*, 1970(Oct), Vol. 74(4), 276-284.—Discusses the resistance to extinction of avoidance responding, and describes a treatment for hastening extinction. The treatment, known as response prevention (flooding), consists of thwarting the avoidance response while forcing the S to remain in the situation which it fears. Behavior therapy analogues to response prevention are reviewed, and the various factors which determine the efficacy of response prevention with animals are described. Pharmacological and behavioral techniques for enhancing the effectiveness of response prevention are noted. 3 theories (2-process theory, competing response theory, and a relaxation analysis), which attempt to explain why and how response prevention works, are discussed, and it is concluded that no 1 theory provides

an adequate account of all the results obtained. (49 ref.)—*Journal abstract.*

1668. Foppa, Klaus. (2 Sennweg, Bern, Switzerland) **Psychologie des Lernens.** [Psychology of learning.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 83-88.—Proposes that learning may be categorized into 3 main processes: acquisition of knowledge through rote memorization, acquisition or change of behavior, and classic conditioning. Tolman's theory of "purposive behavior" and trends in syntactic content of material being used in current learning experiments are discussed.—*B. A. Stanton.*

1671. Muller, Douglas G. (New Mexico State U.) **The transfer of letter training to a word reading task.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 97-107.—Examined reading from a transfer of paired-associates learning view. 10 adult volunteers from upper division education courses were randomly assigned to each of 11 treatment conditions. Ss learned names to artificial letters and words. The transfer paradigms employed were A-B, A₁-B₁; A-B, A₂-B₂; A-Observe A₁-B₁; A-B, C₁-B₁; A-B, C₂-B₂; and —, A₁-B₁. The subscript, c, indicates compounds of 1st task stimulus or response elements. Results approximate those of corresponding traditional paradigms with all groups displaying positive transfer.—*Author abstract.*

1672. Parker, Ronald K. (City U. New York, Center for Advanced Study in Education) **The effects of state instructions and schedules of reinforcement on resistance to extinction.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 233-234.—Used 70 female undergraduates in an experimental design manipulating state instructions and 7 schedules of reinforcement (0-100% in increments of 1/6). The state instructions required Ss to guess before each trial if they were ever going to be reinforced again throughout 30 acquisition and 60 extinction trials, i.e., S guessed whether she was in an experimental state of acquisition or extinction. The most lean schedules of reinforcement (1/6 and 2/6) were most resistant to extinction; however, the resistance to extinction was not related in an orderly fashion to schedule of reinforcement.—*Journal abstract.*

1673. Pozar, L. **Study of some factors conditioning perceptual-motor learning.** *Studia Psychologica*, 1970, Vol. 12(1), 81-83.

1674. Reader, A. V. (U. Manchester, England) **Conditional reflexes and learning machines.** *Acta Psychologica, Amsterdam*, 1970(Sep), Vol. 34(1), 98-105.—Describes a proposed learning machine which learns by avoidance but also exhibits CR behavior. The design provides for any number of CRs, the mechanisms of which simultaneously share the common memory of the avoidance learning machine. The process of reinforcement-extinction of the CR is different from the reinforcement-inhibition mechanism of the avoidance learning machine.—*Journal abstract.*

1675. Seligman, Martin E. (Cornell U.) **On the generality of the laws of learning.** *Psychological Review*, 1970(Sep), Vol. 77(5), 406-418.—That all events are equally associable and obey common laws is a central assumption of general process learning theory. A continuum of preparedness is defined which holds that organisms are prepared to associate certain events, unprepared for some, and contraprepared for others. A review of data from the traditional learning paradigms shows that the assumption of equivalent associability is false. Examples from experiments in classical conditioning, instrumental training, discrimination training, and avoidance training support the assumption. Language acquisition and the functional autonomy of motives are also viewed using the preparedness continuum. It is speculated that the laws of learning themselves may vary with the preparedness of the organism for the association and that different physiological and cognitive mechanisms may covary with the dimension. (2 p. ref.)—*Journal abstract.*

1676. Sturges, Persis T. & Donaldson, Patricia L. (Chico State Coll.) **Acquisition of incorrect and correct alternatives with increased intervals before and after informative feedback.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 86-90.—Combined 3 delay and postinformative feedback intervals with 1 or 2 trials on 20 verbal triplets, with stimulus material absent during the intervals in Exp. I and present in Exp. II. Ss were 162 and 90 undergraduates, respectively. 2 tests measured the words identified as stimulus words, correct and incorrect alternatives, and associations between the stimulus word and correct and incorrect alternatives. Feedback delay resulted in more incorrect stimulus-response associations in both experiments and more correct alternatives and stimulus words identified in Exp. I. Increased postfeedback intervals resulted in more incorrect alternatives and stimulus words identified in Exp. II. It is concluded that Ss use delay and postfeedback intervals to acquire information about all units of the items rather than simply to rehearse the correct alternative.—*Journal abstract.*

Conditioning

1678. Abell, Andrew T. (Westminster Coll., New Wilmington, Pa.) **Words functioning simultaneously as negative operant reinforcers and unconditioned stimuli.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 254.—A conditioning device made of paper (reinforcer form) allowed exposures of unpleasant words and of neutral ones to be dependent upon motor responses to 2 CVCs. Ss were 112 undergraduates. As predicted, Ss tended to expose neutral words rather than unpleasant ones, and subsequently rated the CVC associated with unpleasant words as less pleasant than the other trigram.—*Journal abstract.*

1679. Bakker-DePree, B. J., Defares, P. B., & Zwaan, E. J. (U. Groningen, Netherlands) **The conditioning of evaluative meaning.** *Acta Psychologica, Amsterdam*, 1970(Jun), Vol. 32(3), 281-289.—Performed 4 experiments for conditioning evaluative meaning in nonsense syllables with lower technical school students. The procedure developed by C. K. Staats and A. W. Staats

(see PA, Vol. 33:741, and 7843) had to be modified in 2 ways to be effective. 1st, an additional measurement of evaluative meaning of the nonsense syllables was introduced before the conditioning trials. These evaluative scores (ES1) were used (a) to select an initially neutral syllable for conditioning, and (b) to measure the conditioning effect by subtracting the evaluative score obtained after the conditioning trials (ES2) from the ES1. 2nd, a distraction task was given during the conditioning trials. Conditioning could only be demonstrated if the criteria of selection for the UCS nouns and semantic differentials were based on the evaluative meaning responses to these words from the Ss' population.—*Journal abstract.*

1680. Cerekwicki, Louise E. (U. Wisconsin) **Effects of conditioned stimulus relatedness and interstimulus interval upon differential eyelid conditioning to words.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5707-5708.

1681. Johns, Themis R. (U. Miami) **Heart rate control in humans under paced respiration and restricted movement: The effect of instructions and exteroceptive feedback.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5712-5713.

1683. Weiner, Harold. (St. Elizabeths Hosp., Lab. of Human Behavior, Washington, D.C.) **History-related effects upon human escape responding: Are induction or extinction processes involved?** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 207-208.—Exposed 18-63 yr. olds given either a fixed ratio (FR) 40 or DRL 20-sec conditioning history to an extinction procedure and then conditioned them under an escape schedule. Despite comparable cessation of responding during extinction, FR 40-history Ss produced high-rate escape responding, while DRL 20-sec-history Ss gave low-rate escape responding. Taken in conjunction with previous findings, results suggest that response induction rather than differential extinction is responsible for the persistence of FR- and DRL-history effects upon escape responding.—*Journal abstract.*

Verbal Learning

1684. Dey, Mukul K. (McMaster U., Hamilton, Ontario, Canada) **Generalization of position association in rote serial learning.** *American Journal of Psychology*, 1970(Jun), Vol. 83(2), 248-255.—36 male undergraduates practiced 2 serial lists of identical length in haphazard alternation. At each position in a list, a maximum number of intruding responses arrived from the same position in the other list, and the frequency of intrusion from a nonidentical position in the other list declined with increased positional disparity in either direction. The reliability of this gradient-like phenomenon, which could not be verified by the method of trend analysis because of insufficient data, is partially indicated by the occurrence of interlist intrusions at a significantly higher rate between identical than between nonidentical positions. Results support the hypothesis that associations not only develop between the items of a rote series and their serial positions but also generalize between positions in inverse proportion to the intervening distance.—*Journal abstract.*

1685. Gaite, Andrew J. (U. Toronto, Ontario, Canada) **A study of retroactive inhibition and facilitation in meaningful verbal learning.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5285.

1688. Melone, Frank A. (Syracuse U.) **Effect of priming serially learned common usage and slang definitions on associative responses to double-entendre words.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5717.

1689. Okaichi, Hiroshige. (Doshisha U., Kyoto, Japan) [The effects of induced muscular tension and original muscular tension in verbal learning.] *Japanese Journal of Psychology*, 1970(Apr), Vol. 41(1), 20-29.—88 undergraduates in 2 experiments learned a list of nonsense syllables or paired verbs. Time intervals between list presentation and recall were 0, 100, 200, and 360 sec. for nonsense syllables, and 0, 60, 120, and 180 sec. for paired verbs. Ss were divided into 4 groups by whether they were given induced muscular tension (MT) during learning and recall, and then further divided into subgroups of high and low MT. Results indicate that recall was facilitated under induced MT, and was better in high MT groups than in low. The aftereffect of induced MT was shown up to 120 sec. after acquisition. (37 ref.)—*English abstract.*

1690. Paul, Coleman. (Adelphi U.) **Acquired equivalence of correct alternatives after verbal discrimination learning.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 123-125.—10 undergraduates learned a verbal discrimination list consisting of 12 word pairs. In a subsequent transfer task, the 24 words constituting the 12 pairs were presented singly; a common label was "learned" to each of the formerly correct words and a different common label, to each of the formerly incorrect members of their respective pairs. Results indicate that correct and incorrect alternatives, respectively, had acquired functional equivalence. Results help to explain "rule" effects in verbal discrimination performance.—*Journal abstract.*

1691. Persensky, J. J. & Senter, R. J. (U. Cincinnati) **An investigation of "bizarre" imagery as a mnemonic device.** *Psychological Record*, 1970(Spr), Vol. 20(2), 145-150.—Examined the role of bizarre mental imagery as a mnemonic device in the learning of 2 serial verbal lists using various instruction conditions, i.e., free learning (FL), paired-associate learning (PA), and mnemonic techniques (MN). Number of stimulus lists and type of material to be learned were also investigated. The instructions and test materials were presented in printed form to a group of 179 undergraduates. Results indicate that the mnemonic instruction condition facilitated performance when compared with the other conditions. No significant effects were found for number of stimulus lists or type of material. Support for the use of bizarre mental imagery in mnemonic systems for the learning of serial verbal lists is presented.—*Journal abstract.*

1692. Prytulak, Lubomir S. (Stanford U.) **Natural language mediation.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5722.

1693. Skeen, David R. (Muskogum Coll.) **Study**

interval, manipulated frequency, and verbal discrimination learning. *Psychological Record*, 1970(Win), Vol. 20(1), 111-117.—Investigated 2 hypotheses suggested by a frequency theory of verbal discrimination learning: (a) that an increase in study time would facilitate acquisition of a verbal discrimination list; and (b) that increasing familiarization with stimulus materials prior to training would retard acquisition rate of a verbal discrimination list. Ss were 80 female undergraduates. 2- and 4-sec study intervals were factorially combined with verbal discrimination pairs of high and low frequency. Free recall learning was employed to produce frequency differentials among discrimination pairs. No evidence was found to support the hypothesis regarding a possible relationship between study time and verbal discrimination acquisition. A significant effect in speed of acquisition due to differential frequency was obtained, indicating faster learning of low frequency pairs.—*Journal abstract*.

1694. Snyder, C. R. & Katahn, Martin. (Vanderbilt U.) **The relationship of state anxiety, feedback, and ongoing self-reported affect to performance in complex verbal learning.** *American Journal of Psychology*, 1970(Jun), Vol. 83(2), 237-247.—Feedback consisted of comparisons with high, average, and low standards of achievement; the verbal-learning task correlated .40 with actual classroom learning. 30 male undergraduates served as Ss in each of 3 groups. Higher anxiety was found to be significantly related to poorer performance on the task. Going from high, to average, to low standards of comparisons, there was a significant trend for performance to improve. Positive self-reported affects correlated positively with performance and negative affects correlated negatively. For the medium- and low-anxiety groups, a majority of the positive affects correlated positively and a majority of the negative affects correlated negatively. For the high-anxiety group, however, a majority of the positive affects correlated negatively and a majority of the negative affects correlated positively with performance. Affect change preceded establishment of any significant affect-performance correlations. That the significant effects of feedback and anxiety were not reflected in the self-report scales of affect highlights the importance of verifying the outcome of experimental manipulations assumed on an a priori basis to alter the S's internal state.—*Journal abstract*.

1695. Suls, Jerry M. & Weisberg, Robert W. (Temple U.) **Processing syntactically ambiguous sentences.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 112-114.—Used intrasentence word association to investigate the psychological organization of syntactically ambiguous sentences. 85 undergraduates learned an ambiguous sentence preceded by a disambiguating verbal context, and then responded to words from the sentence with other words from the sentence. The verbal context presented to a given S made 1 of the interpretations of the ambiguous sentence highly probable. It was predicted that the pattern of intrasentence word associations would conform to that of the deep structure called for by the context. Results support the predictions and indicate that the interpretation given an ambiguous sentence is related to the verbal context in which the sentence appears. Results also indicate that deep structure relations played a dominant role in determining the psychological organization of sentences, as assessed through intrasentence word association.—*Journal abstract*.

1696. Wike, Sharron S. (U. Kansas) **The effects of feedback, guessing and anticipation rate upon verbal discrimination learning.** *Psychological Record*, 1970(Spr), Vol. 20(2), 171-178.—Investigated the effect of: (a) feedback of the correct items vs. the incorrect items, (b) 1st-trial guessing vs. no guessing, and (c) anticipation rate of 2 vs. 6 sec. upon verbal discrimination learning using 80 undergraduates. Correct feedback lead to fewer errors. A pair of items A and B may be mastered by learning A is correct or B is incorrect or both. Ss with the correct feedback reported using the strategy A was correct more often, and Ss with the incorrect feedback reported using the strategy B was incorrect more often. Correct feedback also resulted in a higher proportion of correct items recalled.—*Journal abstract*.

1697. Wike, Sharron S. (U. Kansas) **The effects of feedback, first-trial guessing and anticipation rate upon verbal discrimination learning.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5727-5728.

1698. Wike, Sharron S. & Wike, Edward L. (U. Kansas) **The isolation effect and verbal discrimination learning.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 217.—Studied verbal-discrimination learning in a 2×2 factorial design with isolation vs. no isolation of a pair of items as 1 factor and isolation vs. no isolation of the correct item feedback as the other factor. Ss were 36 undergraduates, 9 to a group. It was found that there were significantly fewer errors on the isolated item when the pair was isolated, but not when the feedback was isolated.—*Journal abstract*.

1699. Wong, Martin R. (U. South Florida, Coll. of Education) **Retroactive inhibition in meaningful verbal learning.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 410-415.—Attempted to generate retroactive inhibition with meaningfully learned prose materials by tightly specifying the similarity dimension between original learning and interpolated learning, and by defining identical stimulus elements for original learning, interpolated learning, and test of original learning. A 3×5 analysis of covariance design was used with 5 treatments varying in amount of guidance given to the Ss, and 3 retention intervals. Data were obtained from 685 undergraduates. Results show no statistically significant differences to indicate retroactive inhibition. However, mean scores for all 6 groups which read similar interpolated learning material were lower than each appropriate control group. (22 ref.)—*Journal abstract*.

1700. Woodward, Addison E. (U. Toronto, Ontario, Canada) **A search for the stimulus in serial learning.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5729.

1701. Yamagata, Kyoko. (Kyoto U., Japan) [The effects of overlearning on backward serial learning.] *Japanese Journal of Psychology*, 1970(Apr), Vol. 41(1), 9-19.—Studied the effect of amount of List-I learning (1 perfect recitation and overlearning) on backward serial learning by anticipation in Exp. I and II, and the recall method in Exp. III. There was no transfer effect in Exp. I and II, but in Exp. III, positive transfer was obtained and overlearning was found in the earlier stage of learning. Results are discussed in terms of the differences in the nature of the task and the procedure employed, and the concept of the sequential organization is suggested as a possible explanation. (30 ref.)—*English abstract*.

Verbal Paired Associate Learning

1702. Aagard, James A. (Utah State U.) **Affect and meaningfulness as variables in mediate association.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5705-5706.

1703. Adams, Jack A. & Bray, Norman W. (U. Illinois) **A closed-loop theory of paired-associate verbal learning.** *Psychological Review*, 1970(Sep), Vol. 77(5), 385-405.—Basic to the theory are 2 associative states, a dependency of recall on stimulus identification, mediation, and response feedback which is compared against an internal reference mechanism for judgment about correctness of the response. Data in support of the theory are presented. (3 p. ref.)—*Journal abstract.*

1704. Dey, Mukul K. (McMaster U., Hamilton, Ontario, Canada) **Influences of the sequence of similar stimuli on paired-associate learning.** *Acta Psychologica; Amsterdam*, 1970(Jun), Vol. 32(3), 290-300.—2 independent groups of 20 Ss practiced a list of tone-word pairs by the anticipation method—Group I (C-R) under the clustering of similar stimuli and Group II (R-R) under the random sequence—to an incomplete criterion. Practice was resumed by the 2 groups following a brief intermission and carried on to the finish under random sequence. Group C-R exhibited superior performance before but inferior performance after the intermission in comparison with Group R-R, suggesting a facilitative influence of clustering upon immediate performance but an opposite effect upon learning. Alternative interpretations using the concepts of psychological refractory state and reactive inhibition in the context of current theories of paired-associate learning are discussed.—*Journal abstract.*

1705. Gaudry, Eric & Spielberger, Charles D. (U. Melbourne, Victoria, Australia) **Anxiety and intelligence in paired-associate learning.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 386-391.—Investigated the effects of anxiety and intelligence on paired-associate learning in a factorial design with 2 levels of anxiety and 2 levels of intelligence. Ss were 72 undergraduates, 17-26 yr. old. Latency measures were obtained over 15 anticipation trials; separate analyses were made for early and later stages of learning. Results show that (a) early in learning, high anxiety facilitated performance for high-IQ Ss and impaired performance for low-IQ Ss relative to their low-anxiety counterparts; (b) later in learning, high anxiety tended to facilitate performance for both high- and low-IQ Ss; and (c) in both stages of learning, the performance of high-IQ Ss was superior to that of low-IQ Ss. Results are discussed in terms of C. D. Spielberger's extension of Spence-Taylor Drive Theory. (26 ref.)—*Journal abstract.*

1706. Goldman, Jacquelin. (U. Florida) **Semantic satiation in paired associates.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 235-236.—Investigated the relationships between recall and connotative meaning changes as a result of satiation in paired associates in 33 undergraduates. Connotative changes only occurred concomitantly with recall errors and then primarily on the activity factor. Scoring-method differences raise questions concerning the bipolarity assumption involved in the use of semantic differential scales usually employed to detect meaning change.—*Journal abstract.*

1707. Hannon, John; Janke, Mary, & Davison, Meredith. (California Dept. of Mental Health, Stockton State Hosp.) **Stimulus compounding vs social reinforcement in adult paired-associate learning.** *Psy-*

chonomic Science, 1970(Aug), Vol. 20(4), 239-240.—Tested 28 adults in a paired-associate learning task using the method of anticipation, each S learning 4 lists of 8 nonsense-syllable/adjective pairs under 4 counterbalanced conditions. 1 list was accompanied by item-specific color and flicker, another by nonitem-specific color and flicker. Still another list was accompanied by neither color nor flicker, but S was socially reinforced after each correct response. The 4th list did not involve color, flicker, or reinforcement. Item-specific color and flicker facilitated learning; the other 3 conditions did not differ reliably.—*Journal abstract.*

1708. Hatano, Giyoo & Kuhara, Keiko. (U. Tokyo, Japan) [Experimental studies of meaningful learning: II. Meaningfulness and retroactive inhibition.] *Japanese Journal of Psychology*, 1970(Feb), Vol. 40(6), 304-309.—Examined how the retroactive inhibition effect (RIE) is dependent on the meaningfulness of learning. 3 groups of undergraduates learned a series of 3 lists of paired-associates. Group I learned Lists 2 and 3 meaningfully; Group II learned List 2 but not List 3, and Group III learned neither. Results were as follows: (a) When the original learning was meaningful, RIE was small, (i.e., mean reduction ratio of correct responses was 5.2%). In rote learning, however, the effect was much larger, (i.e., mean reduction ratio was 53%). (b) Meaningfulness in interference learning was not related to the size of RIE.—*English summary.*

1709. Merryman, Coleman T. (Indiana U.) **Effects of strategies on associative symmetry.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5717.

1710. Reich, John W. & Alexander, Ralph A. (Arizona State U.) **Stimulus property mediation of paired-associates learning.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 213-225.—Mediational theory was extended and applied to paired-associates learning and transfer, using 80 undergraduates. Independent variables were stimulus mediational properties, prior stimulus familiarization, and sex of Ss. Stimuli varying in the number of mediating responses elicited by them (physical objects and their names) were initially paired with nonsense trigrams. Testing for transfer effects involved stimulus-trigram pairings opposite to those in the initial learning situation. Results revealed that the predicted enhancing effects for physical objects occurred in the initial learning phase. However, names of the objects were more facilitative of transfer. The implications of the results for the extended mediational theory are discussed. (25 ref.)—*Author abstract.*

Reinforcement

1712. Bartol, Geoffrey H. & Duerfeldt, Pryse H. (U. Portland) **Self-reinforcing behavior: The effects of base rate and dependency.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 151-161.—Examined the effect on later self-reinforcement (SR) of SR base rate, 30% vs. 60% direct reinforcement (DR) training and low, medium, or high dependency (determined by the EPPS) in the context of a word-association task. Ss were 44 male undergraduates. Later SR rate was significantly influenced by SR base rate and DR training but not by dependency level. (24 ref.)—*Author abstract.*

1713. Eisenberger, Robert. (U. California, Riverside) **Is there a deprivation-satiation function for social**

approval? *Psychological Bulletin*, 1970(Oct), Vol. 74(4), 255-275.—Examines the replicability and interpretation of J. L. Gewirtz and D. M. Baer's findings that the reinforcement efficacy of social approval increases with prior deprivation of approval and decreases with prior satiation of approval. These results were successfully replicated in an impressive number of studies using choice measures of instrumental performance. While studies employing rate or duration measures have yielded weak and inconsistent effects, methodological deficiencies in these studies make their interpretation highly equivocal. Experimental evidence suggests that changes in approval-contingent performance resulting from deprivation-satiation operations are not attributable simply to changes in general sensory deprivation, general drive level, or cue properties of approval comments. Therefore, the view that the withholding and presentation of approval alter the motivation for obtaining approval is supported. (57 ref.)—*Journal abstract*.

1714. Kelly, J. F. & Hake, D. F. (Southern Illinois U.) **An extinction-induced increase in an aggressive response with humans.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 153-164.—9 14-18 yr. old students pulled a knob on a schedule of monetary reinforcement. Concurrently, Ss escaped or avoided periodic presentations of a tone by pressing a button that required 1.5 lb. (6.67 N) of force or by punching a padded cushion that required 20 lb. (88.96 N) of force. The punching response was designated as an aggressive response because the force of this response together with its topography was comparable to responses of humans that deface objects and produce escape or counter aggression from other humans. It was found that button pressing was the preferred concurrent avoidance response and there were few punches. However, when the monetary reinforcer was discontinued (extinction) punching increased for 7 of the 9 Ss, but there was no consistent change in the rate of button pressing. When the punching response was replaced by another nonpreferred but nonaggressive response, neither this response nor button pressing increased during extinction. Hence, the increase in punching during extinction cannot be attributed solely to the fact that it was a concurrent or nonpreferred response.—*Journal abstract*.

MEMORY

1715. Bobrow, Samuel A. (Stanford U.) **Memory for words in sentences.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5706-5707.

1716. Foote, Russell A. & Pollio, Howard R. (U. Tennessee) **The role of associative organization in free recall under five different presentation conditions.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 205-207.—Investigated the effects of different presentation conditions on recall of lists differing in interitem associative strength (IIAS) with 121 undergraduates. Results showed the usual superiority of a highly organized list over a list having no such organization under discrete presentation conditions, but no difference in recall when Ss were allowed to deal with all items simultaneously and impose their own organization. This finding is interpreted to mean that typical discrete-item presentation conditions permit Ss to use only the most obvious organizational principles in accomplishing recall—roughly those defined by IIAS—whereas under

conditions when such restrictions are removed Ss are free to develop idiosyncratically meaningful structures and consequently show minimal differences in recall due to differences in IIAS.—*Journal abstract*.

1717. Furukawa, Yoshikazo. (Doshisha U., Kyoto, Japan) [The effect of motivation upon reminiscence.] *Japanese Journal of Psychology*, 1970(Feb), Vol. 40(6), 340-344.

1718. King, David J. & Forrester, William E. (State University Coll. New York, Oswego) **The influence of semantic and acoustic similarity on retention of short sentences.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 222-223.—Used short sentences as the learning material in retroactive-interference (RI) and proactive-interference (PI) designs. Ss were 300 undergraduates. The relative influence of acoustically and semantically similar interfering sentences in the 2 designs was studied. Significant PI but no significant RI effect was found. Both acoustically and semantically similar material interfered with retention, with the latter having a more powerful influence.—*Journal abstract*.

1719. Kitano, Eimasa. (Kanazawa Municipal Coll. of Fine & Industrial Arts, Japan) [A socio-psychological study on memory trace: The effect of attitude upon memory and its transformation.] *Japanese Journal of Psychology*, 1970(Feb), Vol. 40(6), 310-318.—5 radical and 5 conservative Ss underlined those statements out of a group of 10 with which they agreed. Later the 10 statements were memorized and tested for recall. In both groups, endorsed statements were recalled better than those not endorsed. In terms of the transformation of memory traces, substitution was most frequent for the endorsed statements, followed by omission, simplification and rationalization. For nonendorsed statements, simplification appeared most often, followed by rationalization, omission, and substitution. (29 ref.)—*English summary*.

1720. LeMay, Ernest H. (State University Coll. New York, Plattsburgh) **Effects of degree of interpolated learning on the recall of first-list responses at two retention intervals.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 251-252.—Investigated the effects of degree of interpolated learning (IL) on the retention of the responses in paired-associate learning with 120 undergraduates. There were 8 groups formed from the factorial arrangement of 2 retention intervals (immediate and 24 hr.) and of 4 levels of number of IL trials (0, 2, 4, and 6). Results show that in the immediate-recall condition response recall was poorest when IL was present, although degree of IL was not significant. There was no effect of IL trials when the retention interval was at 24 hr.—*Journal abstract*.

1721. Malloy, Thomas E. (U. New Mexico) **The effects of concept learning on stimulus selection in recognition memory.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5716.

1722. Marshall, Philip H. (U. Illinois) **Stimulus and response influences on recognition.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 238-239.—Presented visually clear and degraded items to 48 undergraduates to test the hypotheses that: (a) items clear on original presentation would be recognized better than items degraded on original presentation, and (b) increasing the number of sensory modalities used during both presentation and test increases recognition capability. Some support for the degradation hypothesis was obtained. Increasing the number of modalities significantly improved recognition.—*Journal abstract*.

1723. **Phye, Gary & Baller, William.** (Iowa State U.) **Verbal retention as a function of the informativeness and delay of informative feedback: A replication.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 380-381.—In a replication of P. T. Sturges' (see PA, Vol. 43:4789) study, undergraduates learned course-related material, were given an initial retention test, and received information feedback under 1 of 3 answer conditions: no distractors, 3 distractors, or 7 distractors. Informative feedback was either immediate or given after 48 hr. Retention was measured either immediately after informative feedback presentation or after 7 days. Insufficient support was found for the assertion that increase in knowledge of alternatives within the delayed informative feedback condition results in better retention performance over time.—*Journal abstract.*

Short Term & Immediate Memory

1724. **Craik, Fergus I. & Levy, Betty A.** (Birkbeck Coll., London, England) **Semantic and acoustic information in primary memory.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 77-82.—Although it is widely believed that verbal items are coded in primary memory (PM) in an acoustic or articulatory fashion, there is some evidence to indicate that PM may be a flexible system using the most salient characteristics of stored items. The possibility that semantic-associative attributes could facilitate free recall from PM was explored with 85 undergraduates. Clusters of 6 words, related either acoustically or semantically, were placed in the middle or at the end of free recall lists. From Ss' recall scores, pure PM functions were calculated for acoustic, semantic, and control lists. It was found that while both acoustic and semantic similarity facilitated total recall, this facilitation was limited to secondary memory (SM). Recall from PM was poorer for semantic than for control words; it is suggested that Ss sometimes retrieved semantic clusters from SM, even though the clusters occupied terminal list positions. (18 ref.)—*Journal abstract.*

1725. **Dornič, Stanislav & Halmiová, Oľga.** (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Recognition in short term memory: Effect of stimulus colour.** *Studia Psychologica*, 1970, Vol. 12(1), 83-85.

1726. **Furukawa, Yoshikazu.** (Doshisha U., Kyoto, Japan) [Reminiscence phenomena in printing task: Reminiscence on recall and printing performance.] *Japanese Journal of Psychology*, 1970(Apr), Vol. 41(1), 1-8.—8 groups of Ss practiced a printing task for 5 min. without rest, and then, after a 15-sec, 2-, 5-, or 8-min rest, received a recall test or 5 retrials. Reminiscence in recall appeared at 2 min., while reminiscence in printing performance occurred equally in all rest conditions. It was found that the recall and retrials immediately after the original practice interfered with the decrease of errors during retrials. Results are discussed from the viewpoints of inhibition and consolidation theories. (19 ref.)—*English abstract.*

1727. **Jelenková, Alena.** (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Serial position effect in visual and auditory span of immediate memory.** *Studia Psychologica*, 1970, Vol. 12(1), 46-50.—Attempted to ascertain whether the lower span of immediate visual memory, with successively presented stimuli, becomes manifested uniformly in the recall of the whole series of stimuli. Results of the

experiment, involving messages consisting of 5, 7, and 9 digits presented both visually and acoustically to 30 20-25 yr. old high school and college graduates, confirmed the expected lower span for visual stimuli. The serial position effect with the worst recall in the middle of the message appeared only in the acoustic variant; in the visual variant, performance in recall systematically declined from beginning to end of the message, the greatest difference in performance in both variants being with stimuli from the end of the message. Results are due to the unequal resistance of the primary and secondary verbal (originally visual) trace to interference from the recall process. (Czech & Russian summaries)—*Journal abstract.*

1728. **Karten, Steven & Berenberg, Martin.** (City Coll., City U. New York) **The effect of distraction on the retention of task-related material.** *Graduate Research in Education & Related Disciplines*, 1968(Win), Vol. 4(1), 38-53.—Tested the hypotheses that: (a) "low-interference-prone Ss will recall more task-relevant material . . . , while high-interference-prone Ss will show the reverse trend"; (b) "under distracting . . . conditions, task performance will be poorer for" all Ss; and (c) "under distracting conditions, low-interference-prone Ss will retain more relevant task material than high-interference-prone Ss, while high-interference Ss will retain more irrelevant task material, while under non-distracting conditions the reverse will be true." Results from 40 male graduate students confirmed the 2nd hypothesis but did not confirm the 1st and 3rd hypotheses. (27 ref.)—*G. Steele.*

1729. **Klein, Michael.** (U. Texas) **Similarity and directionality in the short-term memory of paired associates.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5713.

1730. **Liu, In-Mao & Ma, Hsen-Hsing.** (National Taiwan U., Taipei) **On the nature of a training trial in verbal learning.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 126-127.—Factorially combined interval of stimulus availability (1, 2, or 4 sec.), number of exposures (1, 2, or 4), and retention interval (3, 9, or 27 sec.) in a short-term memory study where verbal items were consonant trigrams. 24 female undergraduates counted backward during the 6-sec inter-exposure interval as well as during the retention interval. Results show that as the number of exposures increased, the retention curve became flatter. The interexposure interval allowed forgetting to occur, but in addition appeared to facilitate retrieval. Hence, the role of the interexposure interval may have to be considered in the definition of a training trial in verbal learning.—*Journal abstract.*

1731. **McNicol, D.** (U. Adelaide, South Australia) **Progressive decay of the memory trace.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 196.—Studied effects of delay on recall of material in short-term memory by presenting a sequence of items and requiring ordered recall either immediately after presentation or after 1½ min. Ss were 20 undergraduates. Although the total number of errors made did not increase significantly as a result of delay, errors concerned with the ordering of the items were evident even when the material was recalled immediately, but these were replaced by errors concerned with the selection of items themselves when recall was delayed.—*Journal abstract.*

1732. **Ornstein, Peter A.** (Princeton U.) **Role of prior-list organization in a free recall transfer task.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 32-37.—Failure to find positive transfer in

part-whole free recall tasks has been attributed to the irrelevance of List 1 subjective memory units (S-units) for List 2 learning. If this is so, then positive transfer should occur when List 1 S-units are relevant for List 2 learning. In Exp. I with 84 undergraduates, blocked presentation of old and new items facilitated retention of List 1 S-units and positive transfer occurred. In Exp. II with 60 Ss, alternative categorizations of polysemous words were used to manipulate the relationship between S-units of List 1 and 2. Positive transfer occurred only when the critical words were organized identically on the 2 lists. Results are consistent with an organizational view of free recall transfer data.—*Journal abstract.*

1733. Robinson, James P. (U. Southern California) **Effects of verbal and imaginal learning on recognition, free recall, and aided recall tests.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 115-117.—In 2 experiments, 48 and 85 undergraduates, respectively, were instructed to learn line drawings either by naming each one or by encoding an image of it, and were then given 1 of 3 kinds of retention tests. Namers consistently performed better than imaginers. Postexperimental reports indicate that at the time of the retention tests, namers could remember names for more stimuli than imaginers, so the learning instructions appeared to have their intended effect. Both namers and imaginers performed better on stimuli whose names they remembered than on other stimuli. In 1 experiment, namers performed better than imaginers on stimuli whose names were not remembered, suggesting that even unsuccessful attempts to remember names for stimuli can facilitate retention of the stimuli.—*Journal abstract.*

1734. Starr, B. James; Harris, Gilbert J., & Aronoff, Robert. (Howard U.) **Variable length consonant stimuli in a "Peterson & Peterson" short-term memory paradigm.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 243-244.—Tested the effects of stimulus length, interpolated task interval, and rehearsal on recall in the L. R. Peterson and M. J. Peterson short-term memory paradigm. All 3 main effects, but none of the interactions attained significance. Ss were 36 undergraduates. The superiority of self-initiated as opposed to E-paced rehearsal was suggested as was the increased necessity for any type of rehearsal as stimulus length increased.—*Journal abstract.*

1735. Turnage, Thomas W. (U. Maryland) **Proactive inhibition of initial items in short-term recall.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 236-237.—Investigated short-term recall of serial lists as a function of item frequency and prior testing with 72 undergraduates. Results suggest that: (a) interference from prior testing was obtained for initial items in the list but not terminal items, and (b) frequency had no effect on recall because the experimental method equated item availability across that dimension.—*Journal abstract.*

1736. Weeks, Robert & Katz, Leonard. (U. Connecticut) **Similarity in short-term recall: A comparison of Type II operating characteristics and percent recalled.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 232-233.—Examined the effects of semantic and acoustic similarity in short-term memory employing a retroactive inhibition (RI) paradigm. Ss were 8 groups of 11-16 undergraduates. In assessing similarity effects, signal-detection measures, Type II operating characteristics, were utilized in addition to percent recalled; the former suggested that both semantic and acoustic similarity between original learning (OL) and inter-

polated learning were important in affecting recall, while the latter revealed no effects of similarity. Results suggest that memory traces for similar and dissimilar OL items are equal in strength but that noise (due to RI) was stronger for the similar conditions.—*Journal abstract.*

1737. Winograd, Eugene. (Emory U.) **Effect of knowledge of set size on search termination in long-term memory.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 225.—20 undergraduates listed all the states whose names began with the letter "M" or "N." 1 group was told how many state names belonged to each set, while the other group was not told. The informed group worked at the task twice as long as the uninformed group and retrieved significantly more state names. Results are related to the problem of specifying quitting rules in recall.—*Journal abstract.*

THINKING

1738. Goldstein, George S. (Denison U.) **Load variables in information processing.** *Psychological Record*, 1970(Spr), Vol. 20(2), 235-242.—Investigated the effects of presentation rate, number of stimulus channels, and length of stimulus runs on an operator's information processing accuracy. 30 male graduates and undergraduates responded to visual stimuli by depressing a pushbutton. Stimuli were combinations of 4 shapes and 3 colors presented at rates of 1, 1.25, and 1.50 sec/stimuli. The stimuli were presented on 2 or 4 channels and the runs consisted of 25, 50, and 100 successive stimuli. S is conceptualized as an information channel in which the central mediating processes of encoding and decoding are the principal operations in information processing.—*Journal abstract.*

1739. Legrenzi, Paolo. (U. Padua, Psychological Inst., Italy) **Aspetti psicologici della negazione, della disgiunzione e dell'implicazione.** [Psychological aspects of negation, disjunction and implication.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1970(Mar), Vol. 31(2), 170-188.—Presents a logical analysis of "if p, then q as not being equivalent in natural thinking to the syntactic linkage" it is not possible for p = q.—L. L'Abate.

1740. McDill, James D. (U. Southern Mississippi) **Analysis of the errors, accuracy, and time required to recognize items within contextual language as a function of word class and position within the sentence.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5431.

1741. Parrott, George L. (Michigan State U.) **The effects of instructions, transfer, and content on reasoning time.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5720-5721.

Problem Solving

1743. Denney, Nancy W. (U. Washington) **Analysis of processing time for conjunctive and disjunctive problem solving.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 197-199.—Compared latencies and S-paced post-feedback intervals (PFIs) on positive- and negative-instance trials with 80 undergraduates. Neither PFI nor latency varied as a function of the type of instance.

However, a comparison of PFIs and latencies on correct and incorrect response trials indicated that both PFIs and latencies were longer on error trials than on correct response trials. It is concluded that more information processing occurred on error trials. Instructions to focus Ss on positive, negative, or positive and negative instances had negligible effects on performance.—*Journal abstract.*

1744. Maier, Norman R. & Casselman, Gertrude G. (U. Michigan) **Locating the difficulty in insight problems: Individual and sex differences.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 103-117.—Examined whether difficult problems can be made easier by manipulating a major obstacle. Standard and supposedly simplified versions of 6 insight problems were used. 311 male and 233 female undergraduates were given 3 of the standard versions and 3 of the simplified versions. Results show that the helpful manipulations had limited value. For males, the standard versions of only 3 of the problems were significantly more difficult than the simplified versions; for females, there were differences on 3 problems (2 in the same direction as the males) but none reached significance. The problems were analyzed individually for sources of failure of the manipulation. Results suggest that a single hint cannot provide significant improvement since a problem appears to be difficult for different people for a variety of reasons. Chance factors also play a part in successful problem solving. Results also confirm earlier findings showing that hints or suggestions which seem helpful when the solution is known may serve as distractors to an individual attempting to discover the solution. Implications of the results for upgrading problem solving through training are discussed.—*Journal abstract.*

1745. Schulman, David P. (U. Kansas) **Body posture and thinking.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5698.

Concepts

1746. de Zeeuw, G. (U. Amsterdam, Netherlands) **Extensive and intensive properties of concepts.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 33-34.—Described similarity between nouns (concepts) by a distance function. 10 concrete and 10 abstract words were selected and associations were collected in 3-min free-association intervals by 24 undergraduates. Distances were then related to measurements on the concrete-abstract scale and to associations. Results are interpreted in terms of 2 aspects of the semantic space of words, intensionality and extensionality, the latter appearing to be a dominant basis for behavioral comparison of concepts.—*Journal abstract.*

1747. Lee, Dean R. (U. New Mexico) **The effects of type of rule, instructions and practice upon focusing strategies in conceptual behavior.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5715.

1748. Nahinsky, Irwin D. & Slaymaker, Frank L. (U. Missouri) **Conjunctive hypothesis sampling: A reconsideration.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 224.—Presented 90 Ss with conjunctive concept learning problems in which blank-trial stimuli were used to assess hypothesis sampling patterns. Data were analyzed to show that Ss did not sample single values randomly and independently and respond on the basis of these single values. Evidence was also presented to show that Ss do

not sample hypotheses with replacement after an error.—*Journal abstract.*

1749. Pyle, Thomas W. (U. Texas) **Sequential aspects of concept identification.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5722.

DECISION & CHOICE BEHAVIOR

1750. Fleming, Robert A. (U.S. Naval Electronics Lab. Center, San Diego, Calif.) **The processing of conflicting information in a simulated tactical decision-making task.** *Human Factors*, 1970(Aug), Vol. 12(4), 375-385.—In a simulated tactical situation, 40 naval enlisted personnel decided which 1 of 3 alternative hypotheses relating to future enemy action was the most likely to occur. The decisions involved combining probabilities from 3 independent sources to arrive at the overall probability associated with each hypothesis. In addition to specifying the hypothesis which had the highest probability, Ss also estimated this probability. The independent variable was the type of feedback given after each problem. Although the proper strategy for selecting the correct hypothesis was to multiply the probabilities, most Ss used an adding strategy. This strategy was particularly ineffective on the more difficult problems. There was a general tendency to underestimate high probabilities and to overestimate low probabilities. The effect of feedback on error rate was contingent upon the particular problem type, and probability feedback improved probability estimation.—*Journal abstract.*

1751. Fujii, Minoru. (Kansai U., Osaka, Japan) [Experimental investigations on the instantaneous judging of the number of objects: III. Time values required for judging forced by various instructions.] *Japanese Journal of Psychology*, 1969(Dec), Vol. 40(5), 242-254.—Compared the time required for adult Ss to make correct instantaneous judgments of the number of vertical lines from 1-10. Instructions were to count by 1s, 2s, 3s, and by using one's own device, (usually by dividing into subgroups or using some arithmetical operation). Results show that maximum time was required for counting by 1s, less by 2s or 3s, and minimum time when using one's own device. However, when the number of lines did not exceed 3, there were no significant differences between time values.—*English abstract.*

1752. Harris, Richard J. (U. New Mexico) **Paradox regained.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 264-266.—No interpretation of N. Howard's theory of meta-games has been offered which lessens the paradox of the 1-trial Prisoner's Dilemma (PD) game, and the theory as stated is not relevant to the iterated PD.—*Journal abstract.*

1753. Rapoport, Anatol. (U. Michigan) **Comments on "Paradox regained."** *Psychological Reports*, 1970(Feb), Vol. 26(1), 272.—If Roulette is treated as a 2-person game, the wheel has a dominating strategy that always wins, namely 0. If 0 is eliminated, the meta-strategy formulation reveals nothing new. This formulation is of interest only in the context of non-zero-sum games, particularly those where the paradoxes induced by a clash between individual and collective interests are resolved in the meta-game.—*Author abstract.*

1754. Streufert, Siegfried & Streufert, Susan C. (Purdue U.) **Effects of increasing failure and success**

on military and economic risk taking. *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 393-400. —Investigated the effect of success, failure, and time spent in decision making on the degree of military and economic risk taking. A complex experimental simulation technique was employed as the research method to permit comparison of data obtained in a more "real world-like" setting with results reported by investigators using small-scale laboratory techniques. Results from 88 undergraduates show that risk taking increases with the length of time that decision-making groups spend in working on a task. After some time, risky decision making may become concentrated in 1 decision area at a time, even though risks could be taken in more areas. Comparisons to laboratory results suggest some commonalities and differences with regard to risk-taking results. (37 ref.)—*Journal abstract*.

PHYSIOLOGICAL PSYCHOLOGY

1755. Blinkov, S. M. (Burdenko Inst. of Neurosurgery, Moscow, USSR) **O vremennykh parametrah strukturno-funktsional'nykh sootnoshenii.** [On the temporal parameters of structuro-functional relationships.] *Vestnik Akademii Meditsinskih Nauk SSSR*, 1970, Vol. 25(3), 52-55.—Defends the proposition that, without taking into account the temporal parameters of the structuro-functional relationships encountered in biology and medicine, starting from the molecular and proceeding to the macroorganismic level, it is not possible to develop a suitable understanding of these relationships. A quantitative expression of structuro-functional relationships requires a determination of their spatial and temporal characteristics.—*I. D. London*.

1756. Deshcherevskii, V. I., et al. (Inst. of Biological Physics, Pushchino, USSR) **Kolebatel'nye biologicheskie protsessy na molekulyarnom urovne.** [Oscillatory biological processes at the molecular level.] *Biofizika*, 1970, Vol. 15(2), 225-234.—Study of these processes is seen as essential to an understanding of "(a) the mechanism of enzymatic catalysis, (b) the nature of the regulatory connections in polyezymatic systems, (c) the moleculokinetic bases of biological lability, and (d) the processes leading to the emergence of spatial (morphological) organization of initially homogeneous systems."—*I. D. London*.

1757. Fomin, S. V. (Moscow State U., USSR) **Nekotorye matematicheskie problemy biologii.** [Some mathematical problems in biology.] *Biofizika*, 1970, Vol. 15(2), 344-351.—Discusses some problems mainly concerned with the biophysics of complex systems and regulatory processes including those dealing with: (a) control of complex multiparametric systems, (b) organization of memory, (c) games of automata and models of collective behavior, (d) self-organizing classification, (e) models of the processes involved in the formation and propagation of excitation, (f) mechanical and informational aspects of motor activity, and (g) probability-orientation and priming. The solution of these problems requires the application of nonstandard mathematical methods, most of which are as yet insufficiently worked out.—*I. D. London*.

1758. Frank, G. M. (Inst. of Biological Physics, Pushchino, USSR) **Kletochnye struktury i funktsiya kletki.** [Cellular structures and cellular function.] *Biofizika*, 1970, Vol. 15(2), 298-307.—Examined the mutual

influence of structural and ultrastructural organization of the cell, on the 1 hand, and the level and direction of its metabolic processes, on the other. Of significance is the presence of a unified network of submicroscopic channels and spaces, limited by membranes and joining most of the subcellular structures. Major attention is directed to the dynamics of the various subcellular structures and their transformation in correspondence with change of functional state. The structural transformation of the cells of the "so-called adjoining gland" in the insect ganglion corresponds to transition from a quiescent to an active state. Microspectral analysis and electron microscopic observations show that in the granules of several molluscs change in chemical state corresponds to transformation of structure. It is shown that after 1 hr. of mechanical stimulation a surprising transformation of the protoplasmic picture takes place in the motoneurons of the earthworm. The active mobility of mitochondria into cellular regions, requiring rapid energy supply, is described. Data are presented on the continuous pulsation of the nucleus of the cell and shows that changes in the birefringence of the nerve-fiber membrane during propagation of the nerve impulse proceed in msec. "Structural mobility" is seen as a powerful regulator of the integrative function of the cell as a whole.—*I. D. London*.

1759. Frolov, V. M. **Urovni aktivnosti fiziologicheskikh sistem.** [Levels of activity of physiological systems.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 278-281.—Analyzes the functional levels of the physiological system as the result of interaction of the system with an adequate stimulus. A generalized table of intensities of stimulatory action and the corresponding levels of activity or state of the physiological system are presented.—*I. D. London*.

1760. Goldman, Stanford. (Syracuse U.) **Aging, noise and choice.** *Perspectives in Biology & Medicine*, 1968(Fal), Vol. 12(1), 12-30.—Attempts "to throw new light on the problem of aging by exploiting ideas in the fields of random noise, choice, and dynamic stability . . . The main thesis of the paper is that the noise levels in the signals which operate the control systems of an organism increase with the passage of time. The consequences of this increase in noise level represent the phenomenon of aging."—*J. Crabbe*.

1761. Goody, William. (12 Connaught Pl., London, England) **Outside time and inside time.** *Perspectives in Biology & Medicine*, 1969(Win), Vol. 12(2), 239-253.—Defines "outside time" (public), "inside time" (personal, private), and "clock." Various biological rhythmic processes and the CNS are offered as "clocks" appropriate for the measurement of "inside time." It is proposed that increasing emphasis upon chronological accuracy of "external time" clocks has alienated man from awareness of his natural, temporal internal milieu. (16 ref.)—*J. Crabbe*.

1762. Gray, Jeffrey A. (U. Oxford, Inst. of Experimental Psychology, England) **Sodium amobarbital, the hippocampal theta rhythm, and the partial reinforcement extinction effect.** *Psychological Review*, 1970(Sep), Vol. 77(5), 465-480.—The rat's hippocampal theta rhythm shows frequency-specific correlations with behavior and reinforcement contingencies. A frequency of approximately 7.7 Hz. is seen during exploration and in response to frustrative nonreward. Amobarbital, which attenuates the behavioral effects of nonreward,

selectively raises the threshold for septal driving of the hippocampal theta rhythm at this frequency. Septal driving of hippocampal theta at 7.7 Hz. applied during extinction enhances extinction; applied during acquisition it creates a "pseudo partial reinforcement extinction effect." Blocking the theta rhythm by high-frequency septal stimulation or medial septal lesions blocks the partial reinforcement extinction effect. It is proposed that there is a septohippocampal system which mediates the behavioral effects of frustrative nonreward and punishment and that amobarbital acts on behavior by antagonizing this system. (63 ref.)—*Journal abstract*.

1763. Gross, Charles G. & Zeigler, H. Philip. (Eds.) (Harvard U.) **Readings in physiological psychology: Motivation.** New York, N.Y.: Harper & Row, 1969. x, 323 p.—Contains papers by various authors on different aspects of motivation and motivated behavior. Topics covered include hunger and thirst, reinforcement, reproductive behavior, activation and sleep, and emotion.

1764. Gross, Charles G. & Zeigler, H. Philip. (Eds.) (Harvard U.) **Readings in physiological psychology: Neurophysiology—sensory processes.** New York, N.Y.: Harper & Row, 1969. viii, 286 p.—Contains papers by various authors on physiological properties of the neuron and the role of neurophysiology in understanding sensory mechanisms. Topics covered include neurophysiological foundations, receptor mechanisms, sensory coding, and central control of sensory input.

1765. Gumener, P. I., Dadashov, R. S., Samsonova, N. I., & Chebotarev, F. M. **Metodika issledovaniya regulirovaniya tochnykh dvizhenii pri razlichnykh sostoyaniyakh organizma cheloveka s pomoshch'yu mashiny.** [A method of studying the regulation of exact movements during different states of the human organism with the aid of instrumentation.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 226-232.—Examines the problem of "quality of work performance" during various states of the organism. The method is based on the simultaneous evaluation of the organism's state—"the area of regulation"—as gauged by a complex of physiological parameters. The magnitude of the "area of regulation," which is determined by the quality of the performance, is compared with variations of the physiological functions. Results of such measurements can be utilized in the physiology of work and athletics and in engineering psychology.—*I. D. London.*

1766. Gurfinkel, V. S., Fomin, S. V., & Shtil'kin, T. I. (Inst. for Problems of Information-Transmission, Moscow, USSR) **Opreделение sustavnykh momentov pri lokomotsii.** [Determination of articular moments in locomotion.] *Biofizika*, 1970, Vol. 15(2), 380-383.—Devised a method, utilizing Lagrange's equations, for calculating the "moments of internal forces [present] in the joints" in the process of walking.—*I. D. London.*

1767. Kleitman, Nathaniel. (U. Chicago) **Implications for organization of activities.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 13-14.

1768. Kok, A. (State U., Inst. for Clinical & Industrial Psychology, Utrecht, Netherlands) **The influence of speed and interval variation of serial stimuli on physiological change.** *Acta Psychologica, Amsterdam*, 1970(Sep), Vol. 34(1), 22-38.—Studied changes in heart rate (HR), heart rate variability (HRV), blood volume pulse (BVP), respiration speed (RS), and alpha rhythm (AR) under conditions of the variation of the speed and intervals of auditory stimuli in a serial 2-choice response

task. The analysis of variance of the percentage scores revealed that the differences between the 3 speed levels, the 5 physiological variables, and also the 2nd-order interaction between the speed of presentation and the physiological variables were significant. The difference between the interval variation levels was not significant. The short-term effect of step-wise variation of the duration of intervals between successive stimuli on physiological change was also investigated and an explorative study was made of the periodic fluctuations of 3 physiological variables by applying the techniques of auto-correlation and power spectrum analysis. (17 ref.)—*Journal abstract.*

1769. Kováč, Damián & Horkovič, Gabriel. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **How to measure lateral preference: I.** *Studia Psychologica*, 1970, Vol. 12(1), 5-11.—Describes a complex method for measuring lateral preference in various systems. Well known methods of determining dominance in hands, eyes, feet, ears, etc., are outlined and substantiated. A detailed description is given of some of these methods including: measurement of the circumference and shape of the skull, ear protrusion, the toe abduction test, alternate blinking, standing and hopping on 1 leg, monoaural speech decoding in noise, and promptness in simultaneous pressing responses. (Czech & Russian summaries) (17 ref.)—*Journal abstract.*

1770. Liberman, E. A. (Inst. for Problems of Information-Transmission, Moscow, USSR) **Membrany: ionnaya pronitsaemost', vozбудimost', upravlenie.** [Membranes: Ionic permeability, excitability, regulation.] *Biofizika*, 1970, Vol. 15(2), 278-297.—Examined the mechanism underlying ionic permeability of bimolecular phospholipid membranes, and the mechanism for changing this permeability by means of an electric field. Described are: the "construction" of the penetrating ions, and a method for the reception of the carriers of different ions, including those carriers, in the presence of which the transport of ions can be directed by the electric field in the membrane. Also examined are the mechanism underlying the action of the uncouplers of oxidative phosphorylation, and a method of measuring electric potential in the membranes of the mitochondria and photophosphorylating particles. The construction of a system which can transport electrons in the mitochondrial membrane and through the phospholipid membranes is discussed. A hypothesis on the role of membranes in the cellular regulatory system is elaborated. Examined were: (a) the mechanism underlying the secretion of "quanta of acetylcholine" in synaptic transmission, and (b) a model, utilizing bimolecular phospholipid membranes, to account for the secretion and other interactions of cellular membranes.—*I. D. London.*

1771. Luria, A. R. & Artem'eva, E. Y. (Moscow State U., USSR) **O dvukh putyakh dostizheniya dostovernosti psikhologicheskogo issledovaniya.** [Two ways of achieving confidence in psychological research.] *Voprosy Psikhologii*, 1970(May), Vol. 16(3), 105-112.—In many areas of research, confidence in findings can be achieved by selecting a suitably large N. Physiological psychologists typically deal with small Ns, and the traditional method of achieving confidence does not work here. Confidence can be achieved with small Ns in cerebral lesion research by using syndrome analysis, i.e., qualitative analysis of highly correlated symptoms. A

formal analysis of this method is presented in terms of Bayesian statistics, which relates it to factor analysis. (English summary)—*L. Zusne*.

1772. Malinovskii, M. S., Simchenko, B. P., Khmelevskii, S. I., & Chërnykh, B. T. (USSR Academy of Medical Sciences, Moscow) **Strukturo-funktsional'nye zakonomernosti v organizme cheloveka v aspekto fiziko-matematicheskikh predstavlenii ob ikh anatomo-fiziologicheskom edinstve**. [Structuro-functional characteristics regularly appearing in the human organism viewed within the context of the physico-mathematical concepts of their anatomo-physiological unity.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 55-66.—Discusses several regularly appearing structuro-functional characteristics which may be disclosed in the human organism as a whole, if their anatomo-physiological unity is analyzed by means of physico-mathematical methods of research.—*I. D. London*.

1773. Manoilov, V. E. & Syromyatnikova, I. N. **O vozmozhnosti ispol'zovaniya nekotorykh vidov biologicheskoi energii dlya sozdaniya istochnikov pitaniya biotelemetricheskikh peredatchnikov fiziologicheskoi informatsii**. [On the possibility of utilizing certain forms of biological energy for the creation of power sources to service biotelemetric devices for presenting transformed biological information.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 67-69.—Examines the possibility of utilizing the heat energy of the human body and the mechanical energy of respiratory movements in order to create power sources for biotelemetry. Results of theoretical studies are presented on the determination of the power values which may be procured as a result of energy transformation. Designs are developed for the construction of such power sources. Results of several experimental studies are presented.—*I. D. London*.

1774. Molchanov, A. M. (Inst. of Biological Physics, Pushchino, USSR) **Relaksatsionnaya model' adaptatsii**. [A relaxation model of adaptation.] *Biofizika*, 1970, Vol. 15(2), 352-360.—Presents a mathematical analysis of the general properties of the adaptational process on the assumption that the latter has a biochemical basis. It is shown that there is considerable difference between the course of adaptation in an isolated system and that in a complex of systems where oscillatory kinetics may become useful. In the latter instance, a relaxation model is indicated.—*I. D. London*.

1775. Paterni, L. **Manifestazioni e basi biologiche della fatica**. [Biological manifestations and bases of fatigue.] *Difesa Sociale*, 1969(Apr.), Vol. 48(2), 9-24.—Presents a general survey of physiological conditions capable of causing fatigue, criticizing the tendency to apply the concept of pathological stress to work and fatigue.—*L. L'Abate*.

1776. Samis, H. V. (Masonic Medical Research Lab., Utica, N.Y.) **Aging: The loss of temporal organization**. *Perspectives in Biology & Medicine*, 1968(Fal), Vol. 12(1), 95-101.—Discusses the importance of biological rhythms to the health of an organism. It is suggested that the deleterious effects of age may result from increasing temporal incoordination of these rhythmic processes. "Some progressive loss of temporal organization in such a complex network of interdependent but loosely coupled oscillating processes may be a property of the system itself, and therefore occur

without 'cause' in the usual sense of the term . . ." (25 ref.)—*J. Crabbe*.

1777. Strukov, A. I. **Sovremennye predstavleniya o sootnoshenii struktury i funktsii**. [Current conceptions of the relationship between structure and function.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 3-6.—Discusses the 3 "mutually connected aspects" of the relationship between structure and function: "the technical, the scientific, and the methodological," particularly as encountered in study of the cell.—*I. D. London*.

NEUROLOGY

1778. ———. **Tsepnye neirogormonal'nye reaktsii i simpato-adrenalovaya sistema**. [Chain neurohormonal reactions and the sympatho-adrenal system.] Moscow, USSR: Nauka, 1968. 194 p.—Presents a collection of 31 articles by "physiologists, pharmacologists, and neurosurgeons," providing expositions of different aspects of neurohormonal interaction in the regulation of physiological functions, and the role of both the peripheral and the central link in the complex chain of neurohormonal reactions. The 55 years of research of A. V. Tonkikh, to whom the collection is dedicated, are reviewed.—*I. D. London*.

1779. Bassin, F. V. (Inst. of Neurology, Moscow, USSR) **O vzaimootnoshenii ucheniya o vysshei nervnoi deyatel'nosti cheloveka i psikhologii na sovremennom etape**. [On the interrelationship between the theory of human higher nervous activity and psychology at the current stage.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(1), 9-15.—Presents a historically and currently based discussion which attempts to demonstrate that the "physiological and psychological study of the higher forms of brain activity irreversibly converge on each other."—*I. D. London*.

1780. Bishop, P. O. (U. Sydney, Australia) **Central nervous system: Afferent mechanisms and perception**. *Annual Review of Physiology*, 1967, Vol. 29, 427-484.—The dynamic properties of the various afferent systems as revealed by the technique of single-unit recording are emphasized. Dynamic properties are those which relate to the coding of information as single-unit discharge patterns in the 1st-order fibers of the various systems, the transformations of the discharge patterns at successive synaptic centers, and the details of the central responses underlying the identification of stimulus quality and its location in space, and the discrimination of stimulus pattern. Only the immediate recognition and discrimination of external stimuli are considered. No attempt was made to provide an exhaustive coverage of the literature but rather to provide a more detailed account of selected contributions from 1963-1966. The main topics considered are the somatic afferent pathway, input control and pain perception, the auditory pathway, functional organization of the auditory cortex, auditory pattern and space perception, color vision, the visual pathway and pattern perception, and binocular vision. (186 ref.)—*Author abstract*.

1781. Dixon, N. F. & Jeeves, M. A. (University Coll., London, England) **The interhemispheric transfer of movement aftereffects: A comparison between acallosal and normal subjects**. *Psychonomic Science*, 1970(Aug), Vol. 20(4), 201-203.—Measured movement aftereffects induced by the viewing of rotating random

patterns for 18 normal and 3 acallosal Ss. Whereas the 2 groups did not differ in the extent to which they showed monocular and binocular movement aftereffects, interocular transfer was significantly more pronounced for normal than acallosal Ss. (23 ref.)—*Journal abstract*.

1782. Dovedova, E. L. (Inst. of the Brain, Moscow, USSR) **Raspreделение fermentnoi aktivnosti v subkлетochnykh fraktsiyakh iz razlichnykh otdelov mozga krysy, vydelenykh pri pomoshchi gradi-entnogo tsentrifugirovaniya.** [Distribution of enzymatic activity in subcellular fractions from different parts of the rat brain, isolated by graded centrifuging.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 44-47.—Studied the enzymatic activity of the mitochondrial fraction and its 5 subfractions, derived from cerebral materials (cerebral cortex, brainstem, whole brain) from 5-6 Ss and separated through differential ultracentrifuging. Differences are demonstrated in protein distribution and in the level of specific activity of cytochrome oxidase, succinate-cytochrome C-oxidoreductase, and acetylcholinesterase, contained in the mitochondrial subfractions. The findings indicate a lack of equivalence in different types of mitochondria.—*I. D. London*.

1783. Dunin-Barkovskii, V. L. (Inst. for Problems of Information-Transmission, Moscow, USSR) **Kolebaniya urovnya aktivnosti v prostykh zamknutykh neironnykh tsepyakh.** [Fluctuations of activity level in simple closed neuronal chains.] *Biofizika*, 1970, Vol. 15(2), 374-378.—Examined oscillatory schedules of activity in chains, consisting of 2 and 3 neurons. It is shown that the periods of these oscillations can exceed by several times the time constant of the neurons. This property of the model distinguishes it from other familiar models of periodic activity, in which the oscillatory period is basically determined by the temporal parameters of the neurons and by the connection between them (delay value, time constant of fatigue, etc.). A case is also analyzed where the elements of the chain are not single neurons, but neuronal pools.—*I. D. London*.

1784. Durinyan, R. A. **Strukturno-funktsional'nye osobennosti mekhanizmov izbiratel'nykh reaktsii mozga.** [Structuro-functional features of the mechanisms involved in the selective reaction of the brain.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 40-46.—Presents an analysis of different approaches to the study of the structuro-functional features of selective cerebral action. Ultrastructural and microphysiological analysis of the nerve cell and the substratum, of which it is part, points the way to further progress.—*I. D. London*.

1785. Feigenberg, I. M. (Central Inst. for Advanced Medical Training, Moscow, USSR) **O nekotorykh chertakh sovremennoi fiziologii vysshei nervnoi deyatel'nosti** [On some features characterizing contemporary physiology of higher nervous activity.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(1), 59-62.—Discusses the organization and strategy of physiological research that converges upon the psychological. Exploitation of the underlying "logic of a phenomenon" pays rich dividends even when knowledge of the "concrete physiological mechanisms behind the phenomenon" is insufficient or lacking, as demonstrated in probability models and in cybernetics.—*I. D. London*.

1786. Fuster, Joaquín M. (U. California, Medical School, Los Angeles) **Mecanismos cerebrales de la atención.** [Cerebral mechanisms of attention.] *Revista de*

Psiquiatria y Psicología Médica, 1969(Jan), Vol. 9(1), 3-15.—Discusses the history of research and the present state of knowledge concerning the cerebral mechanisms of attention. It is hypothesized that the exchange of neuronal messages between the thalamus and the cortex is essential to the formation of a focus of sensory attention. The motivational states of the organism, originating in the limbic system, modify it, while the aroused state of the brainstem reticular formation is essential to its existence. In contrast to sensory attention, the locus of ideational attention lies in the frontal lobes, specifically in the interactive nature of the exchange of neuronal messages between the cortex and the diffuse thalamic projection system. (20 ref.)—*L. Zusne*.

1787. Golikov, S. N. & Kuznetsov, S. G. (Inst. of Toxicology, Leningrad, USSR) **Sovremennye predstavleniya o prirode kholinoretseptora.** [Contemporary conceptions of the nature of the cholinoreceptors.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(2), 67-85.—Presents a survey of the literature, covering the following problem areas of cholinoreceptors: (a) a localization, (b) chemical nature, (c) isolation, (d) character of their reaction to sensitive agents, (e) structure of their active part, and (f) their distribution in the postsynaptic membrane.—*I. D. London*.

1788. Hobson, J. Allan. (Harvard Medical School, Boston, Mass.) **Sleep research and basic neurophysiology.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 1-12.

1789. Kamzolkina, N. B. & Kanchurin, A. Kh. (Research Inst. of Epidemiology & Microbiology, Moscow, USSR) **Nekotorye aspekty patogeneza eksperimental'nogo allergicheskogo entsefalomielita i nevrita v kul'turakh nervnoi tkani.** [Several aspects of the pathogenesis of experimental allergic encephalomyelitis and neuritis in nerve tissue cultures.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 289-294.—Presents a survey of the Soviet and non-Soviet literature. (46 ref.)—*I. D. London*.

1790. Klosovskii, B. N. & Kosmarskaya, E. N. (Inst. of Pediatrics, Moscow, USSR) **K voprosu o sootnoshenii struktury i funktsii v razvivayushchemsya i zreloom mozgu.** [On the interrelation of structure and function in the developing, and in the mature, brain.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 46-52.—Presents an analysis of the intimate relationships between morphological structure, biochemical composition, and functions obtaining in the nervous system as a whole or in any of its macro- or micro-components in embryo- and postembryogenesis.—*I. D. London*.

1791. Kostandov, Ė. A. (Central Research Inst. of Forensic Psychiatry, Moscow, USSR) **Ob izuchenii subsensornykh reaktsii.** [On the study of subsensory reactions.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(1), 53-59.—Based on a wide range of data, discusses subsensory reactions in order to demonstrate the potentialities of methods involving the physiological and psychological study of the subject. It is shown that subsensory reactions are a function of the interrelational state of the cerebral cortex and the subcortical non-specific structures. Thus, on changing the functional state of the cortex or reticular formation, either an increase or decrease in the number of subsensory reactions occurs. Similarly, perceived stimuli may be transformed into unperceived stimuli with a con-

comitantly recorded subthreshold effect. Conversely, unperceived subsensory stimuli may be transformed into perceived stimuli. "Emotional excitation" supplies 1 of the conditions for the detection of subsensory reactions. Thus, the subthreshold action of words, connected with the negative emotion of a subject, may be demonstrated. A hypothesis is proposed to account for this action by postulating a CR mechanism. Experimental confirmation is supplied for the view that the problems dealing with the determination of signal-detection threshold or word-recognition threshold, and subsensory reactions are 2 sides of 1 general problem. It is held that the problem of the unconscious can yield to experimental research and physiological analysis.—*I. D. London.*

1792. Lange, K. A. (USSR Academy of Sciences, Div. of Physiology, Leningrad, USSR) **Nekotorye aktual'nye voprosy planirovaniya nauchnykh issledovanii v oblasti fiziologii vyssheĭ nervnoi deyatel'nosti.** [Some high-priority problems in the planning of scientific research in the field of physiology of higher nervous activity.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 184-187.—Presents historical survey of the planning efforts by the USSR Academy of Sciences in the field of the physiology of higher nervous activity (1930-1975).—*I. D. London.*

1793. Laursen, A. Mosfeldt. (U. Copenhagen, Inst. of Neurophysiology, Denmark) **Higher functions of the central nervous system.** *Annual Review of Physiology*, 1967, Vol. 29, 543-572.—Reviews studies dealing with the brain in terms of coding, information transmission, and computation. Studies with special conceptual backgrounds are not included and neurophysiology at the cellular level is considered only when directly relevant to the problem of how the brain handles information. (177 ref.).—*G. Steele.*

1794. Lissak, K. (Ed.) **Results in neurophysiology, neuroendocrinology, neuropharmacology.** Budapest, Hungary: Akademiai Kiado, 1969.—Presents a collection of articles on the neurophysiological and neuroendocrine bases of motivated behavior. The collection constitutes Volume 2 in this series.—*I. D. London.*

1795. Magazanik, L. B. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **Vliyaniye simpatomimeticheskikh aminov na desensitizatsiyu postsinapticheskoi myshechnoi membrany k deistviyu atsetilkholina.** [Influence of sympathomimetic amines on desensitization of the postsynaptic muscle membrane to the action of acetylcholine.] *Fiziologicheskii Zhurnal SSSR*, 1969(Sep), Vol. 55(9), 1147-1155.—Isolated frog muscle materials (m. sartorius and m. extensor longus dig. IV) were utilized in an extra- and intracellular microelectrode study of the influence of the sympathomimetic amines (SMAs) (noradrenaline, adrenaline, isopropylnoradrenaline) on endplate sensitivity to the depolarizing action of acetylcholine. The SMAs ($5 \cdot 10^{-7}$ - $1 \cdot 10^{-4}$ M) did not change the amplitude and form of the depolarized responses to microapplication of acetylcholine to the endplate. The SMA-evoked decrease in the velocity of desensitization could have been prevented by phentolamine (an alpha adrenolytic), but not by propranolol (a beta adrenolytic). This effect of the SMAs was evidently mediated through adrenoreceptors of the alpha type. The data suggest that neither desensitization of postsynaptic membrane to acetylcholine by the SMAs nor SMA action is connected directly with changes in the cholinoreceptors of the endplates. These effects are viewed as depending on the extrareceptor links of the postsynaptic

mechanism. (English summary) (25 ref.).—*I. D. London.*

1796. Narikashvili, S. P. (Inst. of Physiology, Tbilisi, USSR) **Assotsiativnaya oblast' kory bol'shikh polusharii golovnogo mozga i ee vzaimodeistvie s senzornymi zonami.** [The associative area of the cerebral cortex and its interaction with the sensory zones.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 110-123.—Presents a critical survey of the current level of knowledge.—*I. 1806. Valenstein, Elliot S., Cox, Verne C., & Kakolevski, Jan W. (Fels Research Inst., Yellow Springs, O.) **Hypothalamic motivational systems: Fixed or plastic neural circuits?** *Science*, 1969(Mar), Vol. 163(3871),

1084.—Defends the hypothesis that "the relationship between the activation of hypothalamic neural circuits and stimulus-bound behavior is plastic." An alternative explanation presented by R. A. Wise, who holds that the neural circuits are fixed and functionally isolated from each other, is answered by noting key differences in methodology between the 2 approaches. Questions concerning current level, threshold values, and timing of stimulus presentation are reviewed. It is concluded that the hypothesis favoring plastic rather than fixed circuits remains the more valid explanation.—*P. McMillan.*

1807. Walter, R. D. (U. California, Medical School, Div. of Neurology, Los Angeles) **Historical note: Osler's brain.** *Bulletin of the Los Angeles Neurological Societies*, 1970(Jul), Vol. 35(3), 107-110.—Sir William Osler, who was interested in cerebral topography, bequeathed his brain to the Anthropological Society of Philadelphia for study by the newly founded Wistar Institute. Osler's brain was studied along with those of a number of other notables, including Joseph and Philip Leidy, William Pepper, James Tyson, Harrison Allen, E. S. Morse, W. W. Keen, G. Stanley Hall, and J. S. Haldane. Henry Donaldson prepared the report on Osler's specimen. Donaldson was interested primarily in comparing the brains of 3 scholars—Hall, Osler, and Morse—with the brains of 3 members of the Southard family—Elmer Southard, a Harvard Medical School professor, and his parents. Donaldson concluded "from the data on hand... the scholars (Hall and Morse) had brains that were somewhat better grown and therefore better nourished than those with which they are here compared (Osler and the Southards) and that this favorable nutritional adjustment constitutes a fundamental condition favoring superior performance. For further inference adequate data are lacking."—*I. N. Mensh.*

1808. Yurkov, N. N. **O kolichestvennoi otsenke tonusa ven mozga po dannym orbital'noi pletizmografii.** [On the quantitative evaluation of cerebrovenous tone according to the data of orbital plethysmography.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 191-195.—Pressure (20-30 mm. Hg) on the neck was used to bring on cerebrovascular dilatation, which is picked up in the orbital plethysmogram, in 40 20-40 yr. old Ss. A parallelism was established between the vascular reaction to the pressure and the reactions to other stimuli. Data suggest that a possible reflex reaction of the cerebral vessels to mechanical stimulation of the sinocarotid zone exists—a reaction which should be taken into consideration when applying the method used in this study for the evaluation of cerebrovenous tone. (English summary)—*I. D. London.*

Neuroanatomy

1809. Corballis, M.C. & Beale, I.L. (McGill U., Montreal, Quebec, Canada) **Bilateral symmetry and behavior.** *Psychological Review*, 1970(Sep), Vol. 77(5), 451-464.—Defined 2 tests of the ability to distinguish left from right: mirror-image stimulus discrimination and left-right response differentiation. A perfectly bilaterally symmetrical machine could perform neither test. Evidence is reviewed that animals and men find both tests difficult, especially the 1st. It is suggested that interhemispheric fiber systems, i.e., the corpus callosum, act to "symmetrize" memory traces and thus preserve structural symmetry. This may partly explain findings of mirror-image reversal accompanying interhemispheric

transfer. Evidence is also described which suggests that animals may sometimes solve problems of mirror-image stimulus discrimination by adopting asymmetrical postures or by making asymmetrical responses in scanning the stimuli. (63 ref.)—*Journal abstract*.

1810. Hallag, Issa Y. (Kirksville Osteopathic Hosp., Mo.) **Neuroanatomic pathways associated with emotions.** *Journal of the American Osteopathic Association*, 1969(Mar), Vol. 68(7), 719-726.—Reviews the peripheral, thalamic, and central theories of emotion. J. W. Papez's proposed mechanism of emotion is presented and discussed in terms of more recent neuroanatomic and neurophysiologic investigation. The neuroanatomically related systems are reviewed in relationship to the rhinencephalon midbrain circuitry. The significant role of the subcortical and cortical connections must be considered with the reticular system in the mechanism of emotion, in addition to the rhinencephalon. These structures are essential for expression of both the subjective and objective components of emotion. It is concluded that action and interaction of the Papez circuit with the more recently recognized related neuroanatomic pathways are essential for the completion of the emotive process on a neural basis. (28 ref.)—*Journal summary*.

1811. Mel'man, E. P., Maslennikova, L. D., & Atamanchuk, E. I. (Medical Inst., Ivano-Frankov, USSR) **Opyt matematicheskogo analiza kapillyarno-neirokletochnykh otnoshenii v vegetativnykh uzlakh kishchechnika.** [An experiment in the mathematical analysis of the capillary-neurocellular relationships in intestinal autonomic ganglia.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(2), 56-62.—120 central duodenal preparations, derived from 52 cats, were used in a mathematical analysis of nerve cell-capillary characteristics in the autonomic ganglia of the intermuscular plexus of the duodenum. It was shown that the density of the capillary bed around the neuron is a function of the size and shape of its body, and the number of its outgoing processes. Given equality or near-equality of size of the neuron, the greater the number of these processes, the denser the capillary network and, hence, the richer the blood supply. This morphological relationship may be taken as an indicator of neuronal "performance-intensity" and functional significance.—*J. D. London*.

1812. Robiner, I. S. (Inst. of the Brain, Moscow, USSR) **Kortikal'naya proektsiya yader intralaminiarnoi gruppy zritel'nogo bugra koshki i ikh funktsional'noe znachenie.** [Cortical projection of the intralaminar nuclei of the cat thalamus and their functional significance.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 124-133.—19 Ss were used in an experimental-morphological study of the cortical connections of the thalamic intralaminar nuclei (electrolytic nuclear extirpation with subsequent staining of preparations) in combination with an electrophysiological study, using 13 Ss, with strychninization of these nuclei, their electrical stimulation, and observation of Ss behavior. The data provide evidence that the parafascicular nuclei are not projected onto the cortex, while other intralaminar nuclei (the central lateral and paracentral nuclei) have a definite zone of cortical representation. The cortical projection of the central lateral nucleus of the thalamus is located chiefly in the area of the suprasylvian gyrus (anterior and middle) and,

to a less marked degree, is found in the lateral orbital gyrus and in the medial hemispheric wall (geniculate gyrus and rostral limbic cortex), i.e., in those regions which are primarily the projection zone of the paracentral nuclei. The view is expressed that, owing to the specific nature of their anatomic connections and functional features, the intralaminar nuclei constitute a kind of pulsating system, serving to regulate the passage and distribution of impulses in the cerebrum.—*J. D. London*.

1813. Winkelmann, E. (Humboldt U., Berlin, E. Germany) **Moderne morphologische und funktionelle Ergebnisse auf dem Gebiet der Endausbreitung des vegetativen Nervensystems.** [Modern morphological and functional results in the field of terminal branching of the autonomic nervous system.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Apr), Vol. 22(4), 121-132.—Based on an extensive survey of the literature, it is reported that electron microscope research has decided in favor of the neuron theory rather than the terminal reticulum theory, and has also brought substantial progress in the clarification of the structure of the terminal branching of the autonomic nervous system. A separation is said to always exist between the nerve fiber of the peripheral autonomic nervous system and the organ responding to nerve stimulation. In the terminal branching it is further possible to distinguish between a uniformly structured preterminal section and a terminal section. The preterminal section is composed of axons incorporated in the cells of Schwann. In the terminal section the axons gradually come out from the Schwann cell covering to approach the effector organ. (167 ref.)—*K. J. Hartman*.

LESIONS

1814. Black, Stephen L. & Stricker, Edward M. (McMaster U., Hamilton, Ontario, Canada) **Drinking by anuric rats in excess of apparent need.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 867-871.—Found that nephrectomized and ureterally ligated male albino rats drink in excess of apparent body fluid requirements as measured by external water exchange and by depression of plasma sodium concentration. The nature of the stimulus initiating this behavior is obscure. A renal hormone is unlikely to be a primary cause of the drinking because fluid intakes of nephrectomized and ureterally ligated rats do not differ. While anuric Ss are hypovolemic, this stimulus may not entirely account for the observed drinking response. Instead, the increased plasma concentrations of urea and potassium observed may cause drinking through cerebral dehydration and consequent shrinkage of hypothalamic osmoreceptors, despite hydration elsewhere in the body, because these substances penetrate the blood-brain barrier with difficulty. Alternatively, the drinking may be in response to the accumulation of toxic substances during anuria and may function to dilute them. Whatever the cause of drinking, results suggest that anuric rats are inappropriate Ss for many experiments on thirst, unless the duration of anuria is brief. (31 ref.)—*Journal abstract*.

1815. Dafny, Nachum & Feldman, Shaul. (California Inst. of Technology) **Single cell activity in the hypothalamus in intact and adrenalectomized rats.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 873-878.—Studied the spontaneous activity of single cells and their responsiveness to sensory stimuli in the

anterior-tuberal and posterior hypothalamus in intact and adrenalectomized male Wistar rats, under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS, and particularly the hypothalamus, are discussed.—*Journal abstract.*

1816. Gannushkina, I. V. & Bakhitova, L. M. (Inst. of Neurology, Moscow, USSR) **Zavisimost' kharaktera i stepeni porazheniya nervnykh kletok v klinovidnom yadre retikulyarnoi formatsii srednego mozga ot osobennosti ikh krovosnabzheniya.** [The character and degree of nerve cell lesion in nucleus cuneatus of the mesencephalic reticular formation as a function of the features characterizing their blood supply.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(2), 115-117.—560 somatochromes in nucleus cuneatus of the mesencephalic reticular formation, derived from 10 cats whose quadrigeminal artery had been ligatured to produce focal softening in the region of that nucleus, were studied. The severest changes occurred in the large nerve cells which are rich in chromatin; the least in the group of small and medium cells with normally less developed blood supply.—*I. D. London.*

1817. Hempel, Franklin G. (U. Texas) **Visually evoked potentials from the laser-irradiated rabbit retina.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5664.

1818. Leshner, Alan I. (Rutgers State U.) **The adrenals and activity.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5715.

1819. Vorob'eva, N. M. (Research Inst. of Physiology, Kiev, USSR) **Puti peredachi vliyaniya s retseptorov dvenadtsatipervstnoi kishki na motoriku tolstogo kishechnika.** [Pathways for transmission of duodenal receptor action on the motor activity of the large intestine.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 13-16.—Ss were 4 dogs with duodenal and large intestinal fistulae. The vagus, splanchnic, and pelvic nerves, along with the bowel, were sectioned at the level of the ileocecal sphincter, in order to disclose the significance of each of them. The data provide evidence that the influences from the duodenal mechano- and chemoreceptors on the motor activity of the large intestine are mediated through the external nerves of the gastrointestinal tract (splanchnic, vagus, pelvic) and through an intramural mechanism, located in the intestinal walls.—*I. D. London.*

Brain Lesions

1820. Budakova, N. N. & Shik, M. L. (Moscow State U., USSR) **Vliyanie razdrasheniya oblasti mozgovogo stvola, vyzvayushchego khod'bu, na voskhodyashchie refleksy u mezentsefalicheskoi koshki.** [Influence of stimulation of the brainstem region; evoking locomotion, on the ascending reflexes in the mesencephalic cat.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 7-11.—Ss were curarized mesencephalic cats. Recordings were made of the responses of the deep radial nerve to stimulation of afferent fibers in the hind extremity. Ascending reflexes exhibited a 10-17 msec. latent period. Stimulation of the indicated region of the brainstem led to enhancement of the ascending reflexes and diminution of their latent periods. These reflexes in a number of instances were not

accompanied by a segmental reflex. It is, accordingly, thought that stimulation of the "locomotor region" of the midbrain produces a coordinated change in the state of different interneuronal systems of the spinal cord and not merely a diffuse facilitation of the motoneurons. Enhancement of the ascending reflexes and diminution of their latent period were also observed when changing over from frequency of afferent stimulation of once in 2 sec. to twice in 1 sec.—*I. D. London.*

1821. Gambaryan, L. S. (Armenian Academy of Sciences, Lab. of Neurobionics, Erevan, USSR) **Dvigatel'nye uslovnye refleksy pri povrezhdenii piramidnogo trakta i medial'noi petli.** [Motor conditioned reflexes after lesion of the pyramidal tract and medial lemniscus.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 48-54.—5 dogs and 30 cats were Ss in a study of the influence of isolated and combined lesions of the pyramidal tracts and lemniscal pathways on local motor CRs (electrodefensive CRs to bell in dogs; motor-alimentary CRs to bell in cats; lesion of the pyramids in dogs in the region of medulla oblongata; electrolytic extirpation of the pyramids and medial lemniscus in cats). Neither unilateral nor bilateral lesion of the pyramids and medial lemniscus excluded the possibility of elaborating and executing motor CRs. With isolated lesion of the pyramids, no signs of spastic paralysis were disclosed. It is demonstrated electrophysiologically that, with bilateral lesion of the lemniscal pathways, proprioceptive impulsion continues to arrive in the cerebral cortex. It is concluded, on the basis of the data procured and the results of clinical and experimental research by others, that the "syndrome of pyramidal paralysis" is not connected with isolated lesion of the "corticospinal (pyramidal) tract."—*I. D. London.*

1822. Glass, Jay D. & Thomas, Garth J. (U. Rochester, Center for Brain Research) **Effects of cortical ablations upon recovery from the septal syndrome in hooded rats.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 879-882.—Produced hyperreactivity of the septal syndrome in 23 adult male hooded Long-Evans rats by electrolytic lesions in the septal region. Various groups of Ss with septal lesions were handled postoperatively for either 5 or 18 days or left unhandled for 18 days. 9 operated controls were also not handled. Following handling periods, the septal syndrome declined in both handled groups, and Ss were at normal reactivity levels. The unhandled group with septal lesions still displayed the syndrome. Neocortical ablations did not reinstate the syndrome in either handled group nor change the reactivity level of unhandled groups. The septal syndrome in another group of Ss was reduced to normal levels by handling for 21 postoperative days. Spreading depression, induced by application of 25% KCl to the neocortex, did not reinstate the septal syndrome. Results differ from and restrict the generality of previous findings.—*Journal abstract.*

1823. Hamilton, Leonard W. (Rutgers State U.) **Behavioral effects of unilateral and bilateral septal lesions in rats.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 855-859.—Unilateral and bilateral septal lesions in 42 male albino Sprague-Dawley and Holtzman rats produced: (a) impaired reversal of a T-maze position habit, (b) changes in water consummatory behavior following deprivation, and (c) enhanced shuttle-box avoidance responding. Ss with unilateral lesions were

superior to those with bilateral lesions in acquiring the avoidance response, but were intermediate to controls and Ss with bilateral lesions on the reversal task. Brain mechanisms which could account for these data are discussed.—*Journal abstract.*

1824. Iontov, A. S. & Granstrem, E. E. (Inst. of Physiology, Leningrad, USSR) **Korkovye slukhovye volokna v sostave zritel' nogo trakta.** [Cortical auditory fibers are part of the visual tract.] *Doklady Akademii Nauk SSSR*, 1970, 192(4), 930-933.—Auditory areas A1, A2, or Ep were extirpated in cats by Woolsey's method. 4-9 days later Ss were sacrificed, their brains fixed in formalin, and stained. Longitudinal sections were obtained through the ipsilateral visual tract between the optic chiasma and the geniculate body. While extirpation of A1 did not lead to degeneration in the visual tract, extirpation of Ep and especially of A2 did. Degenerated axons from neurons in these areas were found along the entire length of the visual tract examined, including the geniculate bodies.—*L. Zusne.*

1825. Ishihara, Shizuko & Hattori, Yuriko. [The effect of cortical lesions on behavioral variability as measured in the multiple choice situation.] *Japanese Journal of Psychology*, 1970(Apr), Vol. 41(1), 40-44.

1826. Jinnai, Densosuke, et al. (Osaka U., Medical School, Japan) **Effect of brain-stem lesions on metrazol-induced seizures in cats.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 404-411.—Studied the chronic effect of bilaterally paired lesions in the cat's brainstem on metrazol-induced seizures to clarify the intracerebral mechanism for the maintenance of epileptic excitability. Results indicate that there are 2 systems of facilitatory and inhibitory functions in the brain-stem rostral to the pons as far as metrazol-induced seizure activity is concerned. The facilitatory system consists of the caudal mesencephalon extending rostrally to the posterior hypothalamus through the ventral part of the rostral mesencephalon and posterior subthalamus, and of the mediodorsal nucleus of the thalamus. The inhibitory system consists of the dorsal part of the rostral mesencephalon extending rostrally to the thalamus and also of the anterior hypothalamus. It is suggested that this facilitatory system plays a significant role in the onset and generalization of the metrazol seizure. (French summary) (34 ref.)—*Journal summary.*

1827. Kesner, Raymond P. & Vredenburg, Edric W. (U. Utah) **Effects of midbrain reticular lesions upon the orienting response in the rat.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 170-174.—30 male hooded rats with bilateral lesions in the midbrain reticular formation (MRF) showed no differences in the acquisition and extinction of a runway response in comparison to sham-operated controls. However, Ss with MRF lesions showed a significant decrease in the duration of an orienting response (exploratory behavior) to a novel stimulus and showed no recovery of the orienting response the next day. No differences were found in rate of habituation to the novel stimulus.—*Journal abstract.*

1828. Koopowitz, Harold. (U. California, Irvine) **Feeding behaviour and the role of the brain in the polyclad flatworm, Planocera gilchristi.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 31-35.—The feeding behavior consists of a complex sequence of events. Flatworms feed by capturing snails and extracting the molluscs from their shells. Decerebration of the flat-

worms affects both the sequential timing of the patterns and the ability to capture prey but brainless animals are still capable of feeding.—*Journal summary.*

1829. Liles, Samuel L. & Davis, George D. (Louisiana State U., Medical Center, New Orleans) **Athetoid and choreiform hyperkinesias produced by caudate lesions in the cat.** *Science*, 1969(Apr), Vol. 164(3876), 195-197.—In an experiment with 12 adult cats, it was found that small, unilateral lesions, which damage exclusively the anteroventral region of the caudate nucleus, produce a stable and permanent behavioral change resembling human athetoid and choreiform hyperkinesias. These symptoms are not seen after generalized destruction of the caudate nucleus.—*Journal abstract.*

1830. Mancía, Mauro. (U. Milan, Lab. of Human Physiology, Italy) **Electrophysiological and behavioural changes owing to splitting of the brain-stem in cats.** *Electroencephalography & Clinical Neurophysiology*, 1969(Nov), Vol. 27(5), 487-502.—A midline pontine split induced a persistent alteration of sleep-wakefulness rhythms in 30 cats. Wakefulness remained high (78.9%). These changes lasted 3-5 wk. after the splitting procedure. A midline bulbar split did not cause any consistent change in the sleep-wakefulness cycle. A mesencephalic split significantly reduced the amount of desynchronized sleep while synchronized sleep was not modified. Marked alterations in behavior, together with a marked loss of body weight, were observed in Ss with severe sleep deprivation induced by pontine splitting. The retrograde changes in the aspecific brainstem neurons brought about by midline and bilateral pontine splits suggest that the persistent increase in wakefulness and reduction of sleep, induced by these cuts, may be ascribed to suppression or reduction of the flow of physiological sleep impulses originating in regions at the level of the pontine section or caudally to them, and ascending contralaterally to diencephalic and cortical regions. (French summary) (38 ref.)—*Journal summary.*

1831. Morgan, John M. (Kansas State U.) **The effects of limbic lesions on a free operant avoidance schedule in rats.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5717-5718.

1832. Notermans, S. L. & Boonstra, S. (State U. Hosp., Groningen, Netherlands) **Electroencephalographic findings in experimentally induced intracranial hypertension.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 337-345.—Examines the relationship between the EEG and the changes in cerebro-spinal fluid (CSF) pressure in 26 cats with unilateral cerebral cortical lesions produced by extradural application of cold probe. There were no obvious correlations between alterations in the intraventricular pressure and the EEG. No clear relationship between the extent of the cerebral edema and EEG changes was found. Cooling caused EEG abnormalities. At the beginning of cerebral herniation the EEG showed gross abnormalities; about 5 min. before the respiratory arrest, general slowing of the EEG and reduction of voltage were observed. In most cases the EEG became isoelectric as soon as respiration stopped. After starting artificial respiration electrical activity reappeared after 5-150 sec. (French summary) (43 ref.)—*Journal summary.*

1833. Powers, Alice S. (Bryn Mawr Coll.) **The role of the avian hyperstriatum in habit reversal.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5721.

1834. Smith, Allan M. (Inst. of Neurophysiology & Psychophysiology, Marseille, France) **Deficits in conditioned movement and visual discrimination following rubral area lesions in the rat.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 893-898.—Bilateral electrolytic lesions in the region of the red nucleus impaired the ability of 15 Royal Victoria Hospital hooded rats to perform a conditioned avoidance response. The deficit implies a failure to initiate conditioned movement rather than direct impairment of motor organization or ability to learn. 8 Ss of the same group trained to perform simultaneous black-white and stripe discriminations showed deficits only in the acquisition of the stripe discrimination. Exp. II found that 10 Ss with rubral area lesions showed impaired learning and slower running speed in a food motivated successive brightness discrimination task. Exp. III found that 8 Ss with rubral area lesions were significantly slower to initiate movement on both pre- and postshock days in 1-trial passive avoidance training. (16 ref.)—*Journal abstract*.

1835. Strominger, Norman L. (Union U., Albany Medical School, N.Y.) **Localization of sound in space after unilateral and bilateral ablation of auditory cortex.** *Experimental Neurology*, 1969(Dec), Vol. 25(4), 521-533.—Trained 7 cats to localize sound in space in a 2-choice food-reward situation. Localizing ability was tested at angles from 90-5° and a threshold angle, where Ss scored 75% correct responses, was determined. 6 Ss were deprived of auditory cortex unilaterally. The smallest lesion involved auditory areas I and II, the posterior extosylvian gyrus, and the insular-temporal region, while the largest lesions included these plus somatic area II and the anterior and middle parts of the suprasylvian gyrus. 5 Ss had different degrees of deficit. 1 S with an ablation of all cortical areas listed above except the suprasylvian gyrus, was unimpaired. Most discrimination errors were committed when the sound was on the side contralateral to the lesion. Symmetrical ablations later were produced in the opposite cortex of 4 Ss. 1 S was deprived of auditory cortex bilaterally in a single operation. The only S with all the regions ablated bilaterally was completely unable to localize sounds; the others discriminated above chance at 90°. (52 ref.)—*Journal abstract*.

1836. Van Hoesen, Gary W. (Kansas State U.) **An analysis of two-bar ratio performance following septal lesions in rats.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5727.

Brain Hypothalamic & Hippocampal Lesions

1837. Glickman, Stephen E., Higgins, Thomas J., & Isaacson, Robert L. (U. California, Berkeley) **Some effects of hippocampal lesions on the behavior of Mongolian gerbils.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 931-938.—Subjected 28 adult male gerbils to 1 of 3 surgical procedures: aspiration of the hippocampus and overlying cortex, aspiration of the cortex overlying the hippocampus alone, or a sham operation. Hippocampal lesions increased the frequency of certain home cage behavior patterns (locomotion, rearing, sniffing, and drinking), decreased the frequency of other patterns (sleeping/lying and shredding of nest materials), and left unchanged a 3rd set of measures (alert inactivity, grooming and burrowing). In cases where increments in occurrence of a given behavior were observed, there were

lesion-induced shifts in frequency of initiation of certain behavior patterns (locomotion and sniffing) rather than in the duration of those patterns. This finding argues against a simple preservation view of the increment in frequency of these patterns. Lesion effects on reactivity to novel stimulation varied with the test procedure. Locomotor activity in an open field was enhanced, manipulatory and biting contacts with novel stimulus objects were reduced, and social reactions to 16 unfamiliar male and female visitor Ss were relatively unaffected. (27 ref.)—*Journal abstract*.

1838. Mikhailov, V. V., Astaf'eva, N. G., & Solov'eva, V. Ya. (Medical Inst., Saratov, USSR) **Ob uchastii zadnikh yader gipotalamusa v mekhanizme razvitiya eksperimental'nogo allergicheskogo entsefalomielita i postdifteriino polinevrita.** [On the participation of the posterior hypothalamic nuclei in the mechanism involved in the development of experimental allergic encephalomyelitis and postdiphtheritic polyneuritis.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(2), 32-35.—Ss were 311 guinea pigs with and without electrolytic destruction of the posterior hypothalamic nuclei. For Ss subjected to sublethal doses of diphtheritic toxin or immunized by an encephalitogenic mixture, the development of paralysis of the skeletal muscles was preceded by changes in the functional activity of the hypothalamo-hypophyseal-adrenal system, manifested by disturbances in the osmoregulatory reflexes and by the accumulation of antinerve antibodies in the blood. With electrolytic destruction of the posterior hypothalamic nuclei or with pharmacological exclusion of the adrenergic structures there—by administering appropriate doses of the adrenergic agents aminazine (chlorpromazine) or reserpine—Ss preserved adequate osmoregulatory reflexes to hydration, while the synthesis of antinerve antibodies decreased markedly. When this happened, Ss developed paralysis of the skeletal muscles 4-5 days later and survived 6-7 days longer as compared to controls.—*I. D. London*.

1839. Sanwald, Judith C., Porzio, Nancy R., Deane, George E., & Donovick, Peter J. (State U. New York, Binghamton) **The effects of septal and dorsal hippocampal lesions on the cardiac component of the orienting response.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 883-888.—Examined the effects of septal and dorsal hippocampal lesions on the cardiac component of the rat's orienting response (OR) to auditory stimulation. 13 control, 18 septal and 8 hippocampal male albino Sprague-Dawley rats all showed deceleratory responses, maximal at 2 sec. following onset, to a 1000-Hz tone. With repeated presentations of the tone controls deceleratory ORs disappeared, and a longer latency acceleratory response followed stimulus onset. Septal and hippocampal Ss failed to show this evidence of habituation to the 1000-Hz tone. Subsequent presentations of a 1375-Hz tone resulted in deceleratory ORs in all groups. Controls' ORs again habituated with repeated presentations of the stimulus, being replaced by a longer latency acceleration; septal Ss continued to make ORs throughout the series. Hippocampal Ss' deceleratory ORs to the 2nd tone did habituate; but neither they nor septal Ss showed the longer latency acceleratory response characteristic of the later stages of habituation. Thus, resting cardiac rate differences between septal and control Ss were shown to be a function of the severity of imposed restraint. Thus, in Exp. II, the basal heart rates of 7 septal Ss did not differ from those of 8 controls, or

from the pretone Trial I rates for Exp. I controls.

BRAIN STIMULATION

Chemical Stimulation

1840. Avery, D. D. (U. Texas, Southwestern Medical School, Dallas) **Hyperthermia induced by direct injection of carbachol in the anterior hypothalamus.** *Neuropharmacology*, 1970(Mar), Vol. 9(2), 175-178. —Microinjections of carbachol in the anterior-preoptic hypothalamic area of 16 male albino rats induced hyperthermia. The magnitude of the effect was dose dependent and the results were related to theoretical issues which arose from previous studies in which hyperthermia was associated with intraventricular injections of acetylcholine.—*Journal abstract.*

1841. Bennett, Gudrun S. & Edelman, Gerald M. (Rockefeller U., New York, N.Y.) **Amino acid incorporation into rat brain proteins during spreading cortical depression.** *Science*, 1969, Vol. 163(3865), 393-395. —Elicited unilateral spreading cortical depression by applying potassium chloride solutions to the dura of conscious, freely moving male Sprague-Dawley rats. Incorporation of ^3H -leucine into soluble cortical proteins was decreased in the depressed hemisphere relative to the control side, while soluble brainstem proteins from both sides had the same specific activity. Various subfractions of soluble cortical proteins were affected to equal degrees. (16 ref.)—*Journal abstract.*

1842. Burešová, Olga & Nadel, Lynn. (Czechoslovak Academy of Sciences, Inst. of Physiology, Prague) **Interhemispheric transfer in the rat.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 849-853. —Explored the mechanisms of interhemispheric transfer of brightness or pattern discrimination in male hooded rats, using cortical spreading depression (CSD) to achieve a functional split-brain. After monocular acquisition of the task, retrieval was tested during unilateral CSD. The savings were 70 and 38% for the primary trace (hemisphere contralateral to the open eye during initial acquisition) and secondary trace (hemisphere ipsilateral to the open eye) respectively. The secondary trace could not be improved by initial monocular overtraining. In Exp. II, extensive monocular training was preceded by lateralized acquisition of the discrimination task (using CSD) in the primary hemisphere. Retention testing (under CSD) revealed a transferred trace similar to the secondary trace seen when monocular training was not preceded by lateralized training of the primary hemisphere. Thus, monocular training activates interhemispheric write-in processes yielding transferred traces which cannot be improved either by initial monocular overtraining or by prior lateralized training of the primary hemisphere. Results were compared to previous findings indicating that several monocular training trials given with input mainly directed to the untrained hemisphere (after prior lateralized acquisition under CSD) initiate a more powerful transfer. It is suggested that comparison of the transcommissurally transferred information with direct sensory input to the untrained hemisphere is a prerequisite of efficient interhemispheric transfer.—*Journal abstract.*

1843. Carr, Laurence A. & Moore, Kenneth E. (Michigan State U.) **Norepinephrine: Release from**

brain by d-amphetamine in vivo. *Science*, 1969(Apr), Vol. 164(3877), 322-323. —After injection of H^3 -norepinephrine into the left lateral cerebral ventricle of 8 cats, the lateral and 3rd cerebral ventricles were perfused with an artificial cerebrospinal fluid. Addition of d-amphetamine to the perfusion fluid caused a significant increase in the concentration of H^3 -norepinephrine in the effluent. (20 ref.)—*Journal abstract.*

1844. Grunden, Lee R. & Marley, E. (U. Arizona, Coll. of Pharmacy) **Effects of sympathomimetic amines injected into the third cerebral ventricle in adult chickens.** *Neuropharmacology*, 1970(Mar), Vol. 9(2), 119-128. —32 unanesthetized adult Rhode Island red hens served as Ss. Catecholamines (.5 μM) produced behavioral and electrocortical sleep accompanied by hypothermia and a small decrease in EMG activity, although dopamine had minimal effects. The soporific and hypothermic effects observed were qualitatively similar to those resulting from small iv doses of catecholamines in young Ss. Equimolar doses of β -phenethylamine and dexamphetamine were ineffective while .5 μM of 5-hydroxytryptamine elicited biphasic behavioral and electrocortical effects. Saline (20 μl) did not alter behavior, electrocortical or EMG activity, but moderate elevation of core temperature was observed. Results provide additional evidence for a differential central action of sympathomimetic amines depending on their chemical structure and route of administration.—*Journal abstract.*

1845. Semiokhina, A. F. (Moscow State U., USSR) **O korkovo-podkorkovykh vzaimootnosheniyakh pri rasprostranyayushcheysya depressii neokorteksa.** [On cortico-subcortical interrelationships in spreading depression of the neocortex.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1970, Vol. 19(1), 143-148. —White rats reacted to sound in the form of myoclonic twitches (myoclonic hyperkinesia). Biopotentials were recorded from the sensorimotor and visual cortical areas, the internal geniculate body and hippocampus. Spreading depression was produced by the bilateral application of a 25% solution of KCl to the surface of the brain via extradurally implanted cannulae. Under the influence of spreading neocortical depression a sharp reduction of myoclonic twitches to the point of their complete disappearance occurred. KCl-induced spreading depression of the neocortex led to a considerable decrease in the bioelectrical activity of the subcortical structures—the result of a decrease in the tonic influence of the cortex. The degree of influence of spreading neocortical depression on the subcortical structures is a function not only of the general level of excitability of the CNS, but also of those complex morphophysiological relationships which obtain in the cerebral structures participating directly in the pathological reaction to sound.—*I. D. London.*

1846. Sepinwall, J. & Grodsky, F. S. (Hoffman-La Roche, Inc., Nutley, N.J.) **Effects of cholinergic stimulation or blockade of the rat hypothalamus on discrete-trial conflict behavior.** *Life Sciences*, 1969(Jan), Vol. 8(2, Pt. 2), 45-52. —Produced attenuation of a lever-press approach-avoidance conflict by placing either the cholinergic blocking agent atropine methyl nitrate into the ventromedial hypothalamus of 6 male hooded Long-Evans rats or the cholinergic drug carbachol into the lateral hypothalamus. Ip injection of atropine sulfate failed to attenuate the conflict responses; instead, suppression of approach responses

occurred. Ip injection of atropine methyl nitrate did not alter performance. Administration of carbachol in the ventromedial hypothalamus or peripheral injection of pilocarpine or physostigmine (eserine) produced suppression of approach and approach-avoidance responses. (17 ref.)—*Journal summary*.

Electrical Stimulation

1847. Goldstein, Robert; Hill, Shirley Y., & Templer, Donald I. (Malcolm Bliss Mental Health Center, Behavior Research Lab., St. Louis, Mo.) **Effect of food deprivation on hypothalamic self-stimulation in stimulus-bound eaters and non-eaters.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 915-918.—Previous studies concerned with the effects of food deprivation on hypothalamic self-stimulation were found inadequate for lack of discrimination between feeding and nonfeeding sites. In a study with 14 female Holtzman rats, this omission was rectified which allowed the conclusion that food deprivation selectively potentiates the rewarding properties of hypothalamic stimulation at sites from which feeding can be elicited. The existence of a postdeprivation facilitation in both eaters and noneaters reinforces the rationale for controlling this variable in studies designed to elucidate the neural substrates of consummatory behavior.—*Journal abstract*.

1848. Johnson, Roger N., Lobbell, Peter, & Levy, Ronald S. (Tufts U.) **Intracranial self-stimulation and the rapid decline of frustrative nonreward.** *Science*, 1969(May), Vol. 164(3882), 971-972.—Implanted 6 male albino Charles River rats with bipolar electrodes aimed at the lateral hypothalamus. Ss deprived of reward for a task previously rewarded behaved differently, depending on whether the reward was food or positive brain stimulation. Results indicate that unlike the relatively stable frustration effects obtained with conventional reward, frustration produced by withholding brain stimulation dissipates rapidly with time.—*Journal abstract*.

1849. Mendelson, Joseph. (Rutgers State U., Brain Research Lab.) **Self-induced drinking in rats: The qualitative identity of drive and reward systems in the lateral hypothalamus.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 925-930.—Of 9 adult naive male albino rats bearing electrodes in the drinking area of the lateral hypothalamus, 7 were found to self-stimulate at their drinking-threshold intensities only when water was available for drinking during the stimulation. The other 2 self-stimulated even in the absence of water, but at a lower rate than with water available. There was no gross anatomical difference between the locations of the electrodes in these 2 groups. Each S in the 1st group would self-stimulate in the absence of water only at current intensities which were above its drinking threshold. For these Ss the effect of drinking on reinforcement was equivalent to the effect of raising current intensity. It is suggested that this is true because drive and reward are qualitatively identical at the level of the lateral hypothalamus, representing different degrees of activation of the same neural system. (17 ref.)—*Journal abstract*.

1850. Stutz, Robert M., Butcher, Richard E., & Rossi, Ronald. (U. Cincinnati) **Stimulus properties of reinforcing brain shock.** *Science*, 1969(Mar), Vol. 163(3871), 1081-1082.—In an experiment with 12 male albino rats implanted with bipolar stimulating electrodes, it was found that Ss easily discriminated between 2 types

of subcortical brain shock which differed in reinforcing properties. However, when both stimuli were either neutral or positively reinforcing, Ss had difficulty in responding differentially. Possible implications for a theory concerning a generalized or diffuse reinforcement system are discussed.—*Journal abstract*.

1851. Swadlow, Harvey A. & Schneiderman, Neil. (U. Rochester, Center for Brain Research) **Stimulus generalization and transfer of training in rabbits conditioned to electrical stimulation of lateral geniculate nucleus.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 841-847.—Classically conditioned 21 rabbits by pairing electrical stimulation of the dorsal lateral geniculate nucleus (LGN) with peripheral electric shock as the UCS. In Exp. I, generalization and transfer of training between contralateral LGN were examined. In Exp. II, frequency generalization gradients were examined with total stimulus energy (TSE) either varied or kept constant. In Exp. I reliable eyeblink and heart rate conditioning were observed, and transfer of training, but not stimulus generalization, occurred between LGN. This transfer was specifically due to the previous conditioning. In Exp. II, response frequency of unconditioned eye openings to LGN stimulation varied as a function of stimulus frequency. In contrast, the highest response frequency for conditioned eyelid closings during generalization testing occurred at the stimulus frequency used during training, provided that TSE was kept constant; some generalization occurred to higher and lower stimulus frequencies. When frequency was varied without keeping TSE constant, the highest response rates occurred at stimulus frequencies higher than the training stimulus. (27 ref.)—*Journal abstract*.

1852. Wetzel, Mary C. (Veterans Administration Hosp., Psychology Service, Tucson, Ariz.) **The identification of self-stimulation elements for adjacent electrodes in the cat.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 899-905.—Implanted multiple adjacent metal electrodes into the region of the lateral hypothalamus in 6 adult cats. Self-stimulation rates for monophasic pulse trains were recorded for all arrangements of anode and cathode under bipolar and monopolar stimulation. Results show marked differences within tissue volumes of less than 1 mm. when rates for adjacent cathodes were compared. Over a row of electrodes, bipolar cathodal rate profiles were similar to monopolar cathodal profiles, and both tended to show higher rates for medial than for lateral loci. For the same wires, monopolar and bipolar absolute rates usually differed, and the direction of the difference was determined frequently by the position of the bipolar anode. Results are considered in terms of estimating the extent of self-stimulation input zones. (23 ref.)—*Journal abstract*.

ELECTRICAL ACTIVITY

1853. Al'tman, Ya. A. (Pavlov Inst. of Physiology, Leningrad, USSR) **Reaktsii neironov zadnego dvukholmiya koshki pri lateralizatsii ritmicheskikh zvukovykh razdrazhenii.** [Neuronal reactions in the posterior colliculi of the cat with lateralization of rhythmic acoustic stimulation.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 59-70.—Ss were narcotized in this extracellular microelectrode study. Noise signals employed were: (a) rhythmic stimulation with duration of burst of noise, 2 msec., frequency of

sequence, 20-30/sec, and duration of series, 600-700 msec.; (b) 600-700 msec. burst of noise; and (c) single short burst of noise (2 msec.). The following features of neuronal impulsion under the action of rhythmic stimulation were established: (a) a discharge sustained throughout the action of the series which, as a rule, was well synchronized with the rhythm of stimulation; (b) a decrease in detection threshold in comparison with that for a single burst of noise and continuous noise (600-700 msec.); and (c) a sharp growth in the magnitudes of the latent period of the reaction and its dispersion at threshold. These features were characteristic for neurons of both the phasic and tonic type. With lateralization of the series of clicks with the same frequency and duration of series (change in the temporal interval between binaurally presented series or change in the intensity of 1 of them), only $\frac{2}{3}$ of the neurons studied responded with changes in impulsion in response to both the 1st stimuli in the series and its subsequent part. In $\frac{1}{3}$ of the neurons, only the reaction to the subsequent part of the series underwent change, while the reaction to the 1st stimuli remained unchanged. The experimental material procured is compared with the data of psychophysical research. It is suggested that neuronal detectors of direction of displacement of the sound source exist.—*J. D. London.*

1854. Andreassi, J. L., Mayzner, M. S., Beyda, D. R., & Davidovics, S. (New York U.) **Effects of induced muscle tension upon the visual evoked potential and motor potential.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 245-247.—Recorded averaged evoked cortical potentials from over the visual and motor areas of 4 male graduate students in several experimental sessions which took place over a 4-wk period. The visual evoked potential (VEP) and motor potential (MP) were recorded under each of 4 conditions: (a) light flash alone, (b) squeezing dynamometer alone, (c) light plus squeezing, and (d) resting. VEP was of greater magnitude with muscle tension than with light alone. The MP was of greater magnitude under the squeezing plus light condition compared with squeezing alone. The enhancement effect in both types of potentials is attributed to the arousing influence of increased reticular activity.—*Journal abstract.*

1855. Beteleva, T. G. (Moscow State U., USSR) **Vliyaniye dlitel'nykh svetovykh i zvukovykh raz-drazhitel' na aktivnost' neironov lateral'nogo kolenchatogo tela krolika.** [Influence of prolonged photic and acoustic stimuli on neuronal activity in the rabbit lateral geniculate body.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 90-95.—Alert rabbits were used in a microelectrode study of neuronal activity in the lateral geniculate body in response to light flashes (80/sec) and acoustic strokes (15-95/sec): 11 neurons in intact rabbits, and 6 neurons in those with contralateral enucleation. Duration of rhythmic stimulation and of the intervals between such stimulation was 5 min. In 6 of the 11 neurons, such stimulation produced a stable change in spontaneous activity in the direction of both its increase and decrease—effects which are viewed as a tonic change in neuronal activity in the lateral geniculate body.—*J. D. London.*

1856. Czepakewski, Jan; Ekstedt, Jan, & Stålberg, Erik. (U. Uppsala, Sweden) **Oscilloscopic recording of muscle fiber action potentials: The window trigger and the delay unit.** *Electroencephalography & Clinical Neurophysiology*, 1969(Nov), Vol. 27(5), 536-539.—Deals

with some technical problems in connection with the oscilloscopic recording of single muscle fiber action potentials. The action potentials trigger the sweep of the oscilloscope to permit a fast time base and comparison of the shapes of consecutive action potentials. By means of the delay unit it is possible to record on the oscilloscope the part of the action potential appearing up to 500 μ sec. before the triggering point. With this unit is also possible to trigger the oscilloscope sweep on the fast positive-negative deflection of the action potential, thereby obtaining a steadier display than when triggering on the initial positive phase. By means of the window trigger it is possible to record action potentials of any given size. Only action potentials having a positive peak lying within 2 selected fixed limits will trigger the oscilloscope. The counter gate, which allows automatic time interval measurements only of those action potentials that are displayed on the oscilloscope, is described. (French summary)—*Journal summary.*

1857. Dubrovinskaya, N. V. (Moscow State U., USSR) **O vovlechenii v reaktsiyu neironov perednego dvukholmiya krolika.** [On involvement in the reaction of neurons in the anterior colliculus of the rabbit.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 84-89.—Alert rabbits were Ss in an extracellular micro-electrode study of the activity of the anterior collicular neurons resulting from the application of single, paired, and rhythmic photic stimuli. An inhibitory process was involved in 69% of the reactive neurons in response to a single flash. Various labilities were disclosed in these neurons in response to the action of rhythmic stimuli. Prolonged rhythmic action appears to be the condition for lability of these units.—*J. D. London.*

1858. Ekstedt, Jan; Häggqvist, Per, & Stålberg, Erik. (U. Uppsala, Sweden) **The construction of needle multi-electrodes for single fiber electromyography.** *Electroencephalography & Clinical Neurophysiology*, 1969(Nov), Vol. 27(5), 540-543.—Describes the construction of a needle multielectrode in which 14 25 μ platinum leading-off surfaces are mounted in epoxy resin in an opening in the side of an injection needle, 5-6 mm. in diameter. (French summary)—*Journal summary.*

1859. Epstein, A. & Schill, H. A. (Indiana U., Speech & Hearing Center) **Electrodermal responses and tolerance thresholds for pure tones.** *Acta Oto-Laryngologica*, 1968(Nov), Vol. 66(5), 417-432.—Presented tones varying in intensity from 70-130 db. SPL, at 4000, 1000, and 125 Hz., to 7 female 18-25 yr. old student nurses. Results indicate that amplitude of electrodermal responses increased with increased intensity and that responses at 1000 and 4000 Hz. were consistent with previously reported subjective levels of discomfort. Levels of discomfort were never reached at 125 Hz. Results suggest that amplitude of electrodermal responses may be utilized to indicate thresholds of tolerance. (German summary) (22 ref.)—*Journal abstract.*

1860. Grinyavichus, K., Gutman, A., Milyukas, V., & Milyauskas, R. (Medical Inst., Kaunas, USSR) **Dva podprotsessa v elektrokortikogramme zritel'noi kory krolika i aktivnost' neironov.** [Neuronal activity and two subprocesses in the electrocorticogram of the rabbit visual cortex.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 178-180.—Based on a study of 61 visual cortical neurons, it was shown that (a) the 2 alternating macroelectrographic subprocesses which constitute delta-activity reflect 2 momentary, short-lived cortical states, and (b) 1 of these subprocesses, distinguished by a

greater mean positive potential and a greater frequency of electrocorticogram extrema, is coincident with a greater level of neuronal excitation in the visual cortex—an excitation expressed in heightened discharge frequency and relative depolarization of the pyramidal cellular bodies.—*I. D. London.*

1861. Hartline, Peter H. & Campbell, Howard W. (U. California, San Diego) **Auditory and vibratory responses in the midbrains of snakes.** *Science*, 1969(Mar), Vol. 163(3872), 1221-1223.—Airborne sound and substrate vibration each elicit electrical responses below the surface of the tectum in species of 3 families of snakes. Tones of 50-1000 Hz. evoke responses independently of substrate vibration. Sensitivity to locally applied sound is present over much of the body surface. This sensitivity is attributed to the auditory nerve, because it is not altered by spinal section but is eliminated by destruction of the inner ear.—*Journal abstract.*

1862. Hori, Tadao; Miyashita, Akio, & Niimi, Yosuzumi. (Waseda U., Tokyo, Japan) [Influence of the sleep laboratory adaptation on the skin potential responses.] *Japanese Journal of Psychology*, 1969(Dec), Vol. 40(5), 231-241.—Investigated the psychophysiological significance of changes of spontaneous skin potential response (SPR) during sleep. 15 males were observed during 3 consecutive nights and EEGs were recorded throughout the nights. SPR frequency decreased with respect to the finger and dorsal hand, while slow wave sleep increased in duration, indicating laboratory adaptation. Decrease in SPR frequency was observed in Stages 1, 2, and parasleep, but no difference in Stage 4 was noted. The decreasing gradient of SPR frequency was more evident on the finger than on the dorsal hand. Results suggest that the spontaneous SPR during sleep, especially that on the finger, is due to cortical inhibitory and psychophysiological mechanisms. (34 ref.)—*English abstract.*

1863. Ivanov, I. S. & Simonov, P. V. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Model' povedeniya cheloveka v zamknoy sisteme upravleniya s kontrolem émo-tsional'nogo sostoyaniya.** [Model of human behavior in a closed regulatory system with control of the emotional state.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 169-171.—Discusses 2 experimental schemes, tested on 14 Ss, with induced emotional states, indexed by the GSR: a stipulated sequence of activity with a set time limit, and a game situation involving 6 geometric figures presented in random sequence. The disorganizing influence of negative emotions on task performance was demonstrated. "Positive feedback, which arises in this connection, promotes [however] the appearance of emotionally significant signals, while selectively intensifying the involuntary autonomic reactions to these signals." Feedback is useful in disclosing hidden defects in the training of an operator and in determining those elements of a control process which initiate feelings of uncertainty and anxiety in the operator.—*I. D. London.*

1864. Lehtinen, I. & Valleala, P. (U. Turku, Finland) **Thalamo-cortical recruiting responses during sleep characterized by a low voltage fast EEG.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 412-421.—During sleep characterized by a low voltage fast EEG, recruiting responses could be elicited in cats in the course of repetitive stimulation of "nonspecific" thalamus by using a stimulus strength

slightly supraliminal for recruiting responses during sleep characterized by EEG slow waves. The occurrence of recruiting responses and "sustained waves" depended on the stimulus strength and the actual state of the S. In the same S the thresholds for eliciting recruiting responses during slow-wave sleep and "sustained waves" during low voltage fast sleep and quiet wakefulness were the same. There was no remarkable difference between the latencies of the "sustained" and recruiting waves during low voltage fast sleep. During low voltage fast sleep, recruiting responses and REMs did not appear simultaneously. REMs did not start during recruiting responses. A similar relationship was found between recruiting responses and the electrical activity of the levator palpebre superioris muscles. The decrease of the tonic component of the levator EMG was often parallel with the waxing phase of the recruiting response. In the waking state also the searching eye movements and recruiting responses did not occur concurrently. It is assumed that during low voltage fast sleep in the course of continual repetitive stimulation, the temporal distribution of recruiting response groups corresponds to fluctuations of the low voltage fast sleep level. These fluctuations might indicate an occasional tendency to slow wave sleep. (French summary) (22 ref.)—*Journal summary.*

1865. Majeau, D. A. & Pleasonton, A. K. (Louisiana State U., Medical Center) **An electrode for the study of lingual sensitivity.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 440-441.—Describes simple electrodes which can be made inexpensively and with a minimal time expenditure after a short period of practice. They are used as disposable electrodes. (French summary)—*Journal summary.*

1866. Marco, L. A. & Brown, T. S. (State Psychiatric Inst., Chicago, Ill.) **Vzaimodeistvie parnykh neuronov v ventrolateral'nom talamuse koshki.** [Interaction of paired neurons in the ventrolateral thalamus of the cat.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 134-142.—For immobilized Ss under nembutal narcosis, simultaneous recordings of the activity of 2 closely located ventrolateral thalamic neurons were utilized, with the result that such neurons are functionally interconnected. Stimulation of the internal capsule and red nucleus was employed and carried out by means of bipolar tungsten electrodes. Glass micropipettes served to tap the potentials of single neurons in the ventrolateral thalamus, with spike activity recorded extracellularly and membrane potentials intracellularly. With intracellular recording of the potentials of thalamocortical relay units within the ventrolateral thalamus, as inhibitory postsynaptic potential developed, signs appeared of high-frequency activity in the other cell, whose properties were reminiscent of the reaction of Renshaw cells. Intracellular recording of the paired units showed that the sequence of events (discharge of the targeted cell, discharge of the interneuron, polarization of the targeted cell) formed a functional unit, which may be viewed as a model analogous to that described for Renshaw cells of the spinal cord. These thalamic interneurons may be viewed as nonspecific regulators of the spike activity of targeted cells, since they may elicit either their excitation or inhibition with the intervention of a mechanism involving an increase in membrane potential of the cell. The specific character of the axonal termini of the so-called inhibitory interneurons remains unclear.—*I. D. London.*

1867. Milstein, Victor. (U. Oregon, Medical School) **Implantation of sterile electrodes in chronic animals.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 442-443. —Describes a simple and rapid technique which obviates the need for soldering over a surgically exposed preparation. (French summary)—*Journal summary*.

1868. Nikhaenko, P. A., et al. **K primeneniyu kompensatsionnykh usilitelei postoyannogo toka tipov F-359, F-115/V-3 i samopistsev N-372, N-320-5 v issledovaniyakh v biologii i meditsine.** [On the application of compensatory amplifiers of direct current of the types: F-359, F-115/V-3 and the application of self-recorders N-372, N-320-5 in research in biology and medicine.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 270-272.—Examines the application of various amplifiers for recording low-frequency bio-potentials, changes in dermal resistance to direct current, the GSR, electrooculograms, polarized potentials of the brain and muscle, and other processes.—I. D. London.

1869. Shamrov, P. G. **Nekotorye zadachi avtomaticheskogo analiza otdel'nykh komponentov elektrentsefalogrammy i elektricheskogo potentsiala kozhli.** [Some goals of automatic analysis of separate components of the electroencephalogram and cutaneous electric potential.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 222-225.—Shows that automatic treatment of the EEG should consist of (a) finding the average integral values of analyzed frequencies for the time of the entire study, and (b) determining the deviations from the average of each frequency for microintervals of time: separately determined should be the sum of exalted and depressed oscillations for given intervals of automatic analysis of each frequency and within the limits of the separate rhythms of the EEG. Automatic analysis of the GSR should be based on procuring (a) the 1st derivative of wave step-up and down, and (b) the discrete measurement of oscillatory amplitude of electrical potential of manual skin with the limits of microintervals of time.—I. D. London.

1870. Tecce, Joseph J. & Scheff, Neil M. (Boston U., Medical Center, Div. of Psychiatry) **Attention reduction and suppressed direct-current potentials in the human brain.** *Science*, 1969(Apr), Vol. 164(3877), 331-333.—In an experiment with 18 Ss, it was found that distraction suppresses direct-current potentials (contingent negative variation) recorded from the human scalp. This reduction is accompanied by retarded RT. Contingent negative variation and RT appear to reflect a common process, attention. (20 ref.)—*Journal abstract*.

1871. Voronin, L. L. & Tanengol'ts, L. I. (Inst. of the Brain, Moscow, USSR) **Postsinapticheskie reaktsii neuronov dvigatel'noi kory bol'shogo mozga koshki na stimuly raznykh modal'nostei.** [Postsynaptic reactions of neurons in the cat cerebral cortex to stimuli of different modalities.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 71-82.—Ss were under chloralose narcosis in this microelectrode study. Recordings were made of 67 neurons (57 in the anterior sigmoid gyrus and 10 in the rostral part of the posterior sigmoid gyrus). Postsynaptic potentials (PSPs), with similar form and properties, were recorded in each of the neurons in response to all the tested stimuli. In most neurons the reaction consisted of primary excitatory PSP, followed by prolonged inhibitory PSP (100-500 msec.). In 3 cells

somesthetic stimulation produced spike-discharges, while photic and acoustic stimulation produced only sub-threshold EPSPs. IPSPs effectively inhibited "injury" discharges; with utilization of KCl-electrodes, they were converted into depolarization potentials. A significant correlation was disclosed between the values of latent periods for responses to different stimuli. On passage of current through the intracellular microelectrode, regular PSP changes were observed which were the same for reactions to all stimuli. With hyperpolarization of the membrane, EPSPs were enhanced with respect to amplitude, but with depolarization, they were diminished. The data are viewed as confirming the hypothesis that, for the motor cortex, primary convergence of signals of different modalities does not take place mainly in the cortical neurons. These signals probably arrive in the cortex along pathways which form powerful synaptic connections ending near the cellular bodies.—I. D. London.

Electroencephalography & Evoked Potentials

1874. Batuev, A. S. (Ed.) **Mekhanizmy vyzvannykh potentsialov mozga.** [Mechanisms of cerebral evoked potentials.] Leningrad, USSR: Leningrad State U., 1968. 60 p.—Presents a collection of 27 contributions to a 1968 symposium held in Leningrad.—I. D. London.

1875. Berkhout, Jan; Walter, Donald O., & Adey, W. Ross. (U. California, Brain Research Inst., Los Angeles) **Alterations of the human electroencephalogram induced by stressful verbal activity.** *Electroencephalography & Clinical Neurophysiology*, 1969(Nov), Vol. 27(5), 457-469.—Examines certain auto- and cross-spectral components of the EEG which are characteristic of responses to verbal stimuli. Employing a discriminant-analysis procedure applied to spectral parameters, it proved possible to separate subjectively stressful from nonstressful verbal stimuli, and to determine distinctive EEG responses to verbal stimuli of similar stress value differing only in semantic content. The EEG components characteristic of these response states were consistent over small populations, and the criteria developed for their identification proved valid over several different Ss without requiring individual calibration. Other, individual-specific characteristics of the EEG were observed consistently to parallel the cyclical occurrence of several constituent epochs in a 20-item question-answer sequence. (French summary) (19 ref.)—*Journal summary*.

1876. Chachava, K. V., Devdariani, M. G., & Loladze, A. S. (Research Inst. of Obstetrics & Gynecology, Tbilisi, USSR) **Nekotorye varianty normy i patologii EEG ploda.** [Several variants in the normal state and pathology of the fetal EEG.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(2), 62-66.—Presents results of research on parturitional EEGs from which considerable information can be extracted on the

functional state of the CNS of the baby being born. The EEGs during "physiological [normal] deliveries" differ from EEGs during "complicated [difficult] deliveries" and are characterized by low voltage and the absence of pathological output. In complicated deliveries the amplitude of pathological activity is higher than for normal deliveries. The pathological activity may be temporally extensive or may emerge periodically. The duration of paroxysmal discharges and the frequency of their emergence may indicate the degree of gravity of the state of the baby being born.—*I. D. London.*

1877. Doetsch, Gernot S. & Erickson, Robert P. (Duke U.) **Synaptic processing of taste-quality information in the nucleus tractus solitarius of the rat.** *Journal of Neurophysiology*, 1970(Jul), Vol. 33(4), 490-507.—Recordings from single cells in the nucleus tractus solitarius and from 1st-order fibers in the chorda tympani nerves in barbiturate-anesthetized rats were compared when a variety of chemical stimulation was presented to the anterior tongue. The responses closely resembled each other. In the nucleus tractus solitarius the average response rate was higher, the phasic response was attenuated relative to the steady state, and the neural representation of the stimulus dimension was more stable.—*G. Westheimer.*

1878. Elul, Rafael. (U. California, Brain Research Inst., Los Angeles) **Gaussian behavior of the electroencephalogram: Changes during performance of mental task.** *Science*, 1969(Apr), Vol. 164(3877), 328-331.—Investigated the probability distribution of the amplitude of scalp EEG in a normal adult in an idle state and during performance of a mental arithmetic task. Based on a large sample, the EEG of the S in the idle state follows a Gaussian (normal) probability function 66% of the time. During performance of the arithmetic task, the portion of Gaussian EEG decreases to 32%. The probability function characterizing gross EEG activity is determined by the degree of mutual interaction of individual cellular generators of wave activity in the tissue underneath the recording electrode. Data imply an increase in the cooperative activity of cortical neuronal elements during performance of a mental task. (15 ref.)—*Journal abstract.*

1879. Fairchild, M. D., Jenden, D. J., & Mickey, M. R. (Veterans Administration Hosp., Long Beach, Calif.) **Discrimination of behavioral state in the cat utilizing long-term EEG frequency analysis.** *Electroencephalography & Clinical Neurophysiology*, 1969(Nov), Vol. 27(5), 503-513.—Describes a hybrid system which makes feasible a continuous, long-term analysis of the EEG. A broad-band frequency analyzer is interfaced with a digital voltmeter which in turn drives a typewriter and card-punch machine. Data are generated in a form directly compatible with the input devices of a large, electronic computer used to extract relevant information by multivariate statistical analysis. Spontaneous variations in the frequency spectrum of the EEG, as the result of changes in behavioral state, may be adequately represented as points on a 2-dimensional surface. The reliability and stability of this technique should provide a means of quantitative assessment of drug effects on the EEG over long periods of time. (French summary) (26 ref.)—*Journal summary.*

1880. Fox, Stephen S. & Rudell, Alan P. (U. Iowa) **Operant controlled neural event: Functional independence in behavioral coding by early and late components of visual cortical evoked response in**

cats. *Journal of Neurophysiology*, 1970(Jul), Vol. 33(4), 548-561.—"Adult cats were trained with milk reinforcement to modify a late (190-213 msec) component of the flash-evoked visual cortex response in order to identify behavior-relevant aspects of the wave. Both increased negativity and increased positivity 1.2 SD [standard deviation] from a pretraining mean could be trained, and such extreme values could be maintained in a steady operant conditioned state for an indefinite period. 2 styles of response were observed by which the animals generated responses that met the criterion for reinforcement: either a positive notch or negative peak was developed at the appropriate point in time on the evoked potential, or a positive or negative increase in duration of the preceding wave and a consequent shift in latency of the late component appeared. Changes in the late wave were localized to the critical segments of the wave, with no changes appearing in other portions including the primary wave complex. Variations in the late wave associated within steady state behaviors were not attributable to changes in the primary visual path to the extent that its activity is reflected by the early waves. Such independence of evoked potential components indicates that the time-locked wave is not a unitary message but encodes a number of separate behavioral states."—*G. Westheimer.*

1881. Fruhstorfer, H. & Bergström, R. M. (U. Helsinki, Finland) **Human vigilance and auditory evoked responses.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 346-355.—In 7 normal Ss vigilance fluctuations and related changes in the auditory evoked response were quantitatively analyzed during rest lasting 10 min. (eyes open) or 80 min. (eyes closed) in a soundproof room. During a session vigilance decreased noticeably in all Ss whether the eyes were kept open or closed. With closed eyes the vigilance decrease was rapid and in most cases reached real sleep. After this initial fall vigilance increased again and remained, with smaller oscillations, at a certain level of the intermediate stages. The click-evoked response was large and stable in the alert state. No progressive changes in latency or shifts in focus were noticed. There was, however, a decrease in latency and a posterior shift in the focus of N₂ at the transition to real sleep. The progressive loss in amplitude is interpreted as a decline in the activity of certain brain functions which are essential for the maintenance of an efficient S-environment relation. (French summary) (29 ref.)—*Journal summary.*

1882. Jones, Richard H., Crowell, David H., & Kapuni, Linda E. (U. Hawaii) **A method for detecting change in a time series applied to newborn EEG.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 436-440.—Developed an autoregression model using a step-wise procedure for estimating the parameters to test for change in the poststimulus onset EEG of a single S. A stationary process is assumed for the prestimulus data and if there is no significant change, for the poststimulus region. Change can be detected at any point in the time series giving a measure of response latency and duration. This analysis was performed utilizing the responses of a human newborn to sensory stimulation to demonstrate the applicability of the model for detecting changes in digitized EEG data and relating these to underlying neurophysiological activity. (French summary)—*Journal summary.*

1883. Kalyuzhnyi, L. V. & Zakharova, I. I. (Inst. of

Medicobiological Problems, Moscow, USSR) Izmeneniya elektroëntsefalogrammy pri mezhsig-nal'nykh reaktsiyakh. [Changes in electroencephalograms during intersignal reactions.] *Zhurnal Vyssheï Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 174-177.—5 rabbits were used to study several forms of EEG manifestation of intersignal reactions in an elaborated alimentary-motor CR involving pedal-pressing for food. The CS was light flashes (5/sec); EEG recordings were from the visual cortex, dorsal hippocampus, lateral hippocampus, and medial mesencephalic reticular formation. In Ss with such CRs there appeared, in response to the signal, a burst of synchronized biopotential waves (8-10 cps) in all EEG leads, and rhythmic assimilation (driving response) in only the visual cortex and lateral hypothalamus. Certain types of EEG changes were shown to be coincident with various forms of intersignal behavioral reactions. Thus, the driving response in the intervals between signals may appear only in EEG recordings from the visual cortex, but without the accompaniment of food-procurement behavior.—*I. D. London.*

1884. **Kasamatsu, Akira & Hirai, Tomio.** (U. Tokyo, Japan) **An electroencephalographic study on the Zen meditation (Zazen).** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 205-225.—The EEG has become a reliable way to assess the state of wakefulness or sleep. Studies on EEG changes during anoxia, epileptic seizures, and exogenous brain disorders were carried out. Zazen is a sitting meditation which is a kind of religious exercise in Zen-Buddhism. Ss were 48 priests and disciples in 2 sects, ranging in age from 24-72. 22 other persons served as controls. Training in Zen meditation produces changes in both mind and body. In such meditation, the EEG pattern is slowed and the alpha block is de-habituated. (32 ref.)—*R. D. Nance.*

1885. **Legewie, H. & Probst, W.** (Max Planck Inst. for Psychiatry, Munich, W. Germany) **On-line analysis of EEG with a small computer (period-amplitude analysis).** *Electroencephalography & Clinical Neurophysiology*, 1969(Nov), Vol. 27(5), 533-535.—Describes a simple method for automatic analysis of the EEG suitable for use with the smallest digital computers presently available. The computer program suggested supplies complete period and amplitude histograms for any analysis time chosen. Applications of this flexible and economical method for clinical and scientific purposes are discussed; an illustrative example is given. (German summary)—*Journal abstract.*

1886. **Legewie, H., Simonova, O., & Creutzfeldt, O. D.** (Max Planck Inst. for Psychiatry, Munich, W. Germany) **EEG changes during performance of various tasks under open- and closed-eyed conditions.** *Electroencephalography & Clinical Neurophysiology*, 1969(Nov), Vol. 27(5), 470-479.—Obtained telemetric EEG recordings of 8 healthy persons during rest and during performance of 4 different tasks with eyes closed and of 5 tasks with eyes open. Automatic analysis of temporo-occipital and fronto-central EEG yielded the following results: (a) when the eyes were open, temporo-occipital and fronto-central alpha activity were less than when the eyes were closed; (b) fronto-central "alpha" activity was decreased during performance; (c) performance produced a significant trend toward intermediate degrees of temporo-occipital alpha activity; and (d) the increase in synchronization with eyes open was independent of

whether visual components were directly involved in the task. (German summary) (15 ref.)—*Journal summary.*

1887. **L'vov, V. A.** **Ustroïstvo dlya chteniya grafikov (elektroëntsefalogramm).** [Equipment for reading graphs (electroencephalogram).] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta.* (See PA, Vol. 45:Issue 2) 208-212.—Examines an apparatus which makes possible the simultaneous reading of the ordinates of up to 4 nonintersecting curves etched out on a strip of paper.—*I. D. London.*

1888. **Myshkin, I. Yu.** **Issledovanie svyazi mezhdru fazami dykhatel'nogo tsikla i kolebaniyami biopotentsialov kory mozga krolika.** [Investigation of the relationship between phases of the respiratory cycle and the fluctuations of cortical potentials in the rabbit.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 11-13.—15 unanesthetized Ss were used to study respiratory rhythms as a possible source of variability for evoked potentials in the visual cortex. Computer analysis revealed a relationship between the spontaneous and reactive fluctuations of biopotentials and the phases of the respiratory cycle. Observed correlations were distinguished by their inconstancy. In 90% of the observations the ratio of amplitude of biopotential fluctuations, connected with the respiratory phases, to the average summated EEG amplitude was not more than 3%. Any permanent and deeper association was normally an artifact; however, recurrent periods of brief amplification of such an association was a characteristic feature.—*I. D. London.*

1889. **Novokhatskii, A. S.** (Ukrainian Research Inst. of Eye Diseases, Kiev, USSR) **O vyzvannom svetovym razdrazheniem setchatki potentsiale gipotalamusa.** [On hypothalamic potential evoked by photic stimulation of the retina.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 96-101.—In 32 rabbits photically evoked potentials in various parts of the hypothalamus possessed a multicomponent structure and were observed most often in recordings from the supraoptic, periventricular, and mammillary nuclei. Amplitudinally the greatest evoked response was recorded from the mammillary nucleus. It arose with great rarity from the dorsomedial and ventromedial nuclei. On comparison of the latencies of the electroretinogram (ERG) and the evoked responses in the hypothalamus, it appears that, for the anterior nuclei of the latter, the latency frequently coincided with that of the ERG; in the mammillary nucleus it was greater by an average of 10 msec., while in the posterior part of the hypothalamus it was somewhat shorter. The presence of direct anatomical connections between the retina of the eye and the hypothalamus was also demonstrated with centripetal and centrifugal fibers.—*I. D. London.*

1890. **Ornitz, Edward M., Ritvo, Edward R., Tanguay, Peter E., & Walter, Richard D.** (U. California, Neuropsychiatric Inst., Los Angeles) **EEG spikes and the averaged evoked response to clicks and flashes.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 387-391.—Spontaneous bilaterally and synchronously occurring spike activity was activated by sleep in a 53-mo-old boy (with moderate mental retardation and a severe developmental delay in speech acquisition) and showed the unusual tendency to become time-locked to both clicks and flashes. Averaging of the auditory and visual evoked responses demonstrated that the summated spikes were equivalent to wave N₁ of the averaged evoked response. This finding is interpreted as

a type of recruiting response mediated by sensory modalities that utilize mechanisms common to this type of spike discharge. (French summary)—*Journal summary*.

1891. Poulos, Dennis A. & Lende, Richard A. (Albany Medical Coll., N.Y.) **Response of trigeminal ganglion neurons to thermal stimulation of oral-facial regions: I. Steady-state response.** *Journal of Neurophysiology*, 1970(Jul), Vol. 33(4), 508-517.—Squirrel monkeys were anesthetized with pentobarbital and units were recorded from the mandibular division of the 5th nerve in response to temperature changes of tongue. Most units responded only to thermal stimulation. Their impulse rates were studied in response to steady state temperature stimulation and also to adaptation to new temperatures. The rare units that responded to temperature and mechanical stimuli had somewhat different characteristics.—G. Westheimer.

1892. Poulos, Dennis A. & Lende, Richard A. (Albany Medical Coll., N.Y.) **Response of trigeminal ganglion neurons to thermal stimulation of oral-facial regions: II. Temperature change response.** *Journal of Neurophysiology*, 1970(Jul), Vol. 33(4), 518-526.—Thermal stimuli were applied to the tongue of the barbiturate-anesthetized squirrel monkey in a step-like sequence above and below a 35° C standard reference and the response of trigeminal ganglion neurons recorded. Cooling was responded to by increased phasic discharges; however, warming never produced dynamic increases, but rather transient decrease or cessation of ongoing activity.—G. Westheimer.

1893. Prior, Pamela F. & Deacon, Patricia A. (London Hosp., England) **Spontaneous sleep in healthy subjects in long-term serial electroencephalographic recordings.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 422-424.—Used visual rating scales to assess the depth and duration of drowsiness in sleep in the EEGs of 13 normal Ss taken at monthly intervals over 3 yr. There was no evidence that the EEGs or the Ss' physiological state was influenced by exposure to a placebo or to small doses of the insecticide, dieldrin, administered for 2 out of the 3 yr. However, Ss slept more frequently, more speedily and for more of the recording time as the 3 yr. period progressed. Certain characteristics of the EEG phenomena of the sleep that occurred are noted, and comparison of the basically similar wave forms of occipital "lambdoid" waves of sleep and waking lambda waves in the same individual is made. (French summary)—*Journal summary*.

1894. Ritter, Walter & Vaughan, Herbert G. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Averaged evoked responses in vigilance and discrimination: A reassessment.** *Science*, 1969(Apr), Vol. 164(3877), 326-328.—Describes a replication of an experiment by M. Haider, P. Spong, and D. B. Lindsay (see PA, Vol. 39:4136). With the use of monopolar recordings for averaged evoked responses, detected signals in a vigilance task are associated with a late positive component (LPC) which is absent for undetected signals and nonsignals. Bipolar recordings obscure the LPC associated with detected signals. Data suggest that the LPC represents cerebral processes associated with evaluation of unpredictable changes in stimulation.—*Journal abstract*.

1895. Romanovskaya, E. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **K mekhanizmu funktsional'noi perestroiki korkovogo**

kontsa dvigatel'nogo analizatora pri vyrabotke I pereklyuchenii tonicheskikh refleksov. [On the mechanism of functional adjustment of the cortical terminus of the motor analyzer during elaboration and switchover of tonic reflexes.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 212-218.—Studied, in 6 dogs, excitability of the motor cortex in response to direct electrical stimulation of the cortical representative of the motor UCR. Recordings were made of: (a) summated electrical activity of the sensorimotor cortex; (b) evoked potentials under 13-19 extradurally implanted silver electrodes, located in the region of projection of the extremity under stimulation; (c) reflex reactions of the extremity to electrodermal stimulation; (d) general motor activity; and (e) changes in respiratory amplitude and frequency. 3 series of experiments were conducted with CR switchover of tonic reflexes. Time of day (morning and evening) were the CR indicators of switchover in combination with a definite position of the S (direction of the head toward the feed trough or a 180° turn away from it). It was shown that, in the switchover process, a functional adjustment in the motor cortex occurred. Stabilization of switchover resulted in a decline in the thresholds of the motor reaction to direct stimulation of the cortical representative of the motor UCS, and electrodermal stimulation of the extremities, as well as a decline in the thresholds of evoked potential. These changes point to a functional reorganization at the site of the cortical representative of the motor UCR.—I. D. London.

1896. Shvyrkov, V. B. (Inst. of Normal & Pathological Physiology, Moscow, USSR) **Sravnitel'naya kharakteristika operezhayushchego i bezuslovnogo voz-buzhdenii v somatosenzornoj kore krolika pri vyrabotke uslovnogo oboronitel'nogo refleksa.** [Comparative characteristics of anticipatory and unconditioned excitation in the rabbit somatosensory cortex following elaboration of a defensive conditioned reflex.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 3-10.—In 15 alert Ss in this micro- and macroelectrode study, (a) a defensive CR had been elaborated, with light flashes (2-4/sec) as CS and electrostimulation of the hind paw as UCS, and (b) recordings had been made of the EEGs of different cortical areas, EMGs of the muscles of the extremities, and respiratory rate. For 10 controls, rhythmic light and electric current were presented in random order with unequal intervals of intervening time. It is concluded that in the somatosensory system of cortical neuronal reactions to the CS, an afferent model of future electrodermal reinforcement is reproduced earlier. Elaboration of the CR rendered most of the somatosensory cortical elements, which reacted to unconditioned stimulation, polysensory. The increase in the number of polysensory cortical cells after elaboration of the CR was connected with a rise in the level of their spontaneous activity.—I. D. London.

1897. Small, Joyce G. & Small, Iver F. (Larue D. Carter Memorial Hosp., Indianapolis, Ind.) **Interrelationships of evoked and slow potential responses.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 459-464.—Measured simultaneous evoked responses and DC potential changes to determine the extent to which these responses would vary with resting and response conditions and whether significant interactions could be found. Ss were 10-22-37 yr. old volunteer staff members of a neuropsychiatric hospital. Visual and auditory

stimuli were presented in a preplanned schedule to each S, who was seated in an electrically positioned chair in a sound controlled, darkened laboratory. Methodology for recording responses is detailed. Results reveal "no consistent differences between auditory and visual evoked potentials elicited with neutral as opposed to signal stimuli." However, alterations were found in slow potential activity, appearing with warning-imperative signal contingencies as compared with resting conditions. No significant relationships appeared between the "latency and amplitude measurements of the cerebral evoked responses and voltage levels of slow potential activity." (19 ref.)—P. McMillan.

1898. Sokolov, E. N., Chelidze, L. R., & Korzh, N. N. (Moscow State U., USSR) *Upravlenie s predskazaniem v dvigatel'nykh i elektroentsefalograficheskikh reaktsiyakh cheloveka*. [Control involving prediction in human motor and electroencephalographic reactions.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 83-89.—14 20-30 yr. old Ss participated in a comparative study of the occipital EEG and the EMG of the digital flexors on executing motor CRs to regularly (1-30 sec. intervals) and irregularly (randomly chosen 2-20 sec. intervals) presented flashes of light (100 microsec., 1 W.). For regularly intervalled signals, premature reactions developed in the EEG, in advance of the real action of the stimulus. With irregular light flashes (mean interval, 8 sec.), the premature reactions in the EEG and EMG, which predominated in the short intervals, were replaced by anticipatory reactions in the EEG, which emerged in the longer intervals. The latent period of the EMG reactions, which emerged directly in response to a light flash, increased with increase of the interval in both cases of signal presentation. With the irregular presentation, this feature was complicated by the prolongation of the latent periods of the EMG on sudden shortening of the interval. Participating in the shortening of the average value of the EMG latent periods were a mechanism involving prediction, and a mechanism involving sensitization. After exclusion of the predictive mechanism, the effect of sensitization remained.—I. D. London.

1899. Tagiev, Sh. K. (Inst. of Physiology, Baku, USSR) *Interotseptivnye vliyaniya na elektroentsefalogrammu zhivotnykh raznogo filogeneticheskogo urovnya*. [Interoceptive influences on the electroencephalogram of animals at different phylogenetic levels.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 149-155.—Studied the dynamics of changes in the electrical activity of the mesencephalic reticular formation (MRF), and various parts of the cerebrum, on interoceptive stimulation (intestinal mechanoreceptor stimulation via balloon expansion) in a number of vertebrates at different levels of cephalization (10 rabbits, 15 rats, 12 pigeons, 9 land turtles, 23 frogs). Electrodes were implanted in the: (a) motor and visual regions of the cerebrum and in the MRF for rabbits, rats, and pigeons; (b) surface of the middle and anterior cerebrum for turtles; and (c) region of the middle and anterior cerebrum for frogs. Interoceptive stimulation produced definite changes in the electrical activity of the cortical structures and the MRF. These changes were expressed in the form of synchronization or desynchronization of rhythms. The former appeared distinctly in rabbits; less distinctly in rats. Depression of rhythms in all leads from the brain was characteristic for pigeons, turtles, and frogs. In rabbits, rats, and pigeons (but not in

turtles and frogs) the interoceptive influence on the EEG was abolished by aminazine (chlorpromazine). The difference in aminazine action on interoceptive influence upon cerebral biocurrents is ascribed to special properties obtaining in the adrenergic substratum of the RF in the brainstem of these animals. The data provide evidence for the close functional connection of the brainstem RF with the afferent systems of the internal organs in animals at different levels of phylogenesis.—I. D. London.

1900. Teter, Darrel L. (U. Denver) **A comparison of summed cortical evoked responses and avoidance conditioned responses to pure tones in cats.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5737-5738.

1901. Thach, W. T. (National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) **Discharge of cerebellar neurons related to two maintained postures and two prompt movements: I. Nuclear cell output.** *Journal of Neurophysiology*, 1970(Jul), Vol. 33(4), 527-536.—The discharge of neurons in the dentate and the interposed nuclei of the cerebellum was recorded in alert rhesus monkeys as they maintained 2 postures and performed 2 quick movements in response to light signals. Changes in frequency—up or down—occurred before the movement in some units and after the beginning of the movement in others. During the 2 postures the discharge frequency of most cells was nearly the same but for a few cells it differed.—G. Westheimer.

1902. Thach, W. T. (National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) **Discharge of cerebellar neurons related to two maintained postures and two prompt movements: II. Purkinje cell output and input.** *Journal of Neurophysiology*, 1970(Jul), Vol. 33(4), 537-547.—Units identified as cerebellar Purkinje cells by their position and by the fact that they showed 2 kinds of spikes were recorded from alert rhesus monkeys who had been trained to maintain 2 postures and to perform 2 quick movements in response to light signals. For both kinds of spike potentials, a change in frequency could occur before or after the onset of movement and in better relation to movement in 1 direction than in the other. An increase in frequency of the complex spike could be associated with 1 of several different patterns of simple spike frequency.—G. Westheimer.

1903. Ulett, Judith A. & Itil, Turan M. (U. Missouri, Inst. of Psychiatry, St. Louis) **Quantitative electroencephalogram in smoking and smoking deprivation.** *Science*, 1969(May), Vol. 164(3882), 969-970.—Deprived 8 16-24 yr. old males who were heavy smokers of cigarettes for 24 hr. Ss showed significant changes in the EEG analyzed electronically and by digital computer. Compared to Ss' records before smoking deprivation, there was a significant increase in slow frequencies. Resumed smoking reversed these trends. Results support the contention that tobacco smoking is a complex psychosomatic problem, analogous to drug addiction.—*Journal abstract*.

1904. Val'tsev, V. B., Shevel'ev, I. A., & Lalayan, A. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Kharakteristika afferentnogo potoka, vznikayushchego v zritel'noi sisteme koshki pri vyklyucheniĭ sveta.** [Characteristics of the afferent flow arising in the cat visual system on switching off light.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 90-99.—20 wakeful and narcotized cats were

used in a study of the basic characteristics of the afferent flow, arising in various parts of the primary visual pathway upon cessation of photic stimuli (acting from 50-5000 msec.), as judged by the parameters of the primary summated evoked potentials. In wakeful cats the off-response appeared only after completion of the 1st phases of the evoked potential in response to the onset of the photic stimulus, and had a considerably higher threshold, but smaller latent period, than the on-response. The increase in amplitude of response with increase of duration of the photic stimulus was most pronounced in the lateral geniculate body and least pronounced in the retina. This relationship was revealed in the range of duration up to 5 sec. A feature of the off-response was the increase in developmental time observed in all phases of evoked potential in response to lengthening of the photic stimulus within a definite range of duration—a fact which points to the involvement of additional inhibitory mechanisms. The subsequent decrease in developmental time of all phases of evoked potential, observed in the retina, optic tract, lateral geniculate body, and visual cortex upon switching off the photic stimulus, as well as the decrease in delay of the afferent flow at each level, was taken as evidence for the synchronization of the signal, traveling the primary visual pathway.—*I. D. London.*

SENSORY PHYSIOLOGY

1905. **Blakemore, Colin & Pettigrew, John D.** (U. California, Neurosensory Lab., Berkeley) **Eye dominance in the visual cortex.** *Nature*, 1970(Jan), Vol. 225(5231), 426-429.—Presents results of neurophysiological investigations which studied the nature of the inputs from 2 eyes to the striate area of the cat. It was found that: (a) the projection from the contralateral eye dominates the cat's visual cortex, (b) binocular neurons in any small region have their receptive fields more widely scattered over the ipsilateral retina than over the contralateral, and (c) stereoscopic vision may depend on this difference in the 2 projections.—*Journal abstract.*

1906. **Frank, Robert N. & Dowling, John E.** (Johns Hopkins U., Medical School, Wilmer Inst.) **Rhodopsin photoproducts: Effects on electroretinogram sensitivity in isolated perfused rat retina.** *Science*, 1968(Aug), Vol. 161(3840), 487-489.—Exposed isolated perfused retinas of albino rats to brief saturating flashes of white light which bleached about 50% of the rhodopsin present. Transient photoproducts of the reaction could be detected for about 30 min. The b-wave threshold increased by 3 logarithmic units after the flash and remained stable at this level. Results suggest that the longer-lived intermediate products of rhodopsin photolysis do not influence scotopic visual sensitivity.—*Journal abstract.*

1907. **Fry, Glenn A.** (Ohio State U., Coll. of Optometry) **Mechanisms subserving bright and dark adaptation.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(May), Vol. 46(5), 319-338.—Presents a new way of relating W. A. Rushton's findings about the bleaching of the pigments in the rods and cones to psychophysical measurements of bright and dark adaptation. This involves a gain control mechanism for controlling the response of the rods, which is a modification of the gain control proposed by Rushton. Consideration is given to the need for postulating a separate mechanism of adaptation at a level

above the photoreceptors. The role played by the positive afterimage and inhibition in the aftereffects of stimulating the eye with light are also discussed. (31 ref.)—*Journal abstract.*

1908. **Glickstein, Mitchell.** (Brown U.) **Organization of the visual pathways.** *Science*, 1969(May), Vol. 164(3882), 917-926.—Discusses spatial organization and comparative anatomy of the visual system of mammals to provide a better understanding of structure and function in vision. Results of experimentation suggest that "the classical principle of spatial ordering of retinal projections to the striate cortex of the brain" has been upheld. In form vision, however, the accepted unique role of the visual cortex is questioned. "In some species a collicular circuit appears capable of mediating form vision, and, in some, the visual fields appear to be projected more than once onto the visual cortex." (49 ref.)—*P. McMillan.*

1909. **Hoffman, William C.** (Oakland U., Rochester, Mich.) **Higher visual perception as prolongation of the basic Lie transformation group.** *Mathematical Biosciences*, 1970, Vol. 6, 437-471.—Describes a basic Lie group, derived in an earlier study, that expressed the mathematical form of the visual constancies and primitive form memory. The group was extended via prolongation of its Lie derivatives to the complicated orbits characteristic of the contours recognizable in higher form vision. Arguments are given that the results of D. H. Hubel and T. N. Wiesel (see PA, Vol. 39:9556) on the so-called psychovisual cortex (Areas 18 and 19) constitute electrohistological correlates of these prolongations. It is further argued that perception consists of an exact sequence of prolonged Lie derivatives acting on the corresponding differential form. Physiological arguments are juxtaposed with mathematical results to demonstrate that form memory resides in the proliferation of the neuronal arborescence, to which RNA generation during protein synthesis is incidental. (32 ref.)—*Journal abstract.*

1910. **Humphiss, Deryck.** **The measurement of sensory ocular dominance and its relation to personality.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Aug), Vol. 46(8), 603-615.—Describes a method for measuring sensory retinal rivalry. By comparing the measurements of the right and left eye, a measure of dominance of 1 over the other was obtained. Dominance was then correlated with each of a battery of neuropsychological and psychological scores. Results indicate that children with normal vision have little or no sensory ocular dominance. Although dominance increases with age, in normal persons it remains small. In some a marked dominance exists, often for no ocular reason. Retinal rivalry scores relate to some form of psychological rigidity which increases with age. The nature of this remains unknown, although it would seem to be a type of perseveration.—*Journal abstract.*

1911. **Kolosova, T. E.** (Inst. of Experimental Medicine, Leningrad, USSR) **Osobennosti vzaimodeistviya odносторонnikh uslovnykh refleksov pri odnovremennom i posledovatel'nom ikh primeneni.** [Features of the interaction of unilateral conditioned reflexes with their simultaneous and successive application.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 11-17.—Unilateral CRs were elaborated in 4 dogs (with surgically exteriorized lingual regions). The sinistral CS was a bell, the UCS was a 30% solution of NaCl on left

part of tongue; the dextral CS was a metronome (120 strokes/min), and the UCS was the same solution on right part of tongue. It is shown that unilateral CSs, applied without appropriate unconditioned reinforcement for different durations of action (5 sec.-4min.), created foci of latent excitation of different intensities—foci which diverted in their direction excitation from the application of subsequent CSs acting in the other direction, both during direct substitution of the 1st signal and against the background of its action. However, discrimination of CSs under the experimental variants undertaken was possible, though masked, since excitation from the subsequent stimulus, in its diversion to the direction of the 1st, more intense focus of excitation, was subthreshold. To the degree that the action of the 2nd conditioned signal was prolonged, excitation increased and, on attaining threshold level, was manifested in the form of secretory reaction on its own side, but with a greater latent period, whose magnitude was 22-30 sec.—*I. D. London.*

1912. **Martin, Frederick N. & Blosser, Dennis.** (U. Texas) **Cross hearing: Air conduction or bone conduction.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 231.—Gave 6 unilaterally anacusic Ss pure-tone threshold tests in each ear, with and without the good ear plugged. The threshold shift produced by the plug was less for the bad than for the good ear. Since interaural attenuation was unaffected by the plug, it is concluded that cross-hearing occurs via bone conduction.—*Journal abstract.*

1913. **Ostrovskii, M. A.** (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Foto-reaktivnost' pigmentnogo epiteliya glaza.** [Photo-reactivity of the pigmented epithelium of the eye.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 110-113.—The method of "electronic paramagnetic resonance" was employed to demonstrate the appearance of free radicals in the pigmented epithelium and in the suspension of its melanoprotein granules under the action of physiological intensities of visible light. With the exclusion of light, the free radicals recombined and disappeared. The effect of reversibility was distinctly manifested—the appearance and disappearance of radicals with the repeated turning of light on and off. With illumination by visible light, photoconductivity of the pigmented epithelium was disclosed along with that of the melanoprotein granules, measured by a "noncontact method" employing a superhigh frequency (10^{10} cps)—a method that makes possible the study of the photo-semiconductive properties of a homogenic system under heterogenic conditions. With exclusion of light, the effect of conductivity disappeared. The demonstrated photo-reactivity of pigmented epithelium, together with certain features of the metabolism and structure of its cells and branchings, leads to the hypothesis that the pigmented epithelium may play a more important physiological role in the regulation and execution of the photoreceptor act in the visual cells (rod and cone) than has been supposed before.—*I. D. London.*

1914. **Wolbarsht, Myron L. & Yeandle, Stephen S.** (National Naval Medical Center, Naval Medical Research Inst., Bethesda, Md.) **Visual processes in the Limulus eye.** *Annual Review of Physiology*, 1967, Vol. 29, 513-542.—Critically reviews the current state of knowledge about the anatomy and physiology of the horseshoe crab eye, *Limulus polyphemus*. The following subjects were considered: Taxonomy and distribution, evolution, anatomy of the lateral, median, ventral, and rudimentary

eyes, and electrical responses and their origins. This latter includes the electroretinogram, the early receptor potential, the spontaneous potential fluctuations or bumps, the ommatidial potential, and the nerve impulses. The origin of each of these electrical potentials is discussed. A functional model of the eye is presented. Lateral inhibition, light and dark adaptation, polarized light sensitivity, quantum responses, visual pigments, and spectral sensitivity are also discussed. (90 ref.)—*Author abstract.*

BIOCHEMISTRY

1915. **Barratt, Ernest S., Russell, Glen; Creson, Daniel, & Tupin, Joe.** (U. Texas, Medical School, Galveston) **Neurophysiological and behavioral correlates of lithium.** *Diseases of the Nervous System*, 1970(May), Vol. 31(5), 335-337.—Reports an exploratory investigation on the effects of lithium on selected areas of the brain and on behavior as part of a larger study on impulse control. Ss included cats and normal humans. Animal studies involved stimulation of 2 brain loci (basolateral amygdala and orbito-frontal cortex) often described as regulatory centers for impulse control. Human studies involved a double-blind study of medical students who were administered lithium carbonate and a placebo. EEGs in the human Ss and evoked potentials in the cats showed similar diffuse slowing in cortical leads. The area of the brain most effected by lithium remains uncertain, although the frontal and temporal lobes had the highest concentrations of lithium after a 7-day build-up in cats, and the brainstem and cerebellum had the lowest.—*P. McMillan.*

1916. **Cahill, George F. & Owen, Oliver E.** (Harvard Medical School, Boston, Mass.) **Body fuels and starvation.** *International Psychiatry Clinics*, 1970, Vol. 7(1), 25-36.

1917. **Clark, Brian R., Rubin, Robert T., Kales, Anthony, & Poland, Russell.** (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Comparison of fluorometric method for urinary cortisol with modified Porter-Silber method for 17-OHCS.** *Clinica Chimica Acta*, 1970, Vol. 27., 364.—Analyzed 109 3-hr urine samples from 27 normal and stressed Naval aviators, and 44 consecutive 24-hr urine samples from a barbiturate addict undergoing withdrawal. Samples were analyzed by a modification of a new fluorometric method specific for serum cortisol and a modified Porter-Silber method for 17-hydroxycorticosteroid, following hydrolysis of steroid conjugates with β -glucuronidase-aryl sulfatase (calbiochem). Total cortisol values ranged between .5 and 50 $\mu\text{g}/100\text{ mL}$, and total Porter-Silber chromogens ranged between .1 and 3 $\text{mg}/100\text{ mL}$. The 28 individual correlations between these measures ranged between +.70 and +.99, and all reached the .05 level of significance. The average correlation coefficient was +.90, yielding a common variance of 81%. It appears that the fluorescence method, which eliminates interfering substances and is accurate for very low cortisol levels, may be used to reflect reliably adrenal cortical activity as ordinarily measured, by the urinary excretion of glucocorticoid metabolites.—*Journal abstract.*

1918. **DeHaven, J. C. & Shapiro, N. Z.** (RAND Corp., Santa Monica, Calif.) **Speculations on physiochemical fluid properties in physiological regulation.** *Perspectives in Biology & Medicine*, 1968(Fal), Vol. 12(1), 31-60.—The addition of relatively large amounts of

certain chemical substances to a physiological system can alter steady-state concentration gradients of other substances between various intra- and extracellular media. It is suggested that membrane properties alone may not suffice to explain these phenomena. Evidence relating to the effects of fluid properties on fluxes and concentration gradients is extensively reviewed. It is proposed that the "fundamental biochemical effect of hormones is realized through (a) their influence in altering the polar nature of specific proteins and (b) the resulting change in the bulk electrostatic characteristics of the various physiological fluids containing them." (73 ref.)—*J. Crabbe*.

1919. Faiszt, József & Adám, György. (Eötvös Lóránd U., Budapest, Hungary) **Role of different RNA fractions from the brain in transfer effect.** *Nature*, 1968(Oct), Vol. 220(5165), 367-368.—Investigated transfer phenomenon following destruction of brain RNA. The conditioning procedure entailed a defensive motor response conditioned by pairing an acoustic stimulus with an electric shock. 420 male Wistar rats were subjected to 10 experimental sessions, and 280 Ss which performed the trained response perfectly served as trained donors. Prior to receiving ip RNA injections, 420 recipient Ss were trained to perform the conditioned avoidance response without the CS. Ss were then tested in the same manner as the trained donors. Results show that Ss with pretreatment with ribosomal RNA performed significantly better in all trials than did controls. —*P. Shibelski*.

1920. Hartmann, Ernest. (Tufts U., Medical School) **The D-state and norepinephrine-dependent systems.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 308-328.

1921. Lenhoff, Howard M. (U. Miami) **Behavior, hormones, and hydra.** *Science*, 1968(Aug), Vol. 161(3840), 434-442.—Discusses the role of glutathione in activating the feeding response in *Hydra littoralis*. The mechanism of action of the glutathione receptor-effector system of hydra is also reviewed. The possible evolutionary relationships between the chemical receptors of primitive organisms and the hormone receptors of more complex organisms is discussed. And it is concluded that the "behavioral responses of a lower invertebrate to a peptide and some hormonal responses in man to peptides may have many fundamental features in common." (47 ref.)—*P. McMillan*.

1922. Zimmerman, Hyman J. (Veterans Administration Hosp., Boston, Mass.) **The spectrum of hepatotoxicity.** *Perspectives in Biology & Medicine*, 1968(Fal), Vol. 12(1), 135-161.—Attempts "to deal representatively with the enormous literature that relates to chemical hepatic injury and . . . to demonstrate that the phenomena of hepatotoxicity . . . can be arranged in a rational pattern by approaching the individual facets of mechanisms of injury, types of damage, and circumstances of exposure . . . There are 2 main mechanisms, intrinsic toxicity and host idiosyncrasy; there are 2 main forms of hepatic injury, and a mixture of the 2. These may be incurred as toxicologic, accidental phenomena, or through therapeutic misadventure . . . [It is] proposed that the phenomena can be understood as the result of the generalized membrane disruption induced by direct hepatotoxins and the pinpoint metabolic interruption of the indirect." (91 ref.)—*J. Crabbe*.

Hormones

1923. Ader, Robert. (U. Rochester, School of Medi-

cine & Dentistry) **Early experiences accelerate maturation of the 24-hour adrenocortical rhythm.** *Science*, 1969(Mar), Vol. 163(3872), 1225-1226.—Reared Charles River rats under 12-hr alternating periods of light and dark. Ss were killed at times corresponding to the times at which the maximum or minimum plasma corticosterone concentrations occur in mature Ss. The characteristic 24-hr adrenocortical rhythm was first observed in Ss 21-25 days old. In Ss handled or stimulated with electric shock, the rhythm developed as early as 16 days.—*Journal abstract*.

1924. Ader, Robert. (U. Rochester, Medical & Dental School) **The effects of early experience on the adrenocortical response to different magnitudes of stimulation.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 837-839.—Charles River rats remained unmanipulated or were handled once each day throughout the preweaning or immediate postweaning period, following which they were individually caged. At maturity plasma corticosterone levels were sampled 5, 15, 30 or 60 min. after a 60-sec exposure to a novel environment in which groups were subjected to 0, 1, 4 or 12 2-sec electric shocks. Steroid levels rose significantly in response to the novel environment but only in females was there an additional elevation in corticosterone in response to 4 and 12 shocks. Differences between handled and nonhandled Ss were unrelated to the magnitude of stimulation, but the adrenocortical reactivity of handled Ss was less than that of controls irrespective of the age at which handling had been experienced. (15 ref.)—*Journal abstract*.

1925. Beatty, Patricia A., Beatty, William W., Bowman, Robert E., & Gilchrist, Jack C. (North Dakota State U.) **The effects of ACTH, adrenalectomy and dexamethasone on the acquisition of an avoidance response in rats.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 939-944.—Describes 3 experiments with 165 male Holtzman albino rats. Exogenous elevation of circulating ACTH level facilitated the acquisition of a 2-way avoidance response at a high but not at a moderate UCS intensity. Injections of ACTH had no general effect on spontaneous shuttling activity, escape behavior to light-onset, or intertrial responding during avoidance conditioning. Adrenalectomy, which resulted in minimal plasma levels of adrenocortical hormones and, presumably, elevated levels of ACTH, also facilitated avoidance responding. Injection of dexamethasone, a synthetic glucocorticoid and ACTH inhibitor, produced severe weight loss and hypophagia, but did not influence avoidance performance. However, the failure of dexamethasone to affect acquisition of avoidance responding was not related to its effect on body weight and food intake. ACTH action on avoidance conditioning is clearly extraadrenal, but ACTH is not essential to normal performance, at least when high levels of glucocorticoids are present. (19 ref.)—*Journal abstract*.

1926. Brain, Paul F. & Nowell, Norman W. (U. Hull, England) **The effects of differential grouping on endocrine function of mature male albino mice.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 907-910.—Isolated or housed mature male albino mice of the Tuck TT strain and of proved fertility in groups of 2, 4, 8 or 16. After 21 days of such treatment, plasma samples were obtained both by rapid decapitation and via the jugular vein following 2 min. of ether stress. Body weights and weights of various endocrine glands were obtained from Ss of each category of housing. Results indicate that Ss maintained as pairs showed a more

pronounced increase in adrenocortical function and a greater decline in gonadal activity when compared with single Ss than some of the more densely crowded groups. Apart from paired Ss, there was a general increase in adrenocortical activity and a decline in gonadal function proportional to the increase in group size (as shown by J. J. Christian). Results are interpreted on the basis of the increased social stress to which the subordinate mouse is subjected. (16 ref.)—*Journal abstract*.

1927. Christenson, Carl M. (Kansas State U.) **Some factors relating to behavioral characteristics of *Microtus ochrogaster***. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5751-5752.

1928. Efremova, N. M. (USSR Academy of Sciences, Lab. of Experimental Physiology in Reanimation of the Organism, Moscow) **Funktsiya shchitovidnoi zhelezy v rannem postreanimatsionnom periode**. [Thyroid glandular function in the early period following reanimation.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(2), 23-25.—Experiments on the reanimation of 33 dogs, subjected to either 5 min. of clinical death due to blood loss (20 Ss) or 10-12 min. electrotraumatic cessation of circulation (13 Ss), showed that, if the level of protein-bound iodine declined in the 6 hr. following reanimation, reestablishment of the functions of the CNS took place. Ss dying 12-24 hr. after reanimation displayed a considerable increase in the level of protein-bound iodine in the blood.—*I. D. London*.

1929. Levine, Murray D., Gordon, Thomas P., Peterson, Rolf H., & Rose, Robert M. (U.S. Army Aberdeen Research & Development Center, Human Engineering Lab., Aberdeen Proving Ground, Md.) **Urinary 17-OHCS response of high- and low-aggressive rhesus monkeys to shock avoidance**. *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 919-924.—Hypothesized that a rhesus monkey's aggressive behavior may be predictive of his adrenal cortical response to shock avoidance. In Exp. I, the relative aggressiveness of 12 sexually mature male rhesus monkeys was estimated and Ss were exposed to 4 wk. of free operant avoidance. Urinary 17 hydroxycorticosteroid (17-OHCS) output was used as a measure of stress. Results show that the high-aggressive Ss are chronically stressed and take longer to learn the task. Low-aggressive Ss show little stress response and learn the task quickly. In Exp. II, with 11 Ss, the avoidance paradigm was altered to study the possible confounding levels between the 2 groups is chronic and stable and is not necessarily a function of either variable. The stable differences in 17-OHCS output are interpreted as being a function of the interaction of a particular type of S and a particular type of task.—*Journal abstract*.

1930. McCollom, Richard E. (Virginia Polytechnic Inst.) **Androgen threshold responses in lines selected for mating ability**. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5377.

1931. Moltz, Howard; Levin, Robert, & Leon, Michael. (Brooklyn Coll., City U. New York) **Prolactin in the postpartum rat: Synthesis and release in the absence of suckling stimulation**. *Science*, 1969(Mar), Vol. 163(3871), 1083-1084.—Postpartum female Wistar rats, deprived of suckling stimulation while being kept continuously with pups, nonetheless suspended ovarian cyclicity for an average of 16 days and responded to uterine trauma by forming deciduomata. Results show that the extramammary stimulation afforded by young is alone capable of sustaining prolactin output from the

adenohypophysis of the postpartum rat.—*Journal abstract*.

1932. Powers, J. Bradley. (U. California, Berkeley) **Hormonal control of sexual receptivity during the estrous cycle of the rat**. *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 831-835.—Investigated the effects of ovarian hormones on the display of sexual receptivity in female Sprague-Dawley rats showing 4-day estrous cycles. Acute ovariectomies were performed on the day of expected behavioral estrus, timed so that the influence of ovarian estrogen alone, or of ovarian estrogen plus progesterone could be evaluated. High levels of receptivity can be elicited only following the combined action of estrogen and progesterone. Estrogen alone is not sufficient; supplementary estradiol benzoate fails to induce estrous behavior if the facilitative action of progesterone is prevented. Biphasic effects of progesterone were not detected under the physiological conditions employed and most likely are of minimal importance in regulating the duration of behavioral estrus. Estrus duration is controlled primarily by the levels of estrogen which condition the neural substrate for lordosis during the 24-36 hr. period preceding the onset of receptivity. Exogenous estradiol benzoate added to the estrogen already secreted by the ovaries prolongs the period during which lordosis behavior can be elicited by progesterone injection. Possible contributing effects of adrenal progesterone to the control of estrous behavior were examined. (33 ref.)—*Journal abstract*.

1933. Von Euler, U. S. (Karolinska Inst., Stockholm, Sweden) **Some aspects of the mechanisms involved in adrenergic neurotransmission**. *Perspectives in Biology & Medicine*, 1968(Fal), Vol. 12(1), 79-94.—Reviews much of the present knowledge of adrenergic neurotransmission, including: (a) a description of nor-adrenaline (NA) homeostasis; (b) adrenergic nerve ending morphology; (c) properties of storage granules; (d) NA synthesis, release, and reuptake; (e) free and bound NA pools; and (f) drug actions. A schematic system for the adrenergic neurotransmission process is offered, involving receptor concepts at both granules and postsynaptic membrane, and suggesting a dynamic equilibrium between extragranular and granular stores of NA. (68 ref.)—*J. Crabbe*.

Drug Effects—Human

1934. Brown, Barbara B. (Veterans Administration Hosp., Sepulveda, Calif.) **Effect of LSD on visually evoked responses to color in visualizer and non-visualizer subjects**. *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 356-363.—The visually evoked responses (VERs) to color of visualizer Ss evidenced a significant degree of color specific characteristics and selective alteration in color specificity after LSD. Changes were more pronounced in the amplitude domain. Configuration of the VER to white and red were consistently different from those to blue or green. Visualizers also reported enhanced visual perception after LSD. In nonvisualizers the VERs to all color conditions except to red were virtually identical. Following LSD, early components of all 3 color VERs were changed in configuration, all changes being in the latency domain. Maximal amplitudes occurred in the VERs to white while counting the flashes in all Ss. After LSD this was unchanged in visualizers but was attenuated in nonvisualizers. A technique for ranking components of a complexly organized set of responses was

used which permitted extraction of critical data from a complex of intercurrent intra- and inter-S variation. The technique isolated patterns of response by which changes over time could be conveniently compared within and between S groups, and as these were affected by the experimental condition. This proved useful in isolating significant differences in a multidimensional system. (French summary) (20 ref.)—*Journal summary*.

1935. Cassell, W. A. & Hemingway, P. (Dept. of Public Health, Regina, Saskatchewan, Canada) **Body consciousness in states of pharmacological depression and arousal.** *Neuropharmacology*, 1970(Mar), Vol. 9(2), 169-173.—Administered Fisher's Body Focus Questionnaire to undergraduates. Altered levels of CNS excitation were produced by phenobarbital and caffeine citrate. Under the former conditions, it was observed that the more sedated an S felt, the more his body consciousness focused on the head. Fisher's high barrier Ss were found to be particularly sensitive to the depressant drug. With stimulation a positive relationship was found between the degree of arousal and the extent an S focused on outer and right aspects of the body. This was more prominent in the low barrier group. (21 ref.)—*Journal abstract*.

1936. Fischer, Roland. (Ohio State U., Coll. of Medicine) **Out on a (phantom) limb: Variations on a theme: Stability of body image and the golden section.** *Perspectives in Biology & Medicine*, 1969(Win), Vol. 12(2), 259-273.—In Exp. I, 24 college-age volunteers viewed a black line on a white background through a prism and reported the 1st deviation from "flatness" as the prism was counterrotated. Oral ingestion of 160-200 $\mu\text{g}/\text{kg}$ of psilocybin 110 min. prior to testing significantly reduced distortion threshold. In Exp. II, 15 similar Ss having pronounced taste sensitivity were measured by the MMPI and the Goldberg formula after ingestion of 160 $\mu\text{g}/\text{kg}$ of psilocybin; pupillary response indicated drug arousal level. All Ss were tested as in Exp. I before ingestion of drug. Autonomic arousal was unrelated to psychopathology measures while perceptual performance significantly correlated with psychopathology. Experience of a "phantom limb" is discussed as a readaptation phenomenon compensating for distortion of corporeal awareness. "Body image" was defined as a separate concept, disturbances of which are characterized by depersonalization phenomena. Psychodysleptic drugs interfere with readaptation phenomena as well as causing distortion in "body image"; the alleviation of phantom limb sensation is thus explained. Evidence is also discussed supporting esthetic preferability of the golden section as a function of the ease of readaptation to it. (65 ref.)—*J. Crabbe*.

1937. Goodwin, Donald W., et al. (Washington U., Medical School) **Alcohol and recall: State-dependent effects in man.** *Science*, 1969(Mar), Vol. 163(3873), 1358-1360.—48 male medical students performed 4 memory tasks either while sober or under effects of alcohol. 24 hr. later they were tested under the same or different conditions. In tasks measuring recall and interference, learning transfer was better when S was intoxicated during both sessions than when he was intoxicated only during the learning session. In a task measuring recognition, transfer was not significantly affected by changing state. Thus, alcohol appears to produce "dissociated" or state-dependent effects in man, but not all forms of memory are equally sensitive to the phenomenon.—*Journal abstract*.

1938. Kales, Anthony; Preston, Terry A., Tan, Tjiauw-Ling, & Allen, Clyde. (U. California, Medical School, Los Angeles) **Hypnotics and altered sleep-dream patterns: I. All-night EEG studies of glutethimide, methypyrulon, and pentobarbital.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 211-218.—Studied 3 hypnotics, glutethimide (500 and 1000 mg.), methypyrulon (300 mg.), and pentobarbital (100 mg.) to observe sleep stage, dream alterations, and drug effectiveness in an 8-night experiment with male 21-30 yr. old healthy Ss. REM sleep was decreased in varying degrees by all 3 drugs and dosages. On the 2nd drug night of pentobarbital and the 3rd night of methypyrulon administration the total REM time appeared to return to normal levels. A reduction in the number of REM periods occurred only with the administration of 1000 mg. of glutethimide. Administration of 500 mg. of glutethimide and 100 mg. of pentobarbital resulted in a decrease in Stage 4 sleep. Withdrawal of both drugs did not result in an increase in Stage 4 sleep above base-line levels as is the case for REM sleep following REM suppression. Withdrawal of all drugs and doses resulted in a stage REM rebound, and occasional nightmares were reported. REM rebound, increased dreaming, and nightmares during withdrawal of hypnotic drugs are maximal if long-acting REM-suppressant hypnotics have been taken regularly and in multiple doses for prolonged periods. In the treatment of hypnotic drug dependence, a protracted withdrawal of no more than 1 therapeutic dose every 5 days is recommended. Patients should be advised that increased dreaming and unpleasant dreams may accompany the withdrawal process and are reflections of physiologic rather than psychic changes. (18 ref.)—*Journal summary*.

1939. Sutton, Dwight & Kimm, Joseph. (Arizona State U.) **Alcohol effects on human motor unit reaction time.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 889-892.—Studied control of single motor unit activity in 5 25-39 yr. old human Ss (59-73 kg.) by requiring a single spike discharge to a flash of light and recording the resultant (RT). Experimental sessions without alcohol were followed by ingestion of 20 cm³ 95% ethyl alcohol and retesting the RT performance. Median latencies were slower following intake of alcohol; however, the capacity to respond as defined simply by the ability to produce a motor unit spike was not altered. EMG RT responding also slowed following alcohol, although to a lesser degree than single motor unit RT. (15 ref.)—*Journal abstract*.

1940. Sylvester, John. (Inner London Education Authority, England) **Apparent movement as a constancy phenomenon.** *Studia Psychologica*, 1970, Vol. 12(1), 51-59.—Administered stimulant and depressive drugs to 18 19-25 yr. old female student actresses in an experiment on the effect of such drugs on apparent movement phenomena. The depressant drug sodium amyltal lowered the simultaneity movement threshold and raised the succession movement threshold. Dexedrine had the reverse effect, with the placebo condition in between. Thus predictions from the learning theory of apparent movement were borne out while those from the satiation theory were not. (Czech & Russian summaries) (37 ref.)—*Journal abstract*.

1941. Têtreault, L. & Bordeleau, J. M. (U. Montreal, Quebec, Canada) **De l'utilité du placebo et de la technique à double insu dans l'évaluation des psychotropes.** [On the use of the placebo and the

double-blind technique in the evaluation of psychotropic drugs.] *Encéphale*, 1970(Jan), Vol. 59(1), 5-24.—Total rejection or acceptance of placebo effects without reserve can be damaging in either research or treatment. One has to decide in specific cases whether a placebo is necessary as a control and whether it is morally acceptable to use it. The placebo is merely an instrument of research and should be regarded as such. It may be superfluous and unjustifiable or it may be indispensable for obtaining objective conclusions.—W. W. Meissner.

1942. Wikler, Abraham. (U. Kentucky, Medical School) **Clinical and social aspects of marihuana intoxication.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 320-325.—Discusses the objective and observable aspects of the acute marihuana intoxication syndrome with reference to recent studies reported in the literature. A detailed description by W. Bromberg in 1934 of the progression of emotional and behavioral reactions during intoxication is quoted. Difficulties in identifying a uniform response pattern are attributed to 2 factors: (a) low concentrations of tetrahydrocannabinols in marihuana available in the United States, and (b) a number of predisposing conditions including personality make-up, expectations of the smoker, and the environmental setting. Failure to obtain cross-tolerance between tetrahydrocannabinol and LSD suggest that their site of action in the brain is not the same. Reports of chronic intoxication and unrestricted smoking of marihuana under experimental conditions are reported. Public health and ideological aspects are considered. (17 ref.)—P. McMillan.

1943. Wyatt, Richard J., et al. (National Inst. of Mental Health, Bethesda, Md.) **Effects of para-chlorophenylalanine on sleep in man.** *Electroencephalography & Clinical Neurophysiology*, 1969(Nov), Vol. 27(5), 529-532.—Studied the effect of depleting brain serotonin with parachlorophenylalanine (PCP), a selective inhibitor of serotonin synthesis, on the sleep of man. PCP markedly decreased REM sleep. NREM sleep remained either unchanged or was slightly increased. This is in contrast to the reported effect of PCP in other mammals. In 1 S. at a time when PCP had maximally reduced REM sleep, psychological disturbances were produced similar to those previously described in patients taking PCP. Data suggest that the establishment of any general significance of serotonin in the neuropharmacology of sleep will require detailed investigation of the species in question. (French summary) (17 ref.)—*Journal summary*.

Drug Effects-Animal

1944. Abaskulieva, L. I. (Research Inst. of Clinical & Experimental Medicine, Baku, USSR) **Vliyanie katekholaminov na skorost' krovotoka v malom krugke krovobrazhcheniya na tоне narkoza.** [Influence of catecholamines on the velocity of blood flow in pulmonary circulation during anesthesia.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 25-27.—Ss were intact and narcotized dogs. After the injection of morphine into intact Ss, catecholamines decreased the velocity of blood flow in pulmonary circulation. This did not occur after prior administration of atropine and aminazine (chlorpromazine). The data show that among the factors, securing a vascular response in the pulmonary circulation to catecholamine administration, the initial state of the nervous system played a not inconsiderable role.—I. D. London.

1945. Angel, A. (U. Sheffield, England) **An analysis**

of the effect of 1,2-dihydroxybenzene on transmission through the dorsal column sensory pathway. *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 392-403.—Iv or ip injection of 1,2-dihydroxybenzene in deeply anesthetized animals produces a net increase in the excitability of the dorsal column sensory pathway. The effect lasts for 10 min. or more, depending upon the dose administered and the route of administration. Responses recorded from the primary somatic cortical receiving area and ventrobasal thalamus, to peripheral stimulation, increase in size and show a reduction in the scatter of both size and latency of the individual responses. Responses recorded from the cuneate nucleus show either no change in their size or temporal pattern or a size reduction. These changes are accompanied by generalized EEG "arousal," increased respiratory effort, and changes in the discharge frequencies of cells located in the thalamus outside the dorsal column sensory pathway. It is proposed that the initial increase in excitability is due to an increased responsiveness of the cerebral cortex to a thalamo-cortical volley consequent upon the hyperpnoea produced by the 1,2-dihydroxybenzene. The continuing increase is due to an increased responsiveness of the ventrobasal thalamus brought about by the modulatory influence of the thalamic reticular nuclei. During this latter period the cortical responsiveness to electrical stimulation of the thalamocortical fibers is unaltered or decreased. (French summary) (20 ref.)—*Journal summary*.

1946. Baryshnikov, I. I., Mil'shtein, G. I., Fufacheva, A. A., & Khasabov, G. A. (Inst. of Experimental Pathology & Therapy, Sukhumi, USSR) **Vliyanie psikhodomimetika na uslovnorefleksornuyu deyatel'nost' i elektroentsefalogrammu obez'yan.** [Influence of a psychotomimetic on simian conditioned reflex activity and electroencephalogram.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 35-41.—Ss were subjected to the action of the central cholinolytic, diatrane (.1, .2, and .5 mg/kg). 4-5 yr. old rhesus monkeys were used to study the influence of the drug on spontaneous motor activity and a simple motor-alimentary CR "of the motivational type" (pressing of a lever with subsequent alimentary reinforcement); 2 11-13 yr. old baboons were used to study the influence of the drug on varied (alimentary and electrodefensive) motor CRs. The lowest dosage did not exert any noticeable effect on behavior, but did disturb differentiation and briefly decreased the stability of the positive alimentary CR in baboons. .2 and .5 mg/kg diatrane doses which elicit human psychopathological symptomatology) had a depressing influence on the CNS and produced rapid and deep disturbances of alimentary and defensive CRs (more markedly for .5 mg/kg). Restoration of the former occurred later than that of the latter. These doses in rhesus monkeys led to inhibition of the simple motor-alimentary CR "of the motivational type." The duration of the changes occurring in the EEG coincided with the duration of the observed behavioral disturbances. These doses produced an increase in amplitude of evoked potential in (a) the frontal cortex in response to stimulation of the caudate nucleus and the striopallidum, and (b) the hippocampus in response to stimulation of contiguous regions. Responses in the frontal cortex did not change when the hippocampus was stimulated.—I. D. London.

1947. Bhattacharya, I. C. & Goldstein, L. (New Jersey Neuropsychiatric Inst., Princeton) **Influence of acute**

and chronic nicotine administration on intra- and inter-structural relationships of the electrical activity in the rabbit brain. *Neuropharmacology*, 1970(Mar), Vol. 9(2), 109-118.—Performed chronic nicotine administrations for 3 wk. on male albino rabbits equipped with electrodes in the cortex, the reticular formation, the hippocampus, the amygdala, and the hypothalamus. 200 μ g/kg were injected subcutaneously 5 times/day. Controls were run with chronic saline administration. Statistical analysis of the distribution of amplitude levels/successive epochs of 2 sec. revealed a change. The characteristic unimodal distributions were replaced at cortical and hippocampal levels by bimodal distributions. The extent of mutual involvement between structures was estimated by the ratio of the variances between structures. Chronic nicotine administration produced a gradual increase for the pairs cortex/hippocampus and cortex/amygdala. Results are discussed in terms of a recently introduced hypothesis of a 2-system arousal in the brain. (15 ref.)—*Journal abstract*.

1948. Bickel, M. H. & Weder, H. J. (U. Berne, Switzerland) **Demethylation of imipramine in the rat as influenced by SKF 525-A and by different routes of administration.** *Life Sciences*, 1968(Nov), Vol. 7(21, Pt. 1), 1223-1230.—Ip injection of imipramine (IP) to normal male Wistar and female Holtzman rats was followed by the appearance of desmethylimipramine (DMI) in brain and other tissues. In Ss pretreated with 2-diethylaminoethyl-2', 2'-diphenyl valerate HCL (SKF 525-A) the DMI concentrations were decreased but still detectable. The inhibition of IP metabolism by SKF 525-A can be demonstrated in vitro. After injection of IP by various other modes of administration, differences in the IP and DMI concentrations in brain or other tissues were observed, e.g., practically no DMI could be detected in brain after subcutaneous or im injection. It is concluded that the mode of administration highly influences both the rates of drug absorption and its metabolism, the latter according to systemic or portal absorption. Results are discussed in respect to the absence of brain DMI in rats treated with IP. (17 ref.)—*Journal summary*.

1949. Bocknik, S. E., Hingtgen, J. N., Hughes, F. W., & Forney, R. B. (Abbott Lab., Chicago, Ill.) **Harmaline effects on tetrabenazine depression of avoidance responding in rats.** *Life Sciences*, 1968(Nov), Vol. 7(21, Pt. 1), 1189-1201.—6 adult male Wistar rats on 40-sec response-shock interval and a 20-sec shock-shock interval avoidance schedule of reinforcement were administered tetrabenazine and harmaline both individually and combined in various time and dose sequences. The effects of harmaline on the tetrabenazine response were both antagonistic and synergistic. Tetrabenazine alone elicited behavioral depression of avoidance responding. Harmaline pretreatment had an antagonistic effect on the tetrabenazine response producing an increase in the latency of depression followed by a synergistic increase in the duration of depression. (19 ref.)—*Journal summary*.

1950. Buckholtz, Neil S. & Bowman, Robert E. (U. Wisconsin, Regional Primate Research Center) **Retrospective amnesia and brain RNA content after TCAP.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 911-914.—Reinvestigated previous findings that 1,1,3-tricyano-2-amino-1-propene (TCAP) increases the whole brain content of RNA and attenuates the retrograde amnesia produced by ECS in mice. This is consistent with theories that RNA synthesis represents an essential

step in the consolidation of memory. Using 766 CF1 and Swiss-Webster mice, it was found that TCAP had no effect at any point along the gradient of retrograde amnesia when ECS was given at 9-960 sec. after training in a 1-trial passive avoidance task. TCAP also did not alter the whole brain content of RNA nor the uptake of tritiated cytidine into RNA. It is concluded that under a variety of conditions TCAP does not affect retrograde amnesia produced by ECS, thus suggesting that it has no general effect on the rate of memory consolidation. (22 ref.)—*Journal abstract*.

1951. Chase, T. N., Katz, R. I., & Kopin, I. J. (National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) **Effect of diazepam on fate of intracisternally injected serotonin- C^{14} .** *Neuropharmacology*, 1970(Mar), Vol. 9(2), 103-108.—Studied the influence of diazepam on the disposition of intracisternally injected serotonin- C^{14} (5-HT- C^{14}) in male Sprague-Dawley rats. Pretreatment with diazepam failed to affect the uptake of this monoamine into brain. Whole brain levels of 5-HT- C^{14} and 5-hydroxyindoleacetic acid- C^{14} (5-HIAA- C^{14}), substantially above control levels, were found in diazepam-treated Ss killed 3 hr. after 5-HT- C^{14} administration. The drug markedly retarded the efflux of intracisternally administered 5-HIAA- C^{14} but had no effect on metaraminol- H^3 , a monoamine which is not metabolized in brain. Findings suggest that diazepam acts on mechanisms subserving the transport of 5-HIAA from brain and on the cerebral metabolism of 5-HT. (35 ref.)—*Journal abstract*.

1952. Contreras, E., Tamayo, L., & Weitzman, P. (U. Concepción, Chile) **Reduction of the antinociceptive effect of 5-hydroxytryptophan in morphine tolerant rats.** *Psychopharmacologia*, 1970, Vol. 17(4), 314-319.—Studied the effect of 5-hydroxytryptophan on electric shock pain threshold in female albino rats, tolerant and nontolerant to the analgesic action of morphine. The drug elevated pain threshold and exhibited an additive effect with morphine analgesia in nontolerant Ss. A reduction of the antinociceptive action of the serotonin precursor and an absence of the additive effect with morphine was observed in Ss tolerant to the analgesic. (17 ref.)—*Journal abstract*.

1953. Coyle, Joseph T. & Snyder, Solomon H. (Johns Hopkins U., Medical School) **Antiparkinsonian drugs: Inhibition of dopamine uptake in the corpus striatum as a possible mechanism of action.** *Science*, 1969(Nov), Vol. 166(3907), 899-901.—Reports that a variety of antiparkinsonian drugs are potent, non-competitive inhibitors of dopamine uptake into synaptosomes in homogenates of male Sprague-Dawley rat corpus striatum. Inhibition of dopamine uptake may potentiate the synaptic actions of dopamine in the striatum and could explain the antiparkinsonian effects of these drugs. This hypothesis accounts for several clinical features of Parkinson's disease and predicts compounds which may be new therapeutic agents. (16 ref.)—*Journal abstract*.

1954. D'Encarnacao, Paul S. & Anderson, Kenneth. (Memphis State U.) **Effects of lithium pretreatment on amphetamine and DMI tetrabenazine produced psychomotor behavior.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 494-496.—Further examines the catecholamine hypothesis that "the increased availability of catecholamines at synaptic sites are associated with behavioral stimulation or excitation while a decreased availability or inactivation... relates to depression or sedation." Ss were rats injected with either amphetamine

or a combination of despiramine (DMI) + tetrabenazine following a pretreatment administration of amphetamine or DMI. Activity count data were obtained on all Ss during pretreatment and experimental sessions. Results suggest that (a) lithium in the pretreatment period had a calming effect; (b) "lithium pretreatment to amphetamine excitation produced a potentiation of the behavioral effects with almost double the initial psychoactive behavior which amphetamine would normally produce," suggesting a synergistic effect; and (c) lithium does not block the effects of DMI + tetrabenazine. The relation of these findings to other studies is examined.—*P. McMillan.*

1955. Denisova, G. A. (1st Leningrad Medical Inst., USSR) *Znachenie kholinergicheskoi mediatelli v tsentral'noi regulyatsii dykhaniya.* [Significance of cholinergic mediation in central regulation of respiration.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(2), 9-12.—Cats were used in a study of the action of the central cholinolytic preparation, metamizyl, in order to determine more precisely the significance of cholinergic mediation in the formation of respiratory reactions in different zones of the bulbar respiratory center. Unequal sensitivity of different "respiratory zones" to metamizyl was in evidence when different structures of the medulla oblongata were subjected to local stimulation and recordings were made of the respiratory reactions. Under the effect of metamizyl, maximal ex- and inspiratory changes occurred without any substantial shifts in "background respiration." The data provide evidence for differences in (a) the neurochemical organization of the central mechanisms of respiratory regulation, and (b) the degree to which cholinergic mediation participates in the processes involved. An independence existed between mechanisms, associated with "background respiration," and those, associated with abrupt shifts in the direction of ex- and inspiration.—*I. D. London.*

1956. Elliott, R. C. (Medical Coll. of St. Bartholomew's Hosp., London, England) *The action of central depressant drugs on the spontaneous discharge of action potentials in the superior cervical sympathetic trunk of the cat.* *Neuropharmacology*, 1970(Mar), Vol. 9(2), 129-136.—Recorded spontaneous action potentials in strands dissected from the preganglionic superior cervical trunk of cats anesthetized with ether and nitrous oxide. The rate of discharge of spontaneous action potentials was reduced by 63.7% of a tranquilizer, after .5 mg/kg chlorpromazine iv. A local anesthetic action was insufficient to account for the reduction in rate which occurred, and the reduction is due to a centrally mediated action. The tranquilizer, perphenazine, in a dose of 1 mg/kg iv reduced the rate of discharge by 61.6%. Pentobarbitone reduced the rate of discharge by 66.4% in a dose of 10 mg/kg iv, but 2 mg/kg had little or no effect. Results with hydroxyzine and benactyzine were variable. Hydroxyzine had no action in some experiments, but in others 2 mg/kg iv, produced a reduction of from 25-70%. Benactyzine had little effect, the greatest reduction observed being only 28%. It is concluded that some tranquilizers reduce the rate of discharge in a preganglionic sympathetic nerve. This may be a contributory factor in producing their psychotropic effects in man. (16 ref.)—*Journal abstract.*

1957. Gauron, Eugene F. & Rowley, Vinton N. (U. Iowa) *The modifiability of infantile shock traumatization effects by contiguous drug administration.*

Journal of Genetic Psychology, 1970(Sep), Vol. 117(1), 51-56.—Explored the effectiveness of tranquilizing drugs in modifying learning deficits associated with shock traumatization in infancy, and tested the explanatory value of the state-dependent learning model by the addition of a more potent drug, haloperidol. 48 albino rats were subdivided by a split-litter technique into 4 drug groups. The drug dosage levels were 3 mg/kg chlorpromazine, .5 mg/kg diazepam, .1 mg/kg haloperidol and an equivalent volume of isotonic saline. Drugs and shock were administered from Days 10-25 of life with avoidance conditioning beginning at 75 days. Analyses of variance support the previous finding that tranquilizing drugs are useful in modifying trauma effects. While chlorpromazine was the most effective drug, haloperidol was not effective in modifying learning deficits. This latter finding was viewed as casting doubt on a state-dependent model.—*Journal summary.*

1958. Ginzel, K. H., Eldred, E., Watanabe, S., & Grover, F. (Riker Lab., Northridge, Calif.) *Drug-induced depression of gamma efferent activity: I. Peripheral reflexogenic effect of nicotine.* *Neuropharmacology*, 1970(Mar), Vol. 9(2), 151-167.—Found nicotine in doses of 40-80 µg/kg iv produced a generalized depression of spontaneous and reflexly-evoked γ efferent and attendant spindle afferent discharge in the cat under chloralose-urethane anesthesia. This depressant action was duplicated by sebacylcholine, a peripherally-acting nicotinic stimulant, and abolished by hexamethonium, a peripherally-acting nicotine antagonist. It was reduced or abolished by bilateral vagotomy. It is proposed that nicotine depresses γ activity by a reflex action arising from sensory receptors, a portion of which are within the vagal distribution. Small amounts of nicotine or sebacylcholine injected into the carotid sinus or into the lower aorta also affected γ discharge. The γ depression produced by nicotine does not appear to be secondary to the blood pressure effects of the drug. The γ depression was preceded by an inconstant brief acceleration probably also of reflex origin. After spinal transection at C₁, the γ depressant effect of nicotine was abolished while the acceleratory response was still elicitable. The initiation of both reflex effects is due to excitation by nicotine of cholinergic receptor sites at sensory terminals. (32 ref.)—*Journal abstract.*

1959. Guerrero-Figueroa, R., Rye, Merrill M., Gallant, D. M., & Bishop, M. P. (Tulane U., Medical School) *Electrographic and behavioral effects of diazepam during alcohol withdrawal stage in cats.* *Neuropharmacology*, 1970(Mar), Vol. 9(2), 143-150.—Evaluates CNS spontaneous and evoked cortical and subcortical activities in cats during chronic alcohol administration and following alcohol withdrawal. In the normal (N = 10), and epileptic (N = 12) Ss, alcohol was administered through a gastric cannula chronically inserted in each S in the upper quadrant of the greater curvature of the stomach. Chronic alcohol administration produced: an increase of EEG fast activity in cortical and subcortical structures associated with suppression of epileptiform discharges; and a decrease in the amplitude of the local evoked potentials recorded from cortical and subcortical structures. In contrast, withdrawal from alcohol produced: an increase in EEG slow wave background activity associated with activation of epileptiform discharges; and an increase in the amplitude of the local evoked potentials recorded from cortical and

subcortical structures. An evaluation of the effects of iv and ip administration of diazepam was presented. It is concluded that diazepam is an effective drug in the prevention and control of the withdrawal syndrome. Electrical and behavioral studies suggest that chronic alcohol administration has an inhibitory effect upon the integrative action of the CNS, and a reversal of this effect occurs during the withdrawal syndrome. Possible mechanisms for 2 such inverse neurophysiological actions are discussed. (19 ref.)—*Journal abstract.*

1960. Gushchin, I. S. (USSR Academy of Medical Sciences, Research Allergological Lab., Moscow) **Deistvie mikroelektroforeticheskoi in'ektsii mediatorov na odinochnye kletki izolirovannogo predserdiya morskikh svinek.** [Action of microelectrophoretic injection of mediators on single cells of the isolated atrium in guinea pigs.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 3-6.—Reports results of a microelectrode study of the action of adrenaline, histamine, and acetylcholine, microelectrophoretically injected, on single atrial cells (pacemakers and contractile fibers), derived from 15 Ss.—*I. D. London.*

1961. Halasz, Michael F., Formanek, Jaroslav, & Marrazzi, Amedeo S. (U. Minnesota) **Hallucinogen-tranquillizer interaction: Its nature.** *Science*, 1969(May), Vol. 164(3879), 569-571.—Study of the competition between hallucinogens and tranquilizers at cerebral synapses and on behavior in various species of animals indicates a continuum of effects from protection to dominance of tranquilizer toxicity as the dose increases. Data on the behavior of 3 cats and 5 spider monkeys, supplementing that on the rat, show that it is possible to arrive at a tranquilizer dose that can aggravate instead of protect, in accord with the competitive inhibitory nature of the interaction of hallucinogen and tranquilizer.—*Journal abstract.*

1962. Hingtgen, Joseph N. & Hamm, Harlyn D. (Indiana U., Medical School, Inst. of Psychiatric Research, Indianapolis) **Modification of tetrabenazine effects following pain-induced aggression in rats.** *Life Sciences*, 1969(Jan), Vol. 8(1, Pt. 1), 1-7.—Measured pain-elicited aggression in 4 groups of 5 pairs of Wistar rats each during 4 electric shock sessions. 2 groups received injections of tetrabenazine and saline, respectively, 90 min. before each session. In the other 2 groups tetrabenazine and saline injections were alternated before each session, 1 group starting with tetrabenazine and the other with saline. Tetrabenazine produced marked inhibition of the aggressive response, reducing its frequency to about 10% of saline levels. However, an initial experience of high aggression during a saline session significantly modified the tetrabenazine effects for subsequent injections, suppressing aggression to only about 40% of control values.—*Journal summary.*

1963. Jackson, D. A., Anderson, J. M., & Gardner, D. R. (Fisheries Research Board of Canada, Biological Station, St. Andrews, New Brunswick) **Further investigations of the effect of DDT on learning in fish.** *Canadian Journal of Zoology*, 1970(May), Vol. 48(3), 577-580.—Young Atlantic salmon (*Salmo salar*) and speckled trout (*Salvelinus fontinalis*) were trained in a conditioned avoidance apparatus to avoid an electric shock. The CS was a light change. When the learning criterion of 6 successive avoidances had been met, DDT in .3 ml. of acetone was injected into the 6 liters of water in the training tank. On retraining, the salmon were

found capable of learning a conditioned avoidance response after treatment with sublethal doses of DDT. The trout learned the "wrong" response but they did associate the CS with the UCS by swimming to the surface of the water following presentation of the CS alone.—*J. M. Roberts.*

1964. Klingman, Gerda I. & McKay, Genie. (State U. New York, School of Pharmacy, Buffalo) **The effect of isoproterenol on the catecholamine levels of peripheral tissues.** *Neuropharmacology*, 1970(Mar), Vol. 9(2), 137-142.—The subcutaneous administration of 1 or 4 doses of 50 mg/kg of isoproterenol to Sprague-Dawley rats resulted in significant reductions in the norepinephrine levels of the heart, submaxillary glands, and parotid glands. The decreases noted in these tissues after a single dose of 7.5 mg/kg were statistically significant only for the parotid glands. The norepinephrine levels of the brainstem, sympathetic ganglia, and other peripheral tissues were not affected by the isoproterenol treatments. The wet weights of the hearts, submaxillary glands, and parotid glands were not significantly affected by the single 7.5 mg/kg dose, but show statistically significant increases after 1 and 4 doses of 50 mg/kg. The wet weights of other peripheral tissues were not altered by isoproterenol treatment. The reductions of the norepinephrine concentration and content of the heart, submaxillary and parotid glands, and the increases in the wet weight of these tissues were of similar magnitude in male and female Ss. (17 ref.)—*Journal abstract.*

1965. Kontsevoi, V. M. (Medical Inst., Vitebsk, USSR) **Vliyanie nekotorikh vegetotropnykh yadrov na mitoticheskuyu aktivnost' regeneriruyushchego epitel'ya slizistoi obolochki zheludka.** [Influence of some autonomic poisons on mitotic activity of the regenerating gastric mucosal epithelium.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(2), 98-100.—92 rats with experimental lesion of the gastric mucosa were administered autonomic poisons, i.e., atropine sulfate, hexonium (hexamethonium), phentolamine hydrochloride, aceclidine, dimecoline, mesaton, every 12 hr. for 5 days. It was shown that repeated administration of hexonium—a preparation used for treating ulceration—produced the sharpest inhibition of repair to the damaged tissue.—*I. D. London.*

1966. Malyarenko, Yu. E. (Inst. of Normal & Pathological Physiology, Moscow, USSR) **Vozbuzhdayushchee vliyanie atsetilkholina na refleksogennuyu zonu epikarda i perikarda vagotomirovannykh zhivotnykh.** [Excitatory influence of acetylcholine on the reflexogenic zone of the epicardium and pericardium in vagotomized animals.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(2), 3-6.—Ss were 24 urethanized cats under artificial respiration, with sectioned vagal, aortal, and occasionally diaphragmatic nerves. Any supraliminal concentration produced pressor reflexes exclusively, given the spinal afferent system of the epi- and pericardium under stimulation by acetylcholine in concentrations of .001-1000 microgm/ml. These reflexes may be divided into 2 groups: "the strictly interoceptive and the nociceptive." Through recordings of blood pressure, it was established that the interoceptive reflexes emerged with .001-.5 concentrations; the nociceptive reflexes emerged with 1-10 concentrations. The "acetylcholine concentration-reflex amplitude" graph consisted of 3 parts and exhibited a fundamental resemblance to the graphed function for the reflexogenic zone of the small intestine. Liminal con-

centrations of acetylcholine for the cardiac reflexogenic zone were lower than for the sensitive elements of the small intestine.—*J. D. London.*

1967. McKearney, James W. (Worcester Foundation for Experimental Biology, Shrewsbury, Mass.) **Rate-dependent effects of drugs: Modification by discriminative stimuli of the effects of amobarbital on schedule-controlled behavior.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 167-175.—Food-deprived adult male white Carneaux pigeons responded under a 10-min fixed-interval schedule of food presentation. During even-numbered min. of the schedule, the discriminative stimuli were the same as those present when food was delivered. During odd-numbered min. there was either a change in keylight color or in overhead illumination, either for the entire duration of the odd-numbered min. or for 3 sec. after each response. Responding during even-numbered min. showed the usual pattern of positive acceleration; responding during odd-numbered min. was similarly graded, but rates were much lower. The response-rate-increasing effects of amobarbital were inversely related to control rates of responding for both even- and odd-numbered min. However, when the stimulus change during odd-numbered min. was either keylight color or a change from a darkened to a brightly illuminated chamber, increases in responding were considerably less than predicted on the basis of the effects on responding during even-numbered min. When the stimulus change was from a darkened to a dimly illuminated chamber, control rates of responding changed little, but increases in responding during odd-numbered min. after amobarbital were considerably greater, and of the approximate order expected on the basis of control rate.—*Journal abstract.*

1968. McMillan, D. E. & Campbell, R. J. (U. North Carolina, Medical School) **Effects of d-amphetamine and chlorthalidone on spaced responding in pigeons.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 177-184.—Studied the effects of d-amphetamine and chlorthalidone in 6 male white Carneaux pigeons on performance (a) under a schedule that reinforced responses on a key (food key) if they were more than 20 sec. apart, (b) under the same schedule when responses also were required on a collateral key during the interresponse time (IRT) on the food key, and (c) under the same schedule when responses were required on a collateral key during the IRT on the food key and collateral-key responses could produce a stimulus correlated with the availability of food. Under all 3 space-responding schedules, d-amphetamine and chlorthalidone at low dose levels slightly increased the frequency of short IRTs on the food key for about $\frac{1}{2}$ the Ss, and either did not affect the IRT patterns of the other Ss or lengthened the durations slightly. At higher dose levels, d-amphetamine and chlorthalidone increased the frequency of long IRTs or abolished responding in all Ss. Changes in the pattern of IRTs on the food key did not seem to depend on changes in the rate or pattern of collateral-key responses.—*Journal abstract.*

1969. Melville, K. I. & Johnson, M. C. (McGill U., Montreal, Quebec, Canada) **Cerebrospinal fluid electrolyte changes during lateral ventricular perfusion with noradrenaline and associated cardiovascular responses.** *Neuropharmacology*, 1970(Mar), Vol. 9(2), 79-95.—Studied changes of the concentration of elec-

trolytes (Na^+ , K^+ , Ca^{2+} , and Mg^{2+}) in cerebral spinal fluid (CSF), blood pressure, and heart rate elicited by 60-min perfusion of the lateral ventricle in vagotomized cats under chloralose anesthesia. Perfusion with artificial CSF neither changed the electrolytes of CSF nor the blood pressure and the heart rate. Perfusions with artificial CSF containing noradrenaline (.08–8 $\mu\text{g}/\text{ml}$) decreased Na^+ concentrations in the CSF and elicited hypotension, without changing the heart rate. Perfusions with high doses of noradrenaline (80–160 $\mu\text{g}/\text{ml}$) increased K^+ concentrations in the CSF and elicited hypertension and tachycardia. With prolonged perfusions tolerance or tachyphylaxis developed to these responses to noradrenaline. Intraventricular pretreatment with the tranquilizers or antidepressants—reserpine, tranlycypromine, chlorpromazine, and imipramine increased K^+ and Mg^{2+} concentrations in the CSF; Ca^{2+} concentrations were also increased by chlorpromazine and imipramine, but Na^+ concentrations were not affected. After reserpine or tranlycypromine pretreatment, the increase of K^+ concentrations, the hypertension and tachycardia induced by noradrenaline were antagonized to variable degrees. After chlorpromazine or imipramine pretreatment, noradrenaline still induced hypertension and tachycardia associated with no further change in K^+ , but decrease in Mg^{2+} concentration. It is postulated that: (a) centrally-mediated cardiovascular responses induced by intraventricular noradrenaline involve changes in CSF and possibly in brain Na^+ and/or K^+ , and (b) that reserpine, tranlycypromine, chlorpromazine, and imipramine appear to induce significant shifts in brain Mg^{2+} and Ca^{2+} concentrations which might explain some actions of these drugs on the CNS. (32 ref.)—*Journal abstract.*

1970. Merritt, James H. & Medina, Miguel A. (USAF School of Aerospace Medicine, Brooks Air Force Base, Tex.) **Altitude-induced alterations in drug action and metabolism.** *Life Sciences*, 1968(Nov), Vol. 7(21, Pt. 1), 1163-1169.—Found that male C57 strain mice maintained at 18,000 ft. for 5 days and then injected with 125 mg. hexobarbital/kg had decreased sleeping time, smaller concentrations of brain hexobarbital 50 min. after injection, and increased liver microsomal metabolism of the drug compared to ground level controls. Under the same conditions, brain levels of hexobarbital in awakening Ss was the same for both groups. The significance of these observations is discussed in relation to changes in drug action at altitude. (15 ref.)—*Journal summary.*

1971. Nachman, Marvin. (U. California, Riverside) **Learned taste and temperature aversions due to lithium chloride sickness after temporal delays.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 22-30.—78 Sprague-Dawley rats, reared on water, were given saccharin and then made sick with a single lithium chloride (LiCl) injection after various intervals. Similarly, Ss reared on saccharin were made sick with LiCl at various times after drinking water. In both conditions, Ss learned to avoid drinking the fluid which preceded sickness and the amount of aversion was a function of the sickness delay time. Similar tests with 43° C water as the CS also produced learned aversions, but the longest effective sickness delay time with the temperature cue was less than 1 hr. compared to several hr. with the taste cues. In Exp. III, Ss, experienced with water and saccharin, learned

specifically to avoid the fluid which they had drunk preceding their sickness, even with sickness delay times of several hr.—*Journal abstract.*

1972. Panov, P. A. (Kirov Military-Medical Academy, Leningrad, USSR) **Elektroéntsefalograficheski analiz éksperimental'nogo psikhoha, vyzvannogo ditranom.** [Electroencephalographic analysis of experimental psychosis brought on by ditran.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970, Vol. 70(2), 261-264.—10 cats with implanted electrodes were used to study (a) the action of a threshold dose of ditran on background EEGs of the various structures of the brain, taking into account their variability and character of adaptation to prolonged photostimulation, and, in connection with this, (b) amplitude of evoked potentials as a function of intensity of light flash, and (c) the influence of acoustic stimulation on the adapted cortical evoked responses. The decline of the rhythmic character of the potentials in the visual cortex, which is connected with the considerable fluctuations of the excitatory cycles, the enhanced variability of evoked potentials, the absence of adequate cortical reaction to photostimulation of various brightness, and also the disturbance of the interrelations of the visual and auditory analyzers may lie at the basis of the loss of goal-directed behavior, recognized here as experimental psychosis. (English summary)—*I. D. London.*

1973. Pavlova, I. I. & Khaikina, B. I. (All-Union Research Inst. of the Hygiene & Toxicology of Pesticides, Polymers, & Plastics, Kiev, USSR) **Osobennosti raspredeleniya nikotinamidnykh kofermontov (NAD i NADF) v kletochnykh strukturakh pecheni i mozga pri vvedenii DDT.** [Features characterizing the distribution of the nicotinamide coenzymes (NAD and NADP) in the hepatic and cerebral cellular structures following DDT administration.] *Byulleten' Éksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 47-50.—DDT administration over a period of time led to a uniform decline in the level of the nicotinamidadenine nucleotides (NAD and NADP) in the cellular structures of the rat brain.—*I. D. London.*

1974. Potts, Walter J. (Purdue U.) **An investigation of drug effects on learning and memory in rats.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5721.

1975. Powell, Barbara J. (Malcolm Bliss Mental Health Center, St. Louis, Mo.) **The role of d-amphetamine-amobarbital in suppressing freezing behavior during avoidance acquisition and extinction.** *Psychological Record*, 1970(Win), Vol. 20(1), 101-105.—Investigates the effects of a combined dosage of d-amphetamine sulfate and amobarbital sodium on the freezing behavior of 40 naive male Wistar rats during avoidance acquisition and suppressed freezing; however, withdrawal of 1 or both drugs during extinction resulted in differential performance, suggesting that drug effects were state-dependent. (16 ref.)—*Journal abstract.*

1976. Puzik, V. I., Berdyeva, A. T., & Dyukanova, M. Ya. (Central Research Inst. of Tuberculosis, Moscow, USSR) **Aktivnost' suksinatdehidrogenazy v organakh belykh kryss pri intoksikatsii yadom gyurzy.** [Activity of succinate dehydrogenase in the organs of white rats with intoxication by snake venom.] *Byulleten' Éksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 93-94.—In lethal doses of the venom, the activity of succinate dehydrogenase was at all times somewhat

higher in brain tissue than was true for controls.—*I. D. London.*

1977. Richter, Judith A. & Goldstein, Avram. (Stanford U., Medical School) **The effects of morphine-like compounds on the light response of the brine shrimp *artemia salina*.** *Psychopharmacologia*, 1970, Vol. 17(4), 327-337.—Describes methods for measuring light responses of *Artemia nauplii* and adults. Levorphanol inhibited and partially reversed the negative phototaxis of adults. Levorphanol was also effective in adults after removal of the compound eyes, indicating that it acts on the median eye or its central connections. Methadone and dextrorphan caused similar effects in adults, but morphine was inactive. Pentobarbital inhibited the negative movement but induced little positive phototaxis. Attempts to reverse the effect of levorphanol with nalorphine pretreatment were unsuccessful. Tolerance to levorphanol could not be developed; shrimp died of the increasing effect of the drug with time.—*Journal abstract.*

1978. Rogers, K. J. & Thornton, J. A. (U. Sheffield, England) **The interaction between monoamine oxidase inhibitors and narcotic analgesics in mice.** *British Journal of Pharmacology*, 1969(Jul), Vol. 36(3), 470-480.—Administration of either iproniazid or tranlylcypromine to male albino mice potentiated the acute toxicity of pethidine, morphine, pentazocine, and phenazocine. Blood levels of pentazocine in Ss pretreated with tranlylcypromine did not differ from levels in Ss not receiving the MAO inhibitor. There was no correlation between changes in brain and liver MAO activity and increased pethidine toxicity. A comparison was made between the change in pethidine toxicity and the changes in the concentration of cerebral noradrenaline, dopamine, and 5-hydroxytryptamine following tranlylcypromine injection. It is concluded that the increased toxicity of potent analgesics in combination with MAO inhibitors is not due to a decelerated metabolism of the analgesic drug, but is related to an increased concentration of cerebral 5-hydroxytryptamine. A critical level of this monoamine, in the brain, may be necessary before the drug interaction will take place. (32 ref.)—*Journal abstract.*

1979. Sanghvi, I., Bindler, E., & Gershon, S. (New York U., Medical School) **The evaluation of a new animal method for the prediction of clinical antidepressant activity.** *Life Sciences*, 1969(Jan), Vol. 8(1, Pt. 1), 99-106.—Evaluated a new animal method to predict clinically useful antidepressant agents. The test relies on the potentiating effects of antidepressants on the behavioral and physiological changes induced by yohimbine (YOH) in the conscious dog. 2 agents, N-acetylnyl-N, N-dimethyl benzoammonium chloride and 4-phenyl bicyclo (2,2,2) octan-1-amine hydrochloride monohydrate, which were predicted to be useful antidepressant agents from the animal tests, failed to potentiate YOH induced changes, unlike imipramine. Clinically they were found to lack any antidepressant activity. It is proposed that this test should be further evaluated employing established and potential antidepressant agents.—*Journal abstract.*

1980. Schneider, C. (Parke, Davis, & Co., Hounslow, England) **Behavioural effects of some morphine antagonists and hallucinogens in the rat.** *Nature*, 1968(Nov), Vol. 220(5167), 586-587.—Investigated the behavioral effects of 11 morphine antagonists and hallucinogens 20 min. after subcutaneous administration

in a dose volume of 10 ml/kg body weight to groups of Wistar rats. Bizarre behavior (i.e., walking backwards, turning head more than 20 times/min, etc.) resulted from cyclazocine, levallorphan, amphetamine, phencyclidine, and psilocybin. LSD (3-20 mg/kg) produced bizarre behavior in only 20% of the Ss, but it produced fighting behavior at doses of 5 mg/kg. It is concluded that behavioral effects caused by hallucinogenic drugs are consistent with those which have been reported in humans.—P. Shibelski.

1981. Sethy, Vimala H., Pradhan, Ratan J., Mandrekar, S. S., & Sheth, U. K. (Seth G. S. Medical Coll., Bombay, India) **Role of brain amines in the analgesic action of meperidine hydrochloride.** *Psychopharmacologia*, 1970, Vol. 17(4), 320-326.—The effective dose (ED) 50 of meperidine was significantly increased by all methods when male albino Haffkine mice were pretreated with reserpine. α -methyl-m-tyrosine significantly increased the ED 50 of meperidine by the clip method. P-chlorophenylamine pretreatment significantly increased the ED 50 of meperidine by the clip and shock methods. (23 ref.)—*Journal abstract.*

1982. Shtil'bins, V. I. (Kirov Military-Medical Academy, Leningrad, USSR) **Vliyaniye amizyla i ganglerona na embriogenez kur.** [Influence of amizyl and gangleron on chicken embryogenesis.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(2), 106-109.—980 8-day-old chicken embryos were used to study the influence of the M-cholinolytic, amizyl (benactyzine), and the N-cholinolytic, gangleron, on the development of chicken embryos. The teratological effects are detailed.—I. D. London.

1983. Suchkov, V. V. (Inst. of Therapy, Moscow, USSR) **Vliyaniye angiotenzina II na mozgovo krovobrashchenie.** [Influence of angiotensin II on cerebral circulation.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 203-209.—19 dogs under urethane-chloralose narcosis and 4 rabbits under urethane narcosis (both groups with almost total humoral isolation of the brain) were used to study cerebral circulation, oxygen tension (pO_2), and redox potential in the reticular formation of the brainstem under the influence of iv administered .5 microgm/kg angiotensin II (hypertensin II). Despite a brief increase in systemic arterial pressure and cerebral blood flow, the resistance of the cerebral vessels increased significantly and redox dropped despite an increase in pO_2 . These effects were increased if the normal functions of the baroreceptors of the carotid sinus were disturbed. The application of atropine, aminazine (chlorpromazine), the perfusion of the brain under constant pressure modified the complex neurohumoral action of angiotensin II on the cerebral vessels. (English summary) (34 ref.)—I. D. London.

1984. Vaf'dman, A. V. & Kozlovskaya, M. M. (1st Leningrad Medical Inst., USSR) **Eksperimental'noe izucheniye trunkvillizuyushchego i antidepressivnogo deystviya tsentral'nykh kholinolitkov.** [Experimental study of the tranquilizing and antidepressant action of central cholinolytics.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 51-56.—32 rabbits, with electrodes implanted in the posterior parts of the hypothalamus, medial and lateral parts of the septal region, were used to study: (a) the tranquilizing and antidepressant action of a number of central cholinolytics (metamizyl, amizyl, scopalamine) in states of emotional excitation and depression, elicited through stimulation, respectively, of the hypothalamic periventricular nuclei and the medial parts of the septum; and (b) the

connection of the foregoing action with changes in intracental (septo-hypothalamic and intraseptal) regulatory interrelationships. In small doses the central cholinolytics: (a) displayed a tranquilizing action, in that the emotional state in aggressive-defensive behavior was suppressed; (b) disrupted intraseptal relationships, in that the effects of stimulation of the lateral parts of the septum are blocked; and (c) promoted the appearance of inhibitory influences from the medial parts of the septum. In large doses, the central cholinolytics suppressed the inhibitory influences of the septum, which fact may have something to do with their antidepressant action.—I. D. London.

1985. Varagić, V. M. & Kažić, T. (Medical Faculty, Belgrade, Yugoslavia) **The acute effect of 6-hydroxydopamine on the blood pressure responses to eserine and tyramine in the rat.** *Neuropharmacology*, 1970(Mar), Vol. 9(2), 97-102.—In low doses (1-10 mg/kg) 6-hydroxydopamine (6-OH-DA) produced a dose-dependent blood pressure rise. Higher doses (15 mg/kg) produced a blood pressure rise of smaller degree, but of longer duration and accompanied by a significant and long-lasting tachycardia. Responses were depressed in reserpine (tranquilizer) treated animals. Tachyphylaxis to 6-OH-DA developed very quickly after a dose level of 15-20 mg/kg was reached by repeated injections. Depending on the dose, 6-OH-DA produced either a slow developing block of the hypertensive effect of eserine, or an immediate abolition of the eserine response. The same doses also produced a complete block of the hypertensive responses both to tyramine and to small doses of 6-OH-DA. These effects of 6-OH-DA are due to either a rapid depletion of readily available noradrenaline stores in the adrenergic nerve endings, or to a rapid damage of the adrenergic nerve terminals. Results are compatible with the assumption that eserine produces a general sympathetic activation in the rat.—*Journal abstract.*

1986. Vedernikov, Y. P. (Inst. of Plant & Animal Ecology, Sverdlovsk, USSR) **The influence of single and chronic morphine administration on some central effects of amphetamine and apomorphine.** *Psychopharmacologia*, 1970, Vol. 17(4), 283-288.—Acute toxicity of morphine did not differ in aggregated and nonaggregated mice. Morphine in doses of 5, 10, 20, 40, 80 mg/kg did not influence amphetamine group toxicity. Injections of morphine increased the occurrence of amphetamine stereotypy and prolonged the duration of stereotypy caused by amphetamine and apomorphine in intact rats, but failed to prolong the duration of the stereotypy in rats tolerant to morphine.—*Journal abstract.*

1987. Villablanca, J. & Riobó, F. (U. Chile, Santiago) **Electroencephalographic and behavioral effects of harmaline in intact cats and in cats with chronic mesencephalic transection.** *Psychopharmacologia*, 1970, Vol. 17(4), 302-313.—Studied 4 chronically implanted freely moving intact cats, 5 chronic cats with complete mesencephalic transection, and 6 flaxedil immobilized cats for EEG and behavioral effects of threshold doses of harmaline (2-3 mg/kg). The drug induced motor activation, tonic postural and gait abnormalities, tumor, abnormal facial expression, crying, and neuro vegetative phenomena in intact and decerebrate cats. The drug induced intermittent or continuous hypersynchrony, most predominant over visual areas. (17 ref.)—P. Federman.

1988. Webster, W. R. (Monash U., Neuropsychology

Lab., Clayton, Victoria, Australia) **Auditory habituation and barbiturate-induced neural activity.** *Science*, 1969(May), Vol. 164(3882), 970-971.—The finding that barbiturates abolish habituation decrements in auditory evoked potentials has been interpreted as being caused by removal of the influence of the reticular formation. In 2 experiments with 5 cats, it was found that similar changes in the medial geniculate are produced by barbiturates without any intervening habituation, suggesting that refractory processes have been confused with habituation. (20 ref.)—*Journal abstract*.

1989. Whitney, Glayde D., Craig, Daniel J., Hanly, W. Carey, & Batson, Paul Y. (Holloman Air Force Base, 6571st Aeromedical Research Lab., Alamogordo, N.M.) **Effect of injected pargyline upon operant avoidance in the monkey.** *USAF ARL Technical Report*, 1969(Oct), No. 69-12, 14 p.—Examines the possible use of pargyline-HCl as a possible therapeutic agent in the treatment of decaborane intoxication. Each of 5 monkeys was given a single ip injection of buffered suspension of pargyline, the dosage being equivalent to 45 mg. pargyline-HCl/kg of body weight. Ss' behavior was evaluated for 4 days following injection on a concurrent free-operant avoidance schedule with 2 superimposed discriminated avoidance tasks. Pargyline exposure resulted in a significant ($p < .02$) reduction in response rate on the free-operant avoidance schedule, and a decrease in response latency ($p < .01$) on a discriminated avoidance task with a visual cue. On a discriminated avoidance task with an auditory cue, Ss displayed a reduction in response latency, but the effect did not reach the .05 level of significance. In no cases were pargyline-induced changes in behavior of sufficient magnitude to affect the efficiency of shock avoidance. It is concluded that the effect of pargyline on these behaviors is quantitatively slight in comparison to the effects of decaborane recorded in the literature, and that behavioral disruption from pargyline itself need not be the major consideration in decisions relevant to its therapeutic use for decaborane induced behavioral intoxication. (17 ref.)—*Journal abstract*.

1990. Wilson, W. S. (Yale U., Medical School) **The effects of phenobarbitone, leptazol, dexamphetamine, Iproniazid, Imipramine, LSD, chlorpromazine, reserpine and hydroxyzine on the in vivo levels of adenine nucleotides and phosphocreatine in the rat brain.** *British Journal of Pharmacology*, 1969(Jul), Vol. 36(3), 448-457.—Used enzymic and ion-exchange chromatographic analyses to measure adenosine triphosphate (ATP), diphosphate (ADP), and monophosphate (AMP) in brain extracts from male Wistar rats treated with a wide range of centrally acting drugs. Phosphocreatine (PC) was assayed by the acid molybdate method. An anesthetic dose of phenobarbitone caused an increase in brain levels of ATP and PC, and a reduction in ADP and AMP. A convulsant dose of leptazol gave rise to opposite effects. Subanesthetic (hypnotic) and subconvulsive doses of the 2 drugs, respectively, produced no alterations in brain nucleotide levels. Dexamphetamine, LSD, and hydroxyzine caused no changes in brain levels of the adenine nucleotides. Iproniazid and imipramine caused slight increases in the ATP level and ATP/ADP ratio, respectively. Chlorpromazine failed to give rise to any effect in the nucleotides 3 hr. after administration, but produced a rise in brain ATP after 6 hr. Reserpine caused a fall in the ATP/ADP ratio 6 hr. after injection. Results indicate that some psychotropic drugs cause small changes in the brain ATP/ADP ratio but do not

support claims that such changes correlate closely with the behavioral effects of these drugs. (38 ref.)—*Journal abstract*.

1991. Winters, Wallace D., et al. (U. California, Medical School, Los Angeles) **Reticular multiple unit activity during a progression of states induced by CNS excitants: III. Electroencephalography & Clinical Neurophysiology**, 1969(Nov), Vol. 27(5), 514-522.—Recorded the EEG, gross behavior, and multiple unit activity during the continuous progression of states induced by amphetamine (d-, and meth-), LSD-25, mescaline, gamma-hydroxybutyrate, pentylenetetrazol, or phencyclidine. The drugs appear to fall within a pattern of progressively increasing excitatory states. The least active agents induce only the initial phase. The more potent agents transcend these initial phases and induce generalized seizures. The reticular multiple unit activity increased slightly during the initial 2 phases; then following gamma-hydroxybutyrate the basal level fell progressively while the fluctuation rose markedly, whereas following pentylenetetrazol the multiple unit activity progressively increased. During the generalized seizures the unit activity was markedly elevated in both of these groups; then the unit activity fell during the brief period of postictal depression followed by a return of each drug group to the unit activity levels noted during the pre seizure state. (French summary) (19 ref.)—*Journal summary*.

CARDIOVASCULAR PROCESSES

1992. Bol'shov, V. M. & Smirnov, V. I. **Ustroistvo dlya beskontaktnoi registratsii vennogo pul'sa.** [Apparatus for registration of venous pulse without mechanical contact.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 65-66.—Describes the basic design and principle of action of the apparatus, which utilizes the volume principle for recording the oscillations of the venous walls.—I. D. London.

1993. Filatov, A. I., Pashkovskii, E. V., & Tsybul'yak, G. N. (Kirov Military-Medical Academy, Leningrad, USSR) **Ob izmeneniyakh mikrotsirkulyatsii v golovnom mozgu pri ostroi krovopote i dlitel'noi gipotenzii.** [On changes in cerebral microcirculation in acute blood loss and prolonged hypotension.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 20-23.—31 dogs were used in a morphological, physiological, and biochemical study. Under these conditions the pial arteries dilated, with relative degree of dilatation a function of arterial width. The dilatation of the pial arteries failed to compensate for the disorders of cerebral circulation, as seen in the marked disturbances of carbohydrate metabolism which ensued and in the slowing down of EEG rhythm—effects which did not disappear even after adequate repletion of blood loss and restoration of the morphological picture of microcirculation.—I. D. London.

1994. Gordienko, N. T., Zorin, A. B., Masterkova, N. A., & Verseneva, N. I. **Vnutriserdechnyi mikrofon v diagnostike zabolovaniy serdtsa i krupnykh sosudov.** [Intracardiac microphone in the diagnosis of diseases of the heart and major vessels.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 250-254.—Describes a device for intracardiac phonocardiography.—I. D. London.

2005. Yarullin, Kh. Kh. **Vozmozhnosti regionalnoi reoentsefalografii dlya vyyavleniya lokal'nykh izmenenii krovoobrashcheniya mozga**. [Possibilities of regional rheoencephalography for disclosure of local changes in cerebral circulation.] In V. V. Parin (Ed.), *Sovremennye pribory i tekhnika fiziologicheskogo eksperimenta*. (See PA, Vol. 45:Issue 2) 240-247.—Examines methods of recording rheoencephalograms (REGs), and the results of studies utilizing synchronous recording of REGs from 4 areas of the head. Data of REG and angiography are compared.—I. D. London.

ENVIRONMENT & STRESS

2006. Agadzhanian, N. A., Voronin, L. G., & Goroyan, G. P. (Moscow State U., USSR) **Vliyaniye rezkikh stepenei kislorodnogo golodaniya na skorost' vosstanovleniya tsepnnykh dvigatel'nykh uslovnykh reflektsov**. [Influence of sharp degrees of oxygen hunger on speed of restoration of chain motor conditioned reflexes.] *Zhurnal Vysheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 42-47.—Investigated, using 24 white rats, (a) speed of restoration of chain motor CRs after the action of different degrees of hypoxia, and (b) relationship between rate of development of O_2 insufficiency and degree of disturbance of the "complex analytico-synthetic activity of the cerebral cortex"—after "raising" the S in a barochamber to the height of 12,000 m (2, 25, and 150 m/sec), keeping the S at this height ("reserve-time"), and "raising" it to a critical height ("altitude-ceiling"). After being raised at great speeds (25 and 150 m/sec), a more prolonged period of inhibition of both CR and UCR reactions was observed, and the period of complete restoration of the complex system of motor CRs extended for 1, 2, and more days. Subjecting the Ss in the barochamber to high degrees of rarefaction was accompanied by a considerable disturbance of reactions to the inhibitory CS employed (flashing light). The number of adequate disinhibiting reactions dropped

after acute hypoxia by 2-3 times with simultaneous increase in the number of negative inadequate reactions. With increase in speed of decompression, the altitude ceiling was raised, while reserve time was reduced. The greatest disturbances after hypoxia were observed in the links of the chain that were maximally remote from the UCR—a fact which is taken as evidence for the disturbances of, above all, "the analytico-synthetic activity of the cerebral cortex."—*I. D. London.*

2007. Aleksandrovskaya, M. M. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Morfologicheskie korrelyaty funktsional'nykh sdvigo v tsentral'noi nervnoi sisteme porezul'tatom obsledovaniya gl'io-neironal'nykh sootnoshenii.** [Morphological correlates of functional changes in the central nervous system according to the findings of research into glioneuronal relationships.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 156-161.—Employed mice both subjected and not subjected to the action of an ultra-high-frequency electromagnetic field to determine the reasons for the activation of neuroglial cells (the astrocytes) after exposure to "weak nonspecific altering agents," without the initiation of a pathological process in the brain, most neurons remaining intact. Following exposure to an ultra-high-frequency field, an intensification of the inhibitory processes was observed with depression of CRs and acceleration of their extinction. A few neurons were found to suffer reversible changes in the form of swelling and hyperchromatosis. Astrocytic reaction to such exposure, however, was pronounced and was indicative of functional changes in the CNS. "The reactions observed in the neuroglia and in the glioneuronal relationships in the brain are a manifestation of a single nonspecific reaction bearing an adaptive character." Activation of the astrocytes is an expression of nonspecific reactions in the brain in the presence of induced inhibitory states and may be viewed as a correlate of "protective-defensive inhibition."—*I. D. London.*

2008. Delini-Stula, Alexandra. (Research Lab. of J. R. Geigy S. A., Basel, Switzerland) **The development and the extinction of hyperthermia induced by conditioned avoidance behavior in rats.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 213-218.—Observed hyperthermia at the end of each conditioning session in 15 male albino Wistar rats trained to avoid electric shocks by jumping on a platform. The temperature rise was also observed after the conditioned behavioral response was well established and was elicited even in the absence of shocks. There was no tendency for the hyperthermia to diminish over the course of 9 extinction sessions. (15 ref.)—*Journal abstract.*

2009. Gagoshidze, N. Sh., et al. (State U., Tbilisi, USSR) **Vliyaniye peremennogo magnitnogo polya nizkoi chastoty na vyrabotku elektroboronitel'nykh uslovnykh refleksov u belykh kry.** [Influence of an alternating low-frequency magnetic field on elaboration of electrode defensive conditioned reflexes in white rats.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 172-173.—10 Ss were exposed to the action of an alternating low-frequency magnetic field immediately before the CR experiment; 9 served as controls without such exposure. Under the influence of such a field, elaboration of an electrode defensive CR to light was accelerated.—*I. D. London.*

2010. Maidanova, N. V. (Medical Inst., Zaporozhsk,

USSR) **Aktivnost' transketolazy pecheni i eritrotsitov krysa pri vozdeistvii zvuka.** [Hepatic and erythrocytic transketolase activity in rats under the action of sound.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(2), 47-49.—113 Ss were subjected for different periods of time (1/2, 1, 2, 5 hr.; 2, 5, 38, 90, and 130 days, 5 hr. daily) to the action of sound (94-96 db., 2000 cps). Hepatic transketolase activity declined progressively as the time of auditory stimulation lengthened from 1/2-2 hr. In the course of auditory stimulation over a 38-day period, the observed effect weakened. With more protracted stimulation (90, 130 days), the activity of the enzyme fell off by 2 and 4 times, respectively. Decline of erythrocytic transketolase activity was detected only after 130 days of auditory stimulation.—*I. D. London.*

2011. Maizelis, M. Ya., et al. (Inst. of Normal & Pathological Physiology, Moscow, USSR) **Vliyaniye trenirovki k vysotnoi gipoksii na intensivnost' sinteza belka v golovnom mozgu i rezistentnost' zhitovnykh k sudorozhnykh faktoram.** [Influence of training for inurement to high-altitudinal hypoxia on intensity of protein synthesis in the brain and on the resistance of animals to factors leading to convulsions.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(1), 28-30.—128 rats were used to study the influence of intermittent exposure to simulated high-altitudinal hypoxia (up to 40 days) on (a) protein synthesis (intensity of methionine-S³⁵ incorporation) and nucleic acid levels in the cerebral cortex, brainstem, and hypothalamus, and (b) the reaction of the Ss to the action of convulsive agents, e.g., 70 mg/kg corazol (pentylene tetrazol, audiogenic stimuli). During the process of inurement, protein synthesis was intensified, especially in the cerebral cortex, RNA level in the cortex rose, and the resistance of the Ss to the action of convulsive agents increased.—*I. D. London.*

2012. Mikhailova, L. V. & Byshevskii, A. Sh. (Medical Inst., Zaporozhsk, USSR) **Ugnetenie fiziologicheskoi protivovertyayushchei systemy pri dlitel'nom vozdeistvii zvuka.** [Inhibition of the physiological anticoagulatory system under the protracted action of sound.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(2), 28-32.—152 white rats were used to study the effect of sound (94-96 db., 2000 cps) for various periods of time (15 and 30 min.; 1, 2, and 5 hr.; 5 and 10 days, 5 hr. daily) on the coagulatory properties of the blood. It was shown that, 30 min. after the start of auditory stimulation, the coagulatory potential of the blood progressively increased. Subsequently, both after cessation of sound and with its continued application, a return to normality occurred, though an excessive activation of the fibrinolytic system was noted. Analogous phasic changes recurred after 2 days of application of sound. It is suggested that the observed inhibition of the anticoagulatory system, following long-term application of sound, results from its exhaustion due to its periodic activation in the course of the application of sound.—*I. D. London.*

2013. Ott, John. (Environmental Health & Light Research Inst., Sarasota, Fla.) **Responses of psychological and physiological functions to environmental radiation stress: II.** *Journal of Learning Disabilities*, 1968(Jun), Vol. 1(6), 348-354.—Examines the current research regarding the possibility of harmful radiation being emitted from TV sets, the tired child syndrome, and other aspects of man-made radiations.—*Journal abstract.*

GENETICS

2014. **Franck, Dierk.** (U. Hamburg, W. Germany) **Verhaltensgenetische Untersuchungen an Artbasarden der Gattung Xiphophorus (Pisces).** [Genetics of interspecific behavioral differences in Poeciliid fishes of the genus Xiphophorus.] *Zeitschrift für Tierpsychologie*, 1970(Feb), Vol. 27(1), 1-34.—The genus has 8 species. A complete record of the behavior potential of sexual and aggressive behavior pattern has been made; social isolation has been used with males. All F₁ hybrids displayed distinct behavior patterns of maternal and/or paternal origin. Sometimes an intermediate behavior manifestation occurred. A special analysis was made of *X. helleri* and *X. montezumae*. The behavior patterns "backing from behind" in *helleri* is inherited on a polygenic basis, the same is true for "sword-bending" in *montezumae* and most likely also for "frontal position" in *montezumae*. All 3 patterns are inherited independently. (46 ref.)—*K. E. Grossmann.*

2015. **Guthrie, R. D.** (U. Alaska) **Senescence as an adaptive trait.** *Perspectives in Biology & Medicine*, 1969(Win), Vol. 12(2), 313-324.—Proposes a model for the control of senescence by selection within a population. Opposing selection pressures acting to increase and to decrease its expression maintain a species-characteristic mode of expression of the trait. Disequilibrium of these pressures results in directional selection. Average longevity can be viewed as: (a) prereproductive life, (b) time between litters, and (c) number of litters. A balance of selection pressures within each category, as well as interactions among them, is postulated. (24 ref.)—*J. Crabbe.*

2016. **McKusick, Victor A.** (Johns Hopkins U., Medical School) **On lumpers and splitters, or the nosology of genetic disease.** *Perspectives in Biology & Medicine*, 1969(Win), Vol. 12(2), 298-312.—Presents a theoretical discussion of pleiotropism and genetic heterogeneity as the 2 principles underlying classification. Methods for distinguishing between the 2 are discussed; practical difficulty is emphasized. Numerical tabulation of known Mendelian traits by mode of inheritance is presented for man and mouse. (40 ref.)—*J. Crabbe.*

2017. **Record, R. G., McKeown, Thomas, & Edwards, J. H.** (U. Birmingham, England) **An investigation of the difference in measured intelligence between twins and single births.** *Annals of Human Genetics*, 1970(Jul), Vol. 34(1), 11-20.—Mean verbal reasoning scores recorded in the 11+ examination for Birmingham, England, multiple births between 1950-1957 were 95.7 for 2164 twins and 91.6 for 33 triplets. The mean for 48,913 single children born between 1950-1954 was 100.1. The low scores of twins are not explained by differences from single births in their distributions by maternal age and birth order or by birth weight and duration of gestation. They are also not accounted for by the increased risks associated with monozygosity (assessed by comparison of like- and unlike-sex twins) or with delivery of the 2nd twin. Taken together, these observations, like the previous ones on single births, suggest that variation in experience before and during birth has little influence on measured intelligence and that the explanation of the large difference between twins and single children must be sought in the postnatal environment. There were 148 twins whose co-twins were stillborn or died within 4 wk. after birth; their mean score was 98.8, only a little lower than that of single

births (99.5) standardized to the maternal age and birth rank distribution of twins. From this evidence it is concluded that the handicapping of twins, reflected in their low verbal reasoning scores, is due to postnatal rather than prenatal influences. Conclusions are based only on those children who took the 11+ examinations. (16 ref.)—*S. G. Vandenberg.*

2018. **Smith, Charles.** (U. Edinburgh, Scotland) **Heritability of liability and concordance in monozygous twins.** *Annals of Human Genetics*, 1970(Jul), Vol. 34(1), 85-91.—Results from Falconer's heritability of liability model were revised, eliminating 2 sources of bias. The results are graphed for convenient usage, and in the absence of environmental similarities among relatives can apply to all kinds of relatives. Confidence levels for the heritability (or correlation) estimates can also be read directly off the graph. The results also apply to concordance rates in monozygotic (MZ) twins. They show that, in the absence of environmental similarities, concordance rates for a disease in MZ twins will only be high if the heritability is very high. Thus, a low concordance rate in MZ twins cannot be taken to prove that genetic factors are not important in the predisposition to a disease.—*S. G. Vandenberg.*

2019. **Weyl, Nathaniel.** (4201 S. Ocean Blvd., Delray Beach, Fla.) **Some possible genetic implications of Carthaginian child sacrifice.** *Perspectives in Biology & Medicine*, 1968(Fal), Vol. 12(1), 69-78.—Sacrifices were largely of 1st-born children of the ruling classes. Hence, to the extent that 1st-born intellectual superiority is genetically determined, the Punic gene pool would have been impoverished. Briefly discussed is the literature relevant to 1st-born superiority and that regarding assessment of relative weights of genetic and environmental contributions to intelligence. (16 ref.)—*J. Crabbe.*

PERSONALITY CORRELATES

2020. **Balástiková, Blanka.** **Genetické aspekty aspiračních reakcí.** [Genetic aspects of aspiration responses.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(1), 15-20.—Studied the effect of constitutional factors on the level of aspiration of 62 pairs of twins (median age, 8.11) in an achievement experiment in which Ss built towers with blocks. Ss included 29 pairs of monozygotic twins and 11 pairs of dizygotic twins of different sexes. The measure of correspondence between the twins was determined by computing correlation coefficients. Findings show a greater similarity of goal discrepancy in identical twins than in fraternal twins, suggesting a certain influence of determiners in the level of aspiration. (Russian summary)—*English summary.*

2021. **Giannitrapani, Duilio.** (Michael Reese Hosp., Inst. for Psychosomatic & Psychiatric Research & Training, Chicago, Ill.) **EEG average frequency and intelligence.** *Electroencephalography & Clinical Neurophysiology*, 1969(Nov), Vol. 27(5), 480-486.—An investigation of the relationship between the average frequency of the EEG and WAIS scores indicated a strong relationship between IQ and average frequency asymmetries in left and right homologous areas. Ss were 18 volunteers, aged 21-45. The correlations were higher in the posterior areas and for Performance IQ. A composite score of all EEG areas tested showed for the thinking condition a Spearman rho with Verbal IQ of .59, with Performance IQ of .78, and with Full IQ of .72. Alpha

index correlations were also higher during the thinking conditions and Performance IQ. (French summary) (28 ref.)—*Journal summary*.

2022. Koelega, Henry S. (U. Utrecht, Psychological Lab., Netherlands) **Extraversion, sex, arousal and olfactory sensitivity.** *Acta Psychologica, Amsterdam*, 1970(Sep), Vol. 34(1), 51-66.—In a group experiment on olfactory sensitivity a hypothesis derived from a theory by Eysenck, predicting that introverts manifest a higher sensitivity than extraverts, and a hypothesis offered by D. M. Broverman, E. L. Klaiber, Y. Kobayashi, and W. Vogel, predicting that females are more sensitive than males, were tested. Results did not support Eysenck's hypothesis; introvert males appeared to be less sensitive than the other 3 subgroups, whereas Broverman's hypothesis was only slightly supported. In Exp. II with individual testing both male and female extraverts were more sensitive than the introverts. It is suggested that differences between extraverts and introverts with respect to diurnal variations in arousal might have caused these unexpected findings. However, Exp. III did not corroborate this suggestion; introvert males again showed a poor olfactory capacity; females manifested a greater olfactory acuity than males, especially in the morning. (31 ref.)—*Journal abstract*.

2023. Vanderpool, John P. & Barrat, Ernest S. (505 Guinevere Dr., San Antonio, Tex.) **Empathy: Towards a psychophysiological definition.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 464-467.—14 psychiatric residents listened to taped patient interviews while their responses were recorded. Empathy scores were determined by comparing S's answers to the Emotions Profile Index and Allport-Vernon-Lindzey Scale of Values with the patient's answers to these tests. S's who showed low heart rate acceleration, greater initial skin response to the interview, and higher basal skin resistance did best on the empathy scores. Results strongly suggest that there are physiological correlations to desirable psychotherapist traits, i.e., empathy, genuineness, and warmth. (17 ref.)—*Journal summary*.

NUTRITION & GASTROINTESTINAL PROCESSES

2024. Mayer, Jean. (Harvard U., Center for Population Studies) **Some aspects of the problem of regulating food intake and obesity.** *International Psychiatry Clinics*, 1970, Vol. 7(1), 255-334.

ANIMAL PSYCHOLOGY

2025. Iwao, S. & Wellington, W. G. (Kyoto U., Agricultural Coll., Japan) **The influence of behavioral differences among tent-caterpillar larvae on predation by a pentatomid bug.** *Canadian Journal of Zoology*, 1970(Jul), Vol. 48(4), 896-898.—Studied the larvae of western tent caterpillars, *Malacosoma californicum pluviale* (Dyar), during 2 instars. Their behavior was rated as most active (Type I), active but less well oriented (Type IIa), and sluggish and disoriented (Type IIb). The larvae were marked and 3 of each type exposed to predators during the 4th and 5th (ultimate) instars. Type I larvae (the most active larvae) were most successfully attacked in the 4th instar while Type IIb (the sluggish larvae) were most readily devoured during the 5th instar when the movements of these larger larvae were more conspicuous to the predator than those of the smaller 4th

instar larvae. "Hitherto, theories of predator-prey or parasite-host interactions have been mainly concerned with numerical relationships, but they obviously should consider the role of population quality as well."—J. M. Roberts.

2026. Karandeeva, O. G. **Osobennosti povedeniya v nevole i dressirovka del'finov.** [Features of dolphin behavior in captivity and their training.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 55-58.—Presents a survey of the non-Soviet literature (chiefly the American), from which it is concluded that the suitability of dolphins as experimental animals is of a high order.—I. D. London.

2027. McDonald, Dennis L. (Duke U.) **Bird orientation: A method of study.** *Science*, 1968(Aug), Vol. 161(3840), 486-487.—Describes a psychophysical technique enabling precise determinations of the accuracy with which a bird can orient itself using an artificial sun as the only reference point. Data indicate that a pigeon can detect angular displacement as little as 3.4°.—*Journal abstract*.

2028. Westlake, G. F. & Kleerekoper, H. (Texas A & M U., Inst. of Life Science) **Evidence for a memory process in the turning behavior of free swimming goldfish.** *Canadian Journal of Zoology*, 1970(Jul), Vol. 48(4), 813-815.—Spontaneous alternation in terms of the direction of the preceding turn was studied in 6 goldfish under free-field conditions. Behavior observed in the peripheral areas of the tank was analyzed separately and showed no consistent effect of the walls of the tank on turning behavior. The correlation between size of deflection from the forward line of progression (magnitude of the turn) decreased as the time between turns increased. It is concluded that "the results of the present study provide strong evidence for the presence of a memory process in turning behavior."—J. M. Roberts.

COMPARATIVE PSYCHOLOGY

2029. Devine, James V. (U. Texas, El Paso) **Stimulus attributes and training procedures in learning-set formation of rhesus and cebus monkeys.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 62-67.—Assessed the importance of visual capabilities and training procedures in learning-set (LS) comparisons of species with 8 rhesus and 8 cebus monkeys. 2 levels of stimulus attributes, chromatic and achromatic stimuli, and 2 procedural levels, 6 trials/problem and an adjustable trials/problem procedure, were combined. The ranking of the species on rate of approach to a criterion based on Trial 2 performance differed according to the condition of LS training. Asymptotic performance (percentage correct responses on Trial 2) did not differ. Stimulus attributes and training procedures were significant factors in establishing LS ($p < .005$). Results are considered to be incompatible with the notion that LS performance leads to a consistent ordering of rhesus and cebus monkeys according to their phylogenetic development. (22 ref.)—*Journal abstract*.

2030. Oliverio, Alberto. (U. Sassari, Italy) **Species and strain differences in relation to discriminative shuttlebox avoidance learning.** *Communications in Behavioral Biology*, 1969(Jul), Vol. 4-A(1-3), 7-12.—Performed 4 experiments with 16 male inbred DBA/2J mice, BALB/c, and A/J mice, and albino Wistar rats. Ss trained in a shuttlebox with pulsed tone as CS achieved a

large transfer of training when shifted to a pulsed light, while Ss trained with discriminative compartmental CSs (pulsed tone in the left compartment and pulsed light in the right) showed a sensible decrement of performance during reversal. Ss receiving light as CS in the right compartment and shock in absence of CS in the left performed very poorly, while high levels of responding were attained by albino rats. The importance of spatial location when discriminative compartmental CSs are used in 2-way tasks is discussed in relation to the role of genetic traits in avoidance learning. Evidence suggests that a 2-way task is learned as if formed by 2 different tasks. The use of stimuli in different sensory modalities, characterized by similar temporal patterns, should determine whether learning of a 2-way task responds to 2 different processes and if this difference is due to the importance of spatial locations rather than to a dissimilarity of the systems which represent at the central level different steady stimuli.—*Journal abstract.*

2031. Raphael, Dana. (666 Sturges Highway, Westport, Conn.) **Uncle rhesus, auntie pachyderm, and mom: All sorts and kinds of mothering.** *Perspectives in Biology & Medicine*, 1969(Win), Vol. 12(2), 290-297.—Discusses male and female "mothering" behavior for a variety of species including humans. To describe behavior of animals other than biological mother interacting with infant, replacement of term "aunt" by "doula" is suggested because of confusion regarding actual blood relationship. It is suggested that "doula" behavior may increase survival potential of both mother and infant. (18 ref.)—*J. Crabbe.*

NATURAL OBSERVATION

2032. Mountjoy, Paul T. & Sears, Gary W. (Western Michigan U.) **Historical note: An observation of territoriality in birds which predates scientific reports.** *Psychological Record*, 1970(Win), Vol. 20(1), 93-95.—Attention is called to a published observation of territorialism in the ostrich which preceded scientific development of the concept of territoriality by approximately 20 yr.—*Journal abstract.*

EARLY EXPERIENCE

2033. Ader, Robert & Grotz, Lee J. (U. Rochester, School of Medicine & Dentistry) **Rhythmicity in the maternal behaviour of Rattus norvegicus.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 144-150.—Under a 12-hr light-dark (LD) regimen there was a precise 24-hr rhythm in maternal behavior; the greatest amount of time with the litter occurring during the middle of the light period and the least amount of time occurring during the period of darkness. The cycle was independent of litter size and the time spent with the litter. Animals rearing litters under an LD:6 schedule also showed a 24-hr maternal behavior rhythm. Animals maintained under an LD:12 schedule but transferred to continuous light when pregnant and animals maintained for 2 generations under constant light showed a free-running maternal behavior rhythm with an approximate 24-hr period.—*Journal summary.*

2034. Dubos, René. (Rockefeller U.) **Lasting biological effects of early influences.** *Perspectives in Biology & Medicine*, 1969(Sum), Vol. 12(4), 479-491.—Specific-pathogen-free (SPF) mice, contaminated orally on the 2nd day of life with fecal matter from ordinary

mice, were lighter as infants than control (uncontaminated) SPF mice and grew to be smaller adults. Bacteria-free filtrates of such fecal matter altered tissue cultures of baby hamster kidney cells (BHK). Infected BHK cultures depressed infant and eventual adult weights of newborn SPF mice and that of their offspring. Lowered magnesium, lysine, or threonine content in dam's diet depressed growth of offspring, although the smaller offspring had a longer life expectancy. Newborn SPF mice were pooled on the 1st day of life and randomly reallocated to mothers. Marked differences in weight were recorded among litters while within-litter size differences were small.—*J. Crabbe.*

2035. Smith, F. V. & Nott, K. H. (U. Durham, England) **The "critical period" in relation to the strength of the stimulus.** *Zeitschrift für Tierpsychologie*, 1970(Feb), Vol. 27(1), 108-115.—Domestic chicks were attracted by particular combinations of auditory and visual stimuli from a distance, even when the 1st exposure took place only 10 days after hatching. Ss responded until 28 or 29 days of age. Ss were able to discriminate between familiar and novel stimulus combinations. They responded better if reared in isolation; this was not true for Ss exposed to the stimuli 1, 2, or 3 days after hatching. Isolated ducklings approached the stimulus combination better 1 or 2 days after hatching than socially reared ones. Isolated chicks and ducklings approached equally well, but socially reared chicks were better than socially reared ducks. On the discrimination test mallard ducklings were inferior to the chicks, which may be due to some innate restriction of preferences in the less domesticated species.—*K. E. Grossmann.*

2036. Suomi, Stephen J., Harlow, Harry F., & Domek, Carol J. (U. Wisconsin, Regional Primate Research Center) **Effect of repetitive infant-infant separation of young monkeys.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 161-172.—In view of several methodological difficulties inherent in mother-infant separation, an alternative procedure, that of repetitive, short-term, infant-infant separations, is proposed. Results from 3 studies employing this procedure with 4 young rhesus monkeys indicate that: (a) each short-term infant-infant separation produced behavior patterns similar to those exhibited by infants separated from their mothers; (b) Ss did not adapt to the separation procedure, but rather continued to show similar reactions to each successive separation; and (c) a cumulative effect of repetitive infant-infant separations was an arrest of maturation of social development in the monkey Ss. (21 ref.)—*Journal abstract.*

INSTINCTS

2037. Cole, J. E. & Ward, J. A. (Illinois State U.) **An analysis of parental recognition by the young of the cichlid fish, Etroplus maculatus (Bloch).** *Zeitschrift für Tierpsychologie*, 1970(Mar), Vol. 27(2), 156-176.—The young do not recognize their parents; they react to the flicker of the dark pelvic fins of their parents. No chemical attractants were found. The fry consistently selected 1 of 2 models in which pelvic fin flickering was mechanically controlled. Color and body movement did not appear to have been of any importance. There was no improvement of recognition of the parents by the fry within the 1st 12 days of free swimming. (26 ref.)—*K. E. Grossmann.*

2038. Wehner, Rudiger & Menzel, Randolph. (U.

Zurich, Switzerland) **Homing in the ant *Cataglyphis bicolor*.** *Science*, 1969(Apr), Vol. 164(3876), 192-194.—Studied *Cataglyphis bicolor*, a common ant of desert areas of northern Africa and southwest Asia. It was found that this species orients to the sun and to visual patterns of the environment and that these mechanisms can be separated. Foraging ants (hunters) orient to terrestrial cues as long as possible, and only after these have become ineffective, switch over to the menotactical sun orientation. In digging ants however, the visual knowledge of locality is significantly inferior to that of hunters. Diggers vary considerably in size, but hunters belong to the largest size group. The largest and smallest ants orient differently toward black and white areas and stripe patterns.—*Journal abstract*.

2039. Weintraub, Joel D. (California State Coll., Fullerton) **Homing in the lizard *Sceloporus orcutti*.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 132-137.—*Sceloporus orcutti* individuals will come back to their capture areas after displacement; adult males returned from distances up to 215 m. Males returned from greater distances than females, and older animals did better than younger ones. The homing response is present throughout the year and may occur in nonreturnees displaced again. Visual cues of the capture area seemed to be important in the homing response.—*Journal summary*.

MOTIVATION & EMOTION

2040. DeSisto, Michael J. & Huston, Joseph P. (Tufts U.) **Effect of territory on frog-killing by rats.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 179-184.—The latency of frog-killing by male hooded rats varied as a function of practice and familiarity of the environment. Rats killed frogs more quickly in their home cages than in strange cages, where exploration preceded killing. With practice, rats became more efficient killers. In established groups of 3 rats, only 1 rat did the killing, indicating that dominance relationships had developed. Rats taken from home individual cages and placed in strange group cages of 3 explored the environment and fought with other rats before killing the frog. Some rats killed up to 30 frogs in succession before satiation and resumed frog-killing the next day. It is concluded that because frog-killing does not satiate readily, it may be a useful response in studying the motivation of aggressive behavior.—*Journal summary*.

2041. Gallup, Gordon G., Creekmore, Harry S., & Hill, William E. (Tulane U.) **Shock-enhanced immobility reactions in chickens: Support for the fear hypothesis.** *Psychological Record*, 1970(Spr), Vol. 20(2), 243-245.—Gave 22 6-wk-old Rhode Island Red domestic chickens either electric shock or no shock prior to manual restraint. Ss receiving preinduction shock remained immobile appreciably longer than Ss given no shock. Results support the notion that fear is what underlies hypnotic or immobility reactions in animals.—*Journal abstract*.

2042. Gruenau, Steven & Kessler, Clemm C. (U. Oklahoma, Medical Center) **Differential activity in rats as a function of deprivation, stimulus change, and recording method.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 59-64.—Studied the effects of stimulus changes on activity in 20 food-deprived and 20 non-deprived adult male Long-Evans rats using a photo-relay method, direct observation, and bar-press rate. Differences in activity as measured by the photo-cells and

differences in bar-presses were significant ($p < .001$) for stimulation, deprivation, and the interactions. Ss in the stimulus change groups had the highest activity counts, their most frequent single behavior being exploration. Results confirm the utility of the photo-relay system of measurement, demonstrate that stimulus change differentially affected the activity of deprived and non-deprived Ss, and support the conclusion that stimulation sensitized Ss to its internal state to which it then reacted. (17 ref.)—*Journal abstract*.

LEARNING

2043. Butler, C. G., Fletcher, D. J., & Watler, D. **Hive entrance finding by honeybee (*Apis mellifera*) foragers.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 78-91.—Success in reorientation to a change in the position of the hive entrance seemed to be related to amount of confusion and number of bees making the change. When the new entrance was found bees started dispensing Nassanoff gland scent. The scent and visual landmarks both appeared to be used by the bees in learning the new way into the hive.—G. Greenberg.

2044. Chesler, Phyllis. (Richmond Coll., City U. New York) **Maternal influence in learning by observation in kittens.** *Science*, 1969(Nov), Vol. 166(3907), 901-903.—Reports that 6 kittens who observed their mothers perform a stimulus-controlled response (lever pressing to a visual stimulus for food) acquired and discriminated that response sooner than 6 Ss who observed a strange female cat's performance. 6 other Ss exposed to a trial and error condition never acquired the response. Initial differences in attentiveness to demonstrator performances disappeared by the 2nd day. "Altruism" (food sharing) and other forms of social behavior were exhibited by both mother and stranger demonstrators.—*Journal abstract*.

2045. Devine, James V. & Ivens, John R. (U. Texas, El Paso) **Acquisition of the oddity concept in the chimpanzee.** *USAF ARL Technical Report*, 1969(Oct), No. 69-16, 29 p.—Analyzed response regularities of 2 naive chimpanzees in the acquisition of 3-position, 1-trial oddity problems. Ss reached asymptotic levels of 85-90% correct responding after 2400 trials. 2 response regularities were discerned and recorded; the most reliable regularity was repeated responding to 1 position and the 2nd regularity was object discrimination responding. Both regularities were observed to shift over trial blocks to different positions and stimuli; in addition both regularities were observed to diminish over trial blocks. Evidence was also found for relational oddity responding early in the acquisition process. Analysis of errors for each of 66 stimulus combinations (configurations) suggest interaction between physical properties of stimuli used, and Ss' acquisition of the oddity concept. (22 ref.)—*Journal abstract*.

2046. Groves, Philip M. & Thompson, Richard F. (U. Colorado) **Habituation: A dual-process theory.** *Psychological Review*, 1970(Sep), Vol. 77(5), 419-450.—Presented a dual-process theory of response plasticity to repeated stimulation. 2 hypothetical processes, 1 decremental (habituation) and 1 incremental (sensitization), are assumed to develop independently in the CNS and interact to yield the final behavioral outcome. Behavioral experiments are presented, using both the hindlimb flexion reflex of acute spinal cat and the acoustic startle response of intact rat, which are consistent with this

theory. Neurophysiological experiments indicate that the 2 processes have separate and distinct neuronal substrates. The dual-process theory and other current theories of response habituation are evaluated in terms of these and other recent findings. (6 p. ref.)—*Journal abstract*.

2048. Myers, William A. (Macalester Coll.) **Observational learning in monkeys.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 225-235.—Housed observer monkeys (1 stump-tail and 1 rhesus male) next to demonstrator monkeys (1 stump-tail and 1 rhesus male) who were conditioned to respond on a multiple reinforcement schedule whose components were fixed-ratio (FR) 32, variable-interval (VI) 3 min., and extinction 5 min. followed by an additional 30 sec. of extinction during which every response started a new 30-sec interval. After observational periods from 113-210 hr. long, during which Os could not perform the response and were given no extrinsic reinforcers, their 1st-response latencies to FR and VI were as short as the demonstrators; and their rates of responding were above preobservational base-line levels. About 8 hr. later, a temporal pattern of responding appropriate to the multiple schedule emerged, including nonemission of responses during extinction. 3 controls lacking the chance to observe did not develop typically patterned responding after 60 hr. in 1 case and, in 2 other cases, after 80 hr. during which on 2 occasions all of 50 responses were reinforced. In Exp. II, using Exp. I Ss, the stimulus lights associated with FR and VI were presented simultaneously. Ss chose 1 of the schedules by responding to 1 of the levers beneath the lights. All Ss initially chose FR. Seeing the demonstrators switch to VI, due to increases in the FR requirement, had no effect upon Os, who continued to choose FR. (19 ref.)—*Journal abstract*.

2049. Peretti, Peter O. (North Park Coll.) **Complex cognitive behavior of the rat as a result of learning sign-significate relations.** *Acta Psychologica, Amsterdam*, 1970(Sep), Vol. 34(1), 122-128.—Investigated complex sign learning in 2 female hooded rats. The signs the S had learned were randomly changed throughout runs over the total number of trials. Choice of the correct sign would direct the S to water. Results indicate that the rat is capable of establishing a cognitive relationship between a sign and a correct response.—*Journal abstract*.

2050. Richman, Charles L. (Wake Forest U.) **Effects of experimentally induced irrelevant stimuli on reversal shifts.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 69-83.—Gave 36 male hooded rats original and reversal training in a T maze. A 2 × 3 factorial design was employed with 2 levels of original training and 3 combinations of cues: Group A, odor trail, body turn, and direction relevant; Group B, body turn relevant and odor trail and direction irrelevant; and Group E, direction relevant and body turn and odor trail irrelevant. Groups' trials to original learning criterion were ordered in the following manner: Groups A, B, and E. Group A did not show the overlearning reversal effect (ORE) and Group B and E demonstrated a trend toward the ORE. It was determined that Group E did not show the ORE because 2 overtrained Ss responded at low level accuracy during overtraining. An extension of E. Lovejoy's reversal learning model was presented. (29 ref.)—*Journal summary*.

2051. Stern, Warren C. (Tufts U., Medical School) **The relationship between REM sleep and learning: Animal studies.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 249-257.

2052. Wike, Edward L. & Atwood, Michael E. (U. Kansas) **The effects of sequences of reward magnitude, delay, and delay-box confinement upon runway performance.** *Psychological Record*, 1970(Win), Vol. 20(1), 51-56.—Investigated the effects of increasing vs. decreasing amount and delay of reward in runway training and delay-box confinement in extinction using 54 male Sprague-Dawley rats. Ss with increasing amount and decreasing delay ran faster in both acquisition and extinction. Amount and delay produced patterned running in both acquisition and extinction; delay-box confinement led to patterned running in extinction. Results were related to those from previous investigations and interpreted in terms of E. J. Capaldi's aftereffects theory.—*Journal abstract*.

2053. Williams, Jon L. & Ellis, John A. (Kenyon Coll.) **The effects of delay on an established response.** *Psychological Record*, 1970(Spr), Vol. 20(2), 251-258.—Investigated the effect of varying length of delay on an established response as a function of similarity between the delay box and goal box. 32 hooded rats were reinforced with sucrose for running a V-shaped alley. During testing Ss were delayed in the maze for 5, 20, 45, and 90 sec. Each S served as its own control and received all of the delay conditions. Ss were divided into 2 groups, 1 which was delayed in a chamber similar to the goal box and 1 which was delayed in a dissimilar chamber. Contrary to the original hypothesis that Ss would start and run faster as a function of length of delay, they ran slower as a function of length of delay. Furthermore, the groups did not differ significantly. It is concluded that the delay situation was novel and elicited responses incompatible with running which therefore precluded the behavioral effects of frustration.—*Journal abstract*.

Conditioning

2054. Bastian, Chris W. & Hothersall, David. (Ohio State U., Research Center, Lab. of Comparative & Physiological Psychology) **Operant conditioning in redwinged blackbirds.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 241-246.—Describes an operant conditioning technique for use with passerine birds. 2 redwinged blackbirds were successfully conditioned to perch-hop for food reinforcement. Continuous reinforcement and fixed-ratio schedules involving substantial ratio requirements were used to maintain this response. The behavior of Ss was comparable to that of more conventional organisms working on similar schedules of reinforcement. (16 ref.)—*Journal abstract*.

2055. Farris, Howard E., Gideon, Bruce E., & Ulrich, Roger E. (Western Michigan U.) **Classical conditioning of aggression: A developmental study.** *Psychological Record*, 1970(Win), Vol. 20(1), 63-67.—2 groups of male Long-Evans hooded rats were classically conditioned to fight to previously neutral stimuli. A 2-ma shock served as the UCS. 6 Ss in 1 group were begun at age 34 days and 6 in the other were begun at age 90 days. All Ss showed development of consistent conditioned fighting. There were no significant differences in the

acquisition rate or asymptotic level of fighting of the 2 groups.—*Journal abstract.*

2056. Fukuda, Norichika. (Waseda U., Tokyo, Japan) [An experimental study of backward conditioning.] *Japanese Journal of Psychology*, 1969(Feb), Vol. 40(6), 319-329.—In 3 experiments, 313 rats were conditioned by inescapable procedure, 60 by procedure shifting from inescapable to escapable training, and 66 by instrumental procedure. Secondary properties were tested in a new learning situation in Exp. I and in an extinction situation in Exp. II and III. Results indicate that: (a) In secondary properties of backward CS in conditioning of a classical type carried out under certain trials, the hypothesis was tentatively supported. (b) In conditioning of a shifting and instrumental type, the hypothesis was supported. The stronger the instrumental conditioning, the quicker the acquisition of the properties and the higher the resistance to extinction. (22 ref.)—*English summary.*

2057. Manning, Alexander A. (U. Miami) **Discrimination and generalization as a function of caudate stimulation CS intensities in nictitating membrane Pavlovian conditioning of rabbits.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5716.

2058. Preobrazhenskaya, L. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **K voprosu o sootnositel'noi roli tonicheskogo i faznogo uslovnykh razdrzhitel'ei.** [On the relative role of tonic and phasic conditioned stimuli.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 219-226.—4 dogs were studied in order to determine (a) whether a CS elicits an effect, appropriate to it, in the presence of a state of heightened excitability in the "structures of an antagonistic reaction," or (b) whether the CS serves only as a trigger or occasion for producing a reflex, whose structure had been prepared for prospective activity, owing to the "stereotypic conditions" of the experiment. A heterogeneous stereotype was elaborated, intended to consist of defensive and alimentary halves of the experiment. On extraneous application of the alimentary CS in the defensive half of the experiment and of the defensive CS in the alimentary half, there arose in all Ss, in response to the applied stimuli, a reaction adequate to the signal-significance of the acting stimulus. The application of an alimentary instead of a defensive signal in experiments, utilizing stronger electrodermal reinforcement, was in no case accompanied by the appearance of a defensive-motor reaction. In 2 Ss, in response to the alimentary CS, applied in place of the defensive CS, secretory and alimentary-motor reactions arose, while in the others the alimentary reflex was suppressed. In no case was a defensive-motor reaction elicited in response to an alimentary signal.—*I. D. London.*

2059. Shvets, T. B. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Dinamika izmenenii znaka sdvigoĭ urovnya postoyannogo potentsiala pri zamykanii uslovnoi svyazi.** [Dynamics of changes in sign of shifts in constant potential level in closure of the conditioned connection.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 27-34.—Utilizing rabbits, the UCS was electrodermal stimulation of left forepaw; the CS was a 15-W light for 18 Ss, a 60-W light for 2 Ss, and a 100-W light for 2 Ss. There were implanted platinum electrodes in 9 Ss and nonpolarizing electrodes in 13. Surface recordings during elaboration of defensive CRs to light disclosed great variability of constant potential level with respect to sign and spatial

distribution. It is suggested that the noted changes have basically a neuronal origin, being the result of the "vector (algebraic) summation" of surface-positive and surface-negative electrical fields from different sources. The dynamics of changes in the course of elaborating a CR should reflect the vertical displacement and complex interaction of the foci of massive depolarization and hyperpolarization in the neuronal elements of the brain.—*I. D. London.*

2060. Sirotskii, V. V. (Bogomolets Inst. of Physiology, Kiev, USSR) **Proyavleniye uslovnogo refleksa na vremya u sobak v ontogeneze.** [Ontogenetic manifestation of the temporal conditioned reflex in dogs.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 166-169.—6 puppies from the same litter were Ss in an ontogenetic study (1-7 and 17-20 mo.) of the changes in rate of respiration and pulse, and level of maximal arterial pressure, in the process of elaborating a stereotype of temporal alimentary CRs in the same Ss at different postnatal ages. The CRs incorporated positive and inhibitory acoustic stimuli in sequence, with isolated action of conditioned signals for 20 sec. with 5-min intervals between them. Autonomic reactions, arising not earlier than 20 sec. before presentation of the CS, were considered as part of the reflex to time. It is suggested that the indistinctness of manifestation of the CR to time, observed in the system of alimentary CSs in puppies up to the age of 7 mo., is a characteristic aspect of their CR activity, "pointing to a not completely formed mechanism for the perception of conditioned (signal) extero stimuli acting even rhythmically on the organism."—*I. D. London.*

2061. Struchkov, M. I. (Inst. of Higher Nervous Activity, Moscow, USSR) **Pryamye i obratnye svyazi v pishchevykh uslovnykh refleksakh** [Direct and feedback connections in alimentary conditioned reflexes.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 18-26.—4 dogs were Ss, utilizing (a) usual alimentary conditioning, (b) a combination of the alimentary reflex with precedent passive raising of the hind-paw and its placement on a stand (15 cm. high) to the rear of the animal, and (c) a combination of the wink reflex with the alimentary in the order winking → food and food → winking. Both direct and feedback connections were formed in all Ss. Only those results are reported which deal with the indices of motor activity procured through EMG recordings of the extensors of the thigh and the foot of the forepaw. It is shown that the feedback connection bore a specific character and, consequently, possessed a CR nature. Direct and feedback connections were formed in combining the alimentary with the wink reflex in both orders of presentation. Feedback connections appeared regularly and were almost as resistant to extinction as were direct connections. It is concluded that the feedback connection is a quite necessary link in the elaboration and functioning of the conditioned connection which is based on the necessary assumption of the functional unity of conditioned and unconditioned stimulation.—*I. D. London.*

2062. Thor, Donald H. & Pierson, Ellery. (E. R. Johnstone Training & Research Center, Bordentown, N.J.) **Concurrent circadian periodicities: Gross activity and self stimulation with light.** *Acta Psychologica, Amsterdam*, 1970(Sep), Vol. 34(1), 67-77.—Continuously measured gross activity and frequency of change in self-illumination in 2 male hooded Long-Evans rats for 36 and 45 days. Periodicities of light-

contingent bar pressing and gross activity were both circadian and in phase. The daily bar press rate decreased to 0 in continuous light with a nonfunctional lever. Operant responding recovered with reinstatement of the contingency. Results suggest a daily requirement for light-dark stimulation and a light contingent maintenance of a periodic operant response. (24 ref.)—*Journal abstract*.

2063. Varga, M. E. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **K klassifikatsii priobretennykh dvigatel'nykh reaktsii.** [On the classification of acquired motor reactions.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 227-232.—8 dogs were Ss in a study of the features characteristic of motor reactions (spontaneous and response), observed when the same stimuli (5 clicks/sec; electrodermal stimulation of forepaw causing a distinct local flexion of the extremity) are applied in temporally different ways. Variants of the experiment: (a) only acoustic stimulus, (b) uncombined acoustic stimulus and electrodermal stimulation (pseudo-conditioning), (c) acoustic stimulus after termination of electrical stimulation (backward conditioning), and (d) acoustic stimulus before electrodermal stimulation. It was shown that in the 1st 3 variants the appearance of motor activity in response to sound was of the nature of spontaneous activity and did not increase with increase of training. Only in the 4th variant, where the motor reaction to sound was an expression of the classic defensive CR, was this activity substantially greater than spontaneous activity and was characterized by a definite degree of independence from the spontaneous, generalized activity observed in the other variants. Only when the CS preceded painful reinforcement was a specialized connection of signal significance formed—1 which was really distinguished from overall generalized activity. The observed relationship between the motor reactions in response to the application of any stimulus and the spontaneous reactions were a fine criterion for separating classical defensive CRs from other related phenomena.—*I. D. London*.

2064. Voronin, L. G. & Kozarovitskii, L. B. (Moscow State U., USSR) **Nekotorye osobennosti vyssheĭ nervnoi deyatel'nosti chernomorskogo del'fina afalliny tursiops truncatus.** [Some features of higher nervous activity in the Black Sea dolphin of the aphaline species (*tursiops truncatus*).] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(1), 233-242.—For an adult female S features of higher nervous activity were disclosed by the application of conditioning methods, i.e., the elaboration of positive and negative food-procurement CRs, their reversal, and the extinction of CR reactions. Conditioned signals were 11 kcps, 8/sec (positive), and 1/sec (differential). It was shown that a sharply expressed inertness in the nervous processes (especially the process of inhibition) was combined with their concentration and irradiation (both considerable) in the motor analyzer, and the presence of "dis-equilibration" of the nervous processes in the direction of a predominance of excitation. These features promoted the quick formation of conditioned connections and their great stability under the action of various kinds of strong extrastimuli. When a situation was difficult to handle, wide irradiation of excitation arose every time. Judging by a number of other characteristics of higher nervous activity (imitation, orienting-investigatory and playful activity, tendency to the development of incomplete reactions, ritual behavior, etc.), the dolphin is

reminiscent of other higher animals, simians in particular.—*I. D. London*.

2065. Wike, Edward L. & Atwood, Michael E. (U. Kansas) **The effects of delayed reward and delay-box confinement upon instrumental performance: A within-type design.** *Psychological Record*, 1970(Win), Vol. 20(1), 57-62.—Investigated the effects of partial delay of reward in training and partial delay-box confinement in extinction using a within-type experimental design in both training and extinction with 26 Sprague-Dawley rats. 1 alley of a Grice discriminator led to immediate reward, while the other alley led to 30-sec delay on $\frac{2}{3}$ of the trials. $\frac{1}{2}$ of Ss were extinguished with 30-sec delay-box confinements on $\frac{2}{3}$ of the trials in the former delay alley and no delay in the other alley; $\frac{1}{2}$ had no delay in either alley. In contrast to the results from between-type experiments, partial delay produced less resistance to extinction and changes in delay from training to extinction had no effect.—*Journal abstract*.

Discrimination

2066. Gay, Robert A. (U. Texas) **Experimental methodology and the contrast effect: Frequency vs magnitude.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5710.

2067. Kamil, Alan C. & Hunter, Maxwell W. (U. Massachusetts) **Performance on object-discrimination learning set by the greater hill myna (*Gracula religiosa*).** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 68-73.—4 mynas received 1000 discrimination problems in a modified Wisconsin General Test Apparatus, using 100 multi-dimensional stimulus objects. Learning set was acquired, as indicated by an asymptotic Trial 2 performance, clearly above chance. Retention of this learning set over a 150-day interval, and transfer to new objects were also found. Further experimentation was designed to obtain hypothesis estimates based upon Ss' performance. (15 ref.)—*Journal abstract*.

2068. Pokrzywinski, John. (U. Mississippi) **Presence-absence discrimination training on a line-length dimension.** *Psychological Record*, 1970(Spring), Vol. 20(2), 211-217.—Trained 3 pigeons to discriminate the presence (S+) of a horizontal line with vertical lines on each end from its absence (S-). The only effect of discrimination training was to steepen postdiscrimination generalizations gradients. 3 other Ss were trained on the same discrimination except the S+ had no end lines. Postdiscrimination generalization gradients for these Ss become much flatter and indicate an area shift, if not a peak shift. It is concluded that the total area of the figure created by the S+ with end lines was the stimulus dimension that acquired stimulus control, and not simply the line-length dimension.—*Journal abstract*.

2069. Sansone, M., Oliverio, A., Renzi, P., & Bovet, D. (U. Sassari, Italy) **Water maze discrimination learning in mice.** *Communications in Behavioral Biology*, 1969(Jul), Vol. 4-A(1-3), 115-119.—Trained inbred BALB/c and C57BL/6 mice and a noninbred Swiss albino strain in an automated Y-shaped water maze for brightness discrimination learning. 8 Ss of each strain, trained to swim towards light ("L"-procedure) during the initial learning, showed higher levels of correct choices in comparison to Ss trained to swim towards darkness ("D"-procedure). No difference between the procedures was evident during reversal training.—*Journal abstract*.

2070. Ward, Jeannette P., Yehle, Arthur L., & Doerflin, R. Stephen. (Memphis State U.) **Cross-modal transfer of a specific discrimination in the bushbaby (*Galago senegalensis*).** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 74-77.—Trained 8 adult bushbabies to discriminate intermittent stimuli with a go, no-go response in a 2-way shock-avoidance apparatus. The stimuli were either light flashes of 3/sec and 18/sec or auditory clicks of the same rates. Ss were counterbalanced in acquisition with respect to stimulus modality and stimulus contingencies within a modality. After performance of the discrimination in the 1st modality had stabilized, Ss were tested in the 2nd modality with either the same (direct transfer) or reversed (reversal transfer) stimulus contingencies for 100 trials. Performance in the transfer test of the direct transfer Ss was facilitated as compared to that of reversal transfer Ss. (21 ref.)—*Journal abstract*.

Avoidance & Escape

2071. Crosby, Ray M. & Cahoon, D. D. (Auburn U.) **A comparison of two techniques for shaping escape behavior in the operant conditioning chamber.** *Psychological Record*, 1970(Win), Vol. 20(1), 97-99.—A recently devised apparatus which facilitates escape training in the operant conditioning chamber by restricting the area of the chamber within which Ss can move was compared with traditional shaping procedures with respect to speed of acquisition of the bar press. The experimental technique is found to be more effective with respect to average acquisition time and reduction of variability among Ss. Implications of the procedure for research with negative reinforcement are discussed.—*Journal abstract*.

2072. Halff, Henry M. (U. Texas) **An application of stimulus sampling theory to latency in a shock escape situation.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5711.

2073. Scobie, Stanley R. (State U. New York, Binghamton) **The response-shock-shock-shock interval and unsignalled avoidance in goldfish.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 219-224.—Trained goldfish to swim back and forth in a shuttle tank to avoid unsignalled shocks. The response-shock interval and the shock-shock interval were always of equal duration, either 15, 30, 45, or 60 sec. Response rates varied inversely with response-shock-shock-shock interval duration, as has been found with rats. Percentage of shocks avoided was somewhat lower at the 15-sec response-shock-shock-shock interval, but otherwise did not vary systematically with changes in the interval. As the response-shock-shock-shock interval increased, Ss made increasingly more responses than necessary to avoid all shocks. Interresponse-time distributions showed that response probability rose to a maximum at about 15-25 sec. after a response, regardless of the response-shock-shock-shock interval. Thus, at the longer intervals Ss were responding too early in the response-shock-shock-shock interval to minimize response rates.—*Journal abstract*.

Reinforcement

2074. Carlisle, H. J. (U. California, Santa Barbara) **Intermittent heat as a reinforcer for rats in the cold.** *Physiology & Behavior*, 1970(Aug), Vol. 5(8), 861-

866.—Intermittent thermal reinforcement does not sustain stable schedule performance of rats in a cold environment when a single reinforcement follows the schedule run. The contribution of the response situation to this problem was examined in 2 experiments with 5 male Sprague-Dawley rats each. A 1-min access to radiant heat reinforcement was provided on a CRF schedule contingent upon responding on a fixed-ratio schedule on either the same or a different lever. Response output was considerably augmented when Ss were required to work on 1 lever to gain access to heat on a 2nd lever. Response output was further improved when Ss worked on a fixed-ratio schedule to gain access to heat on the same lever. Results indicate that a change in the response situation, per se, is not a necessary condition for the improvement of schedule performance with thermal reinforcement. The density of reinforcement appears to be a more important variable.—*Journal abstract*.

2075. Melvin, Kenneth B. & Anson, John E. (U. Alabama) **Image-induced aggressive display: Reinforcement in the paradise fish.** *Psychological Record*, 1970(Spr), Vol. 20(2), 225-228.—A mirror presentation and the ensuing species-specific aggressive display reinforced the response of swimming through an aperture in paradise fish. Learning and extinction curves were shown with this type of reinforcement; however, noncontingent mirror presentations did not maintain performance. A declining trend in operant swimming performance with repeated image/display reinforcements reflected some habituation of the display.—*Journal abstract*.

Reinforcement Schedule

2077. Angle, Hugh V. (U. Missouri, Medical School, St. Louis) **The role of reinforcement in controlling sequential IRT dependencies.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 145-151.—Investigated sequential dependencies with 2 male albino rats in a mixed and a tandem DRL responding schedule. In each schedule, 5- and 15-sec components were presented in fixed alternation. In the mixed schedule, a 5-sec interresponse time (IRT) followed a 15-sec IRT and a 15-sec IRT followed a 5-sec IRT in predictable sequence. The correlation between prior and subsequent IRTs, however, existed only when the prior IRT resulted in reinforcement. In the tandem schedule, an IRT greater than 5 sec. in the DRL 5-sec component was not associated directly with reinforcement. 1 S demonstrated sequential response patterns similar to those noted in the mixed schedule, even though the prior 5-sec IRT was not reinforced in the tandem schedule. Results indicate that the prior IRT length alone is not sufficient to influence the subsequent IRT length. Implications are, however, that a temporal response pattern arises when an interresponse interacts with schedule contingencies to control the interreinforcement interval.—*Journal abstract*.

2078. Beale, I. L. & Winton, A. S. (U. Auckland, New Zealand) **Inhibitory stimulus control in concurrent schedules.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 133-137.—Exposed 6

experimentally naive homing pigeons to a main key and a changeover key. Pecking the main key was reinforced on a variable-interval 5-min schedule when the key was blue and never reinforced when the key displayed a vertical line on a blue background. Each peck on the changeover key changed the stimulus displayed on the main key. Eash S was given 2 generalization tests, consisting of presentations on the main key of 6 orientations of the line on the blue background, with no reinforcements being given. In 1 test change-over-key pecks changed the stimulus; in the other test the changeover key was covered and the E controlled stimulus changes. Both responses to the 6 stimuli and time spent in the presence of the stimuli gave U-shaped gradients when the changeover key was operative. With most Ss, absolute rates of responding to each stimulus produced unsystematic gradients, whether or not the changeover key was operative.—*Journal abstract.*

2079. Campbell, Patrick E. & Wells, James F. (Southern Methodist U.) **Sequential effects of magnitude of delayed reward and magnitude of immediate reward on pattern running and resistance to extinction.** *Psychological Record*, 1970(Spr), Vol. 20(2), 203-210.—Trained 44 rats in a runway under a single alternation, partially delayed, reward schedule. The duration of delay was 20 sec. on all odd numbered trials in a 6 trial/day schedule. Reward duration was varied factorially with either 5 or 20 sec. access to wet mash on delayed (D) trials and 20 or 40 sec. on immediate (I) trials. All 4 groups learned to pattern respond, but patterning was most pronounced when D reward was 5 sec. and I reward was 40 sec. Small I reward increased resistance to extinction in the run section but not in the goal section. The goal measure yielded several interactions of the reward durations with blocks of extinction trials. Results are discussed in terms of E. J. Capaldi's modified aftereffects hypothesis.—*Journal abstract.*

2080. Cone, A. L. & Cone, Donna M. (Lynchburg Coll.) **Operant conditioning of Virginia opossum.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 83-86.—Found 2 male and 2 female laboratory-raised Virginia opossum to readily acquire a lever-press response for water reinforcement. Fixed ratio behavior is comparable to that observed in other species. Fixed interval (FI) behavior, however, tends to move fairly rapidly toward an economical response style in which very few responses/reinforcement are emitted. Neither introduction of limited hold procedures nor lengthening of the deprivation schedule had any effect upon the FI responding.

2081. Gilbert, R. M. (Alcoholism & Drug Addiction Research Foundation, Toronto, Ontario, Canada) **Response unity and reinforcement distribution.** *Psychological Record*, 1970(Win), Vol. 20(1), 1-7.—9 adult male hooded rats emitted 2-component chains which were subjected to random or fixed ratio schedules of reinforcement. Both components of the chains were sensitive to the reinforcement contingencies. Latency measures of each component decreased as reinforcement approached under fixed ratio schedules and remained relatively constant under random ratio schedules. Results are discussed in relation to the assumed unity of response chains, the differential sensitivity of chain components to experimental manipulations, and the characteristics of performance under fixed ratio schedules.—*Journal abstract.*

2082. Killeen, Peter. (Arizona State U.) **Preference**

for fixed-interval schedules of reinforcement. *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 127-131.—Trained 4 male white Carneaux pigeons on a 2-link concurrent chain schedule in which responding on either of 2 keys in the initial link occasionally produced a terminal link, signaled by a change in the color of that key and a darkening of the other. Further responding on the lighted key was reinforced with food according to a fixed-interval schedule. For 1 key, this fixed interval was always 20 sec., while for the other it was held at values of 5, 14, 30, or 60 sec. for several wk. In the initial link, all Ss responded relatively more often on the key with the shorter fixed interval than was predicted by the matching hypothesis. Responding in the initial link showed a large negative recency effect: Ss responded less frequently on the key that provided their last reinforcement than predicted from overall response rates. (18 ref.)—*Journal abstract.*

2083. Kramer, Thomas J. & Rilling, Mark. (St. Louis U.) **Differential reinforcement of low rates: A selective critique.** *Psychological Bulletin*, 1970(Oct), Vol. 74(4), 225-254.—Reviews the literature relevant to the DRL with respect to measurement of the behavior, bursts of responding, sequential dependencies, extinction and reconditioning, comparative aspects, punishment, reinforcement of 2 interresponse times, amount of deprivation and reinforcement, behavioral contrast, stimulus generalization, and response generalization. Results suggest that: (a) bursts of responding could be due to a lack of stimulus feedback, (b) similar interresponse times tend to follow each other, (c) the development of mediating behavior is correlated with responding which is more appropriate to the schedule contingencies, and (d) Ss "preferred" short interresponse times. The shape of the stimulus generalization gradients after training on a DRL schedule is either peaked, flat, or inverted depending on the schedule value and prior training. Studies loosely concerned with response generalization suggest that responding under this schedule may be qualitatively different from responding under a variable-interval schedule. Experimental approaches for investigating the possible inhibitory and/or aversive properties of differential reinforcement are indicated. (3 p. ref.)—*Journal abstract.*

2084. Powell, Robert W. (U. South Florida) **Probability of reinforcement and fixed-ratio responding: A model.** *Psychological Record*, 1970(Win), Vol. 20(1), 73-80.—For 2 white Carneaux pigeons the fixed-ratio (FR) requirement was increased and decreased several times. 2 other pigeons were studied for a large number of sessions at selected FRs. Consistent direct relationships between postreinforcement pause duration and ratio size were found for all Ss. Response rates generally decreased as the ratio requirement increased. Significant negative correlations existed between pause duration and response rate for 3 Ss. A probability of reinforcement model of FR responding is proposed which hypothesizes 2 distinct response rates: (a) a 0 rate (pausing) which occurs when the probability of reinforcement is lowest; and (b) a terminal rate which is relatively invariant within S. It is suggested that the occurrence of within-ratio pauses is the basis for decreases in response rate which have been observed when the ratio requirement was increased, and that variables which increase post-reinforcement pausing will increase the amount of within-ratio pausing.—*Journal abstract.*

2085. Rosenblith, Joan Z. (Harvard Medical School,

Boston, Mass.) **Polydipsia induced in the rat by a second-order schedule.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 139-144.—Studied drinking in 3 male albino Charles River rats pressing a bar on a 2nd-order schedule in which every 3rd completion of a 1-min fixed interval was followed by food presentation. A brief flash of light signaled the completion of each fixed-interval component. Ss drank not only after the food presentations but also after presentations of the light flash alone. A high rate of steady drinking followed intervals terminated by a food presentation. Drinking that followed intervals terminated by a light flash alone was of comparable rate, but characteristically interrupted by bar pressing. When 250-mg food pellets were used instead of 45-mg pellets, both drinking and bar-pressing rates increased substantially.—*Journal abstract*.

Punishment & Extinction

2086. **Dardano, J. F.** (Johns Hopkins U., Medical School, Div. of Behavioral Biology) **Fractional punishment of fixed-ratio performance.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 185-198.—Punished key-peck responses of 17 adult white Carneaux pigeons under a fixed-ratio (FR) 60 (Exp. I) or FR 99 (Exp. II) schedule of positive reinforcement by response-dependent electric shock during a segment of the ratio. The punishing stimulus was scheduled in 1 of 3 locations: the 1st 3rd of the ratio, the middle 3rd, or the final 3rd. At high shock levels, the different loci of punishment differentially affected the typical FR performance pattern. Postreinforcement pauses were lengthened by all punishment conditions but to a greater degree when the responses in initial 3rd of the ratio were punished. Disruption of responses before the punished segment of the ratio was a conspicuous feature of the performances when the middle or final 3rd of the ratio was punished. 2 of the punishment conditions produced similar effects on both FR base lines but punishing the final 3rd of the ratio suppressed the punished responses of the ratio only with the FR 99 schedule. General effects of all punishment conditions included consistent intrasession recoveries of partially suppressed performances, the rapid recovery of the FR performances after the punishment dependency was removed after complete suppression, and the facilitation of overall and/or local response rates of most Ss by low-intensity shock.—*Journal abstract*.

2087. **Gudenko, L. P.** (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Ugashenie uslovykh refleksov pri pereklyuchenii.** [Extinction of conditioned reflexes in switching over.] *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1969, Vol. 19(1), 162-165.—Dogs were subjected to extinction of a CR to a signal stimulus (bell) in an alimentary situation and subsequent application of the extinguished stimulus in an electrodeceptive situation. The findings confirm the view that "inhibition initially is localized not at the [cerebral] point of the signal stimulus, but in elements of the conditioned connection." Inhibition developed in the system of alimentary connections and did not transfer to the system of defensive connections. These 2 systems remained independent of each other and under certain conditions manifested antagonism to each other, so that complete inhibition of the alimentary reaction brought about the reciprocal manifestation of the defensive reaction.—*I. D. London*.

2088. **Henton, Wendon W. & Jordan, John J.** (Universitets Neurofysiologiske Inst., Copenhagen, Denmark) **Differential conditioned suppression during pre-shock stimuli as a function of shock intensity.** *Psychological Record*, 1970(Win), Vol. 20(1), 9-16.—5 different 20-sec visual stimuli were consistently terminated by an unavoidable 100-msec shock of .0, .1, .3, 1, and 3 ma. during sessions in which lever pressing by 3 adolescent male rhesus monkeys was reinforced on a random ratio 1% schedule. The magnitude of response suppression during Trial N was initially dependent upon the shock intensity terminating Trial N-1, and, subsequently, dependent only upon the shock intensity terminating Trial N. The terminal pattern of stimulus controlled differential suppression was stable and a monotonic function of shock intensity.—*Journal abstract*.

2089. **Orme-Johnson, David W.** (U. Maryland) **The effects of the response-shock contingency on conditioned punishment.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5719-5720.

2090. **Powell, Robert W.** (U. South Florida) **The effect of punishment shock intensity upon responding under multiple schedules.** *Journal of the Experimental Analysis of Behavior*, 1970(Sep), Vol. 14(2), 201-211.—Maintained responses of 2 white Carneaux pigeons in Exp. I, by multiple variable-interval, variable-ratio (VR) schedules of food reinforcement. Concurrent punishment was introduced, which consisted of a brief electric shock after each 10th response. The initial punishment intensities had no lasting effect upon responding. Then, as shock intensity increased, VR response rates were suppressed more quickly than variable-interval response rates. When shock intensity decreased, variable-interval responding recovered more quickly, but the rates under both schedules eventually returned to their prepunishment levels. In Exp. II, the following conditions were studied in 3 additional Ss: (a) with each shock intensity in effect for a number of sessions, punishment shock intensity was gradually increased and decreased and responding was maintained by multiple VR fixed-ratio (FR) schedules of food reinforcement; (b) changes in punishment shock intensity as previously described with responding maintained by either a VR or FR schedule, which were presented on alternate days; and (c) session-to-session changes in shock intensity with responding maintained by multiple VR, FR schedules. Responding under the 2 schedules was suppressed to approximately the same extent by a particular shock intensity. Postreinforcement pauses under the FR schedule increased as response suppression increased. (17 ref.)—*Journal abstract*.

SOCIAL & SEXUAL BEHAVIOR

2091. **Apfelbach, R. & Leong, Daisy.** (Max Planck Inst. für Verhaltensphysiologie, Seewiesen, W. Germany) **Zum Kampfverhalten in der Gattung Tilapia (Pisces, Cichlidae).** [Fighting behavior in the genus Tilapia (Pisces, Cichlidae).] *Zeitschrift für Tierpsychologie*, 1970(Feb), Vol. 27(1), 98-107.—Substrate- and mouth-brooders display tail beat, ramming thrust, and mouth fight. The specific patterns of 3 species were investigated. There was a clear relationship between territorial and fighting behavior.—*K. E. Grossmann*.

2092. **Grant, E. C., Mackintosh, J. H., & Lerwill, C. J.**

(Medical School, Birmingham, England) **The effect of a visual stimulus on the agonistic behavior of the golden hamster.** *Zeitschrift für Tierpsychologie*, 1970(Feb), Vol. 27(1), 73-77.—The display of the black mark on the chest indicates aggression in the golden hamster. Normal males showed an increase in flight behavior when paired with males in which the black mark had been intensified by dyeing.—*Journal abstract*.

2093. Hinde, R. A. & Atkinson, Sue. (Sub-Dept. of Animal Behaviour, Madingley, England) **Assessing the roles of social partners in maintaining mutual proximity, as exemplified by mother-infant relations in rhesus monkeys.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 169-176.—Examined the properties of various functions which have been used for assessing roles of mother and infant in maintaining mutual proximity, and in particular their dependence on absolute activity levels.—*Journal summary*.

2094. Koenig, Lilli. **Zur Fortpflanzung und Jugendentwicklung des Wüstenfuchses (Fennecus zerda Zimm. 1780).** [Reproduction and juvenile development of the fennec (Fennecus zerda Zimm. 1780).] *Zeitschrift für Tierpsychologie*, 1970(Mar), Vol. 27(2), 205-246.—K. E. Grossmann.

2095. Lamprecht, Jürg. (Max Planck Inst. für Verhaltensphysiologie, Seewiesen, W. Germany) **Duettsang beim Siamang, Symphalangus syndactylus (Hominidae, Hylobatidae).** [Duetting in the siamang, Symphalangus syndactylus (Hominidae, Hylobatidae).] *Zeitschrift für Tierpsychologie*, 1970(Mar), Vol. 27(2), 186-204.—The species is living monogamously. They utter far-carrying calls in pairs or families in the morning and in the evening. The concerts last up to 20 min. Pairs sing 20-50 sec. duets. The female emits 2 accelerated series of barking calls and the male interlaces with typical sounds at specific points. At 4 points the partners take notice of one another. Differences between individuals and pairs are represented in 5 distinguished individual calls and in the duet structure. Duets are probably related to partner bonds. There may also be relationships between certain duet components and territorial defense. Between families, calling may serve to inform (a) about the locality of the calling group, (b) of the group composition, and (c) of the identity of individuals or pairs. (31 ref.)—K. E. Grossmann.

2096. Levengood, W. C. (U. Michigan) **The sexual responses of male moths (Lepidoptera: Noctuidae).** *Michigan Academician*, 1969(Win), Vol. 1(1-2), 31-41.—Examined the role of infrared radiation in the sensing mechanisms of 2 species of nocturnal moths, *Spodoptera frugiperda* and *Heliothis zea*. Unmated male moths were housed in the center section of a 10.5 ft. test cage containing 7 compartments. Various stimuli were placed at 1 end of the test cage while control stimuli were placed at the opposite end. As measured by visitation rate, test Ss were found not to be significantly more attracted by virgin females than by confined males, nor were they attracted by a noncoherent polychromatic infrared source or a monochromatic pulsed infrared laser. However, attraction was observed when females were placed in an atmosphere of moist, moving air, and this attraction was suppressed by a white light placed in the center section. Test moths were found to be significantly more attracted to a combination of females, a black light, and a moist air flow than to either females alone or in combination with the black light. It is concluded that "attraction is a multiple variable phenomenon."—R. Wiltz.

2097. Mackintosh, J. H. (Medical School, Birmingham, England) **Territory formation by laboratory mice.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 177-183.—Groups of CFW/LAC mice were placed on each side of a central barrier in a 180 cm. sq. enclosure. When this barrier was subsequently lifted a male from each side defended a part of the enclosure. The boundaries of these territories were precise and were stable for up to 2 mo. Nonterritorial adult males were extremely restricted in their movements. Females and juveniles were not limited by the territory boundaries. Territory formation was related to the establishment of a social order: dominant mice became territory holders.—*Journal summary*.

2098. Peeke, Harman V. (U. California, San Francisco) **Habituation of conspecific aggression in the three-spined stickleback (*Gasterosteus aculeatus* L.).** *Behaviour*, 1969, Vol. 35(1-2), 137-156.—3 groups of fish (A, B, and C) were presented with a live male, a model of a male, and no special stimulation, for 15 min. each day for 10 days. Also, a live gravid female was presented to all 3 groups each day. Groups A and B both showed a decrement in response to their male stimuli, with the greater decrement in the case of Group A. Group A only showed an increase in sexual responses directed toward the female.—N. M. Ginsburg.

2099. Sadleir, R. M. (Simon Fraser U., Burnaby, British Columbia, Canada) **The establishment of a dominance rank order in male *Peromyscus maniculatus* and its stability with time.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 55-59.—Demonstrated that a sample of 8 wild male deer mice, when repeatedly matched in an arena situation against each other, showed a virtually constant single line ranking of aggressiveness which remained stable for 1 mo.—*Journal summary*.

2100. Signoret, J. P. (Lab. de Physiologie de la Reproduction, INRA, Nouzilly, France) **Sexual behaviour patterns in female domestic pigs (*Sus scrofa* L.) reared in isolation from males.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 165-168.—8 isolated gilts were ovariectomized and given estrogen therapy and then tested for attraction to males and the motor sexual response. No differences were observed in any tests between the isolated and normally reared gilts suggesting an innate basis for the patterns of female sexual behavior in pigs.—G. Greenberg.

2101. Terry, Roger L. (Hanover Coll.) **Primate grooming as a tension reduction mechanism.** *Journal of Psychology*(Sep), Vol. 76(1), 129-136.—Correlative events of primate grooming, e.g., injury, sexual activity, birth, and dominance position, indicate that grooming is a response to tension generated by a threat to the social integration of the emitter and/or target. Cross-species comparisons of general level of grooming, degree of group solidarity, presence of a dominance hierarchy, and general level of aggression suggest further that grooming results in a reduction in tension and a restoration of integration and that several acts of grooming involving many group members increase total group solidarity. (21 ref.)—*Journal summary*.

2102. Tschanz, B., Meyer-Holzappel, M., & Bachmann, S. (U. Bern, Switzerland) **Das Informationssystem bei Braunbären.** [The information system of the brown bear.] *Zeitschrift für Tierpsychologie*, 1970(Feb), Vol. 27(1), 47-72.—4 adult pairs were observed in a zoo. Places of body-rubbing were recorded: bears rubbed with the shoulder area, neck, and back of the head in an upright position, or with the

breast and throat. A sitting position and lying position occurred only in 1%; on all fours in 25%. Males and females have common as well as different rubbing patterns. There are seasonal variations in frequency. There are special male places at special areas, whereas females habitually rub only against specific parts of the tree (female places). Mixed spots were used by both sexes. Young bears hesitated when approaching a marked tree. Males can tell the sex from sniffing the rubbing places. Males pay more attention to female feces and urine than to excretions of other males. (15 ref.)—K. E. Grossmann.

2103. Walter, Roger O. & Hamilton, James B. (State U. New York, Downstate Medical Center, Brooklyn) **Head-up movements as an indicator of sexual unreceptivity in female medaka, *Oryzias latipes*** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 125-127. —Elevation of the forepart of the body, referred to as head-up movements, was more frequent in females during tests without spawning than in tests with spawning. The number of these movements/min increased immediately after spawning when females became unreceptive. The number of movements/min provided a quantitative index of the degree of unreceptivity of females.—*Journal summary*.

2104. Wilson, Wendell L. & Wilson, Carolyn C. (U. Washington) **Colony management and proposed alterations in light of existing conditions at the chimpanzee Consortium.** *USAF ARL Technical Report*, 1969(Mar), No. 69-8, 23 p.—Describes the behavioral and environmental conditions at the Consortium, a facility at the 6571st Aeromedical Research Laboratory, Holloman Air Force Base, New Mexico, with respect to the maintenance of healthy, reproducing animals at the lowest possible cost. Reproduction rates and frequency of aggression are compared with those reported for chimpanzees in their natural habitat. Reproduction is slightly lower and aggression more common in the Consortium. The role of laboratory colonies in insuring a future supply of chimpanzees for research without decimating wild populations is discussed. Suggestions for structural and procedural improvements predicted to increase reproduction, reduce aggression, increase the housing capacity, and reduce maintenance costs are made. It is stressed that the manipulative abilities and strength of chimpanzees should be taken into account whenever physical structures are planned. A method of introducing new animals is proposed. It is concluded that the Consortium has a tremendous potential with respect to both housing and social behavior research. Proposed modifications are included. (19 ref.)—*Journal abstract*.

2106. Bosiĭ, M. K. & Davidenko, I. M. (Pedagogical Inst., Cherkask, USSR) **Izmenenie tonal'noi chuvstvitel'nosti slukhovogo analizatora pod vliyaniem uprochnennogo differentsirovannogo tormozheniya.** [Alteration of tonal sensitivity of the auditory analyzer under the influence of stable differential inhibition.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969,

Vol. 19(1), 243-249.—Utilized motor-electrodefensive conditioning to study the influence of differential inhibition on the threshold tonal sensitivity of the auditory analyzer in 5 dogs. Differential inhibition, elaborated in response to tones of low (300 cps) and middle (5000 cps) frequencies, raised threshold tonal sensitivity for a long period of time (up to 24 hr. and more) after exclusion of inhibitory stimuli, while differential inhibition in response to high tones (16,000 cps), on the contrary, lowered it. Differential inhibition resulting from 3 differentiations, elaborated in response to tones of low (500 cps), middle (5000 cps), and high (15,000 cps) frequencies, produced greater changes in tonal sensitivity than that resulting from 1 differentiation. Tonal sensitivity was enhanced to a lesser degree in gross differentiations than in moderate differentiations. In fine and very fine differentiations, the excitability of the auditory analyzer declined sharply.—I. D. London.

2107. Saslow, Carol A. (U. Washington) **Control of reaction time in monkeys by pay-off bands: Relation to electromyographic and evoked potentials recordings.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5723-5724.

DEVELOPMENTAL PSYCHOLOGY

2108. Eichenwald, Heinz F. & Fry, Peggy C. (U. Texas, Southwestern Medical School, Dallas) **Nutrition and learning.** *Science*, 1969(Feb), Vol. 163(3868), 644-648.—Reviews studies suggesting that inadequate nutrition in infancy may result in permanent stunting of mental, physical, and neural growth. It is not clear in humans whether these impairments are caused by malnutrition alone or whether they are complexly combined with other factors, i.e., infection and a poor social and emotional environment. It is suggested that careful field studies are needed to clarify these questions. Political and social considerations are discussed.—P. McMillan.

2109. Feldmann, Erich. **Die Bedeutung der Kommunikationswissenschaft für die experimentelle Pädagogik** [The meaning of the science of communication for experimental pedagogy.] *Scientia Paedagogica Experimentalis*, 1968, Vol. 5(1), 42-67.—Discusses informatory, regulatory, and stimulatory effects of communication on child and adolescent development. The importance of analyzing mass media, especially TV and movies, as a means to a better understanding of changes in communication patterns is stressed. While some forms of communication can be investigated using sociological methods, it is suggested that further research possibilities can be offered through the use of cybernetic techniques. (French summary)—B. A. Stanton.

2110. Heise, David R. & Roberts, Essie P. (U. Wisconsin) **The development of role knowledge.** *Genetic Psychology Monographs*, 1970(Aug), Vol. (1), 83-115.—A test was administered to 93 children and 60 adults to measure knowledge of familiar roles. Analyses suggested that sex and class are not crucial determinants of overall role learning, but that distortions in role conceptions corresponding to sex or class do occur and are acquired at an early age. Analyses also suggested that early childhood is an important period for learning all

but the sibling roles, late childhood is important for learning sibling and other youth roles, and adolescence is important for learning male family roles and occupational roles. In another analysis it was found that roles are not learned along "paths of role similarity" as a generalization-discrimination hypothesis would suggest, but that perhaps roles are learned by developing special sets or orientations with respect to mother, father, peers, and "jobs and work." Intelligence (IQ) was found to have a negligible relation with overall role learning but showed some relation with knowledge of roles learned by focusing on the mother. Of the variables considered, the one (besides age) which had most power in explaining variations in role knowledge was family size: a greater number of siblings, and especially brothers, seems to interfere with gaining mature role knowledge. (22 ref.)—*Author abstract.*

2111. Hess, Anne L. & Bradshaw, H. L. (Ohio U.) **Positiveness of self-concept and ideal self as a function of age.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 57-67.—Through comparisons of 4 age groups on self-concept and ideal self, using the Gough Adjective Check List it was found that self and ideal were significantly different for 175 Ss at all age levels (high school-age 65), and that the oldest group had the most positive self-concept and ideal self. It was also found that life satisfaction and achieving life's goals were significantly related to the positiveness of the self-concept. Results are discussed in terms of C. R. Roger's theory and research, and L. Festinger's cognitive dissonance theory, with neither receiving strong support. (25 ref.)—*Journal summary.*

2112. Hooper, Peggy P. & Powell, Evan R. (U. Georgia) **Influences of musical variables on pictorial connotations.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 125-128.—Conducted 3 experiments to compare amounts of figural elaboration and scores on originality stimulated through music in child and adult Ss by: absolute vs. program music; participation vs. motivated vs. passive listening; and live vs. recorded performance. Taken separately, absolute music, participation, and live performance were shown to stimulate higher scores on the Torrance-type picture-drawing criterion for all S ages. Thus musical variables have differential warm-up effects on elaboration and originality in picture-drawing tasks.—*Journal summary.*

2113. Lavrinenko, A. I. (Inst. of Psychology, Moscow, USSR) **K voprosu ob ustoychivosti moral'nykh suzhenii u shkol'nikov.** [The question of stability of moral judgments in school children.] *Voprosy Psikhologii*, 1970(May), Vol. 16(3), 94-104.—576 4th, 6th, and 9th graders predicted their own behavior in 11 hypothetical cases of moral conflict. Predictions were made anonymously or with the information given that either classmates or parents would know each S's answers. It was found that while a given moral judgment may be relatively stable within an age level, judgments change with age. They are influenced more by the opinion of adults at an earlier age and more by that of peers at a later age. Similarities and differences of these and Bronfenbrenner's results are discussed. (English summary)—*L. Zusne.*

2114. Matsuda, Fumiko. (Hiroshima U., Japan) [Developmental study of time, space and velocity estimations: III. Velocity estimation.] *Japanese Journal of Psychology*, 1970(Feb), Vol. 40(6), 297-303.—Examines velocity estimation in motion perception by the method

of reproduction. Ss were 16 1st and 16 4th graders and 16 undergraduates. Results reveal that (a) in all groups constant standard velocities, 1.8, 3.2, 5.8, and 10.5 cm/sec., are significantly overestimated as exposure time and spatial distance become smaller. This tendency was stronger in females than in males. (b) 4 lines by ratios of reproduced velocities to standard velocities, for the 4 standard velocities, yielded nearly 1 curved line, when exposure times of standard stimuli are placed in the abscissa. (18 ref.)—*English summary.*

2115. McCammon, Robert W. (Ed.) (U. Colorado, Medical School, Denver) **Human growth and development.** Springfield, Ill.: Charles C Thomas, 1970. xi, 295 p. \$9.

2116. Resnick, Lauren B. (U. Pittsburgh, Learning Research & Development Center) **Relations between perceptual and syntactic control in oral reading.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 382-385.—Conducted a study of the relations between perceptual and syntactic factors in reading using the eye-voice span technique. Each S read aloud 54 passages projected on a screen. At a fixed point in the text the screen was blacked out, but S continued to read as far as he could. Measures of average number of words read after light-out (eye-voice span) and number of times S stopped at a phrase boundary (stops) were used. There were 4 groups of Ss: 3rd and 5th graders, undergraduates under standard conditions, and undergraduates under a perceptual strain condition created by projecting the slide upside down. Both eye-voice span and stops increased from 3rd grade-college under standard conditions, but college Ss under perceptual strain performed like 3rd graders. For college strain Ss there was a high correlation between eye-voice span and stops; for the other groups there was no significant correlation. Results are consonant with the theory that perceptual control is necessary for syntactic control to develop, but that the latter is learned independently and does not develop automatically as perceptual skill increases.—*Journal abstract.*

2117. Zigler, Edward. (Yale U.) **Social class and the socialization process.** *Review of Educational Research*, 1970(Feb), Vol. 40(1), 87-110.—The research in the area has been confined to specific child training practices in intrasocietal variations relating to social-ecological-economic, genetic, and developmental aspects. None of these seem to be capable of solely explaining all of the behavioral correlates of social class membership. With the rather limited research to date, the most promising seems to be in terms of a developmental approach. (5 p. ref.)—*P. D. Leedy.*

INFANCY

2118. Friedman, Steven; Nagy, Alice N., & Carpenter, Genevieve C. (Boston U.) **Newborn attention: Differential response decrement to visual stimuli.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 44-51.—Exposed 40 newborn human Ss to 1 of 2 visual stimuli: a 2 × 2 or a 12 × 12 black and white checkerboard target, in an experiment employing a 2 × 2 × 8 factorial design (Sex × Target × Trials) with repeated measures on 1 factor (Trials). Using visual fixation as the dependent variable, results indicate an overall response decrement effect with repeated presentation of the visual stimuli ($p < .005$) and an interaction between number of elements (or redundancy) in the visual stimulus, sex of

the infant, and trials ($p < .005$). The triple interaction was based on a tendency for the males to show more decrement to the less-redundant (2×2) target, and for females to show more decrement to the more-redundant (12×12) target. (23 ref.)—*Journal abstract*.

2119. Greenberg, David; Uzgirlis, Ina C., & Hunt, J. M. (U. Nebraska) **Attentional preference and experience: III. Visual familiarity and looking time.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 123-135.—With 4 wk. of perceptual exposure to a pattern beginning at age 4 wk., 24 infants showed attentional preference for their familiar pattern by looking more at it in tests where it was presented simultaneously with an unfamiliar one. After 2 additional wk. of exposure to their familiar pattern, such tests showed a shift of preference toward the unfamiliar pattern which increased with a 2nd additional 2 wk. of exposure. Skipping the 1st test had no influence on the degree of preference following 6 wk. of exposure with the 1st test included. Once an infant came to prefer the unfamiliar pattern, this preference persisted regularly in subsequent tests. (18 ref.)—*Journal summary*.

2120. Hunt, J. M. (U. Illinois) **Attentional preference and experience: I. Introduction** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 99-107.—Studies of imprinting in animals, Piaget's observations of the development of intention and imitation in his children, and the commonly observed tendency of infants to leave their preoccupations for TV with the sound of familiar commercials have suggested that repeated perceptual encounters with objects or patterns lead to attentional preference for what is familiar before they lead to attentional preference for what is unfamiliar or novel. A series of studies were made to test this hypothesis which is consistent with D. O. Hebb's theory of pleasure. Findings of preference for the unfamiliar in very young infants with repeated exposures during a single session are explained in terms of perceptual satiation, based on short-term memory, and are differentiated from habituation which is presumed to be dependent upon long-term memory. (37 ref.)—*Journal summary*.

2121. Hutt, C., et al. (University Hosp., Groningen, Netherlands) **Habituation in relation to state in the human neonate.** *Nature*, 1968(Nov.), Vol. 220(5167), 618-620.—Investigated a hypothesized differential rate of habituation in relation to selective responsiveness to potentially meaningful auditory stimuli. EMGs were recorded from right and left biceps brachii, triceps, and quadriceps using surface electrodes on 10 full-term 4-8 day old neonates. Stimuli consisted of a 125-Hz square-wave tone, a female voice saying "baby," and a 125-Hz sine-wave tone. Each stimulus was presented on 60 trials, 30 min. after each S was fed. There was a 30-sec pause between instigation of a new stimulus trial series. Results fail to demonstrate any degree of habituation to auditory stimulation. In addition, decrement of response did not appear to be related to any change in state. (23 ref.)—*P. Shibelski*.

2122. Korner, Anneliese F. & Thoman, Evelyn B. (Stanford U., Medical School) **Visual alertness in neonates as evoked by maternal care.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 67-78.—Explored, within the context of common maternal ministrations, the relative efficacy of contact and of vestibular stimulation, with and without the upright position, in producing visual alertness in neonates. Ss

were 40 crying and 24 sleeping 2- to 3-day-old healthy full-term newborns, equally divided into males and females, breast and bottle-fed infants. Each S was given, in random order, 6 interventions which entailed singly, or in combination, contact and vestibular stimulation with or without the upright position. A 6-point scale assessing levels of alertness with high interobserver reliability was devised. There were highly significant individual differences in alerting response between the Ss, but no differences due to sex or mode of feeding. In the context of soothing the S, vestibular stimulation had a highly significant effect on alerting. Contact had little effect on evoking alertness except when combined with vestibular stimulation and the upright. Ss responded minimally when stimulated in the context of rousing. Findings imply that, at least during the neonatal period, the vestibular stimulation which attends most caretaking activities may be more crucial than contact for certain aspects of early human development. (20 ref.)—*Journal abstract*.

2123. Lewis, Michael & Wilson, Lloyd. (Educational Testing Service, Princeton, N.J.) **An infant stabilimeter.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 52-56.—Describes an inexpensive, accurate stabilimeter and briefly discusses various measurement problems.—*Journal abstract*.

2124. Sameroff, Arnold J. (U. Rochester) **Changes in the nonnutritive sucking response to stimulation during infancy.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 112-119.—Studied non-nutritive sucking response change to auditory stimulation in 22 1-, 2-, and 3-mo-old infants. Each S was stimulated with 5 stimuli, presented 4 times during 3 sessions at 24-hr intervals. The 1- and 2-mo-old Ss were tested again 1 mo. later for another 3 sessions. The response of younger Ss was ambiguous. The response of older Ss showed reliable shortening of sucking burst and lengthening of sucking interval. Neither differential effects of the stimuli nor habituation of response were found.—*Journal abstract*.

2125. Tennea, K. H. & Lampl, E. E. **Defensive reactions to infantile separation anxiety.** *Journal of the American Psychoanalytic Association*, 1969(Oct), Vol. 17(4), 1142-1162.—Anxiety reactions to experimentally induced minor separations from mother were observed in a group of normal 7 mo.-3 yr. old infants. Behaviors resulted that reduced manifest anxiety. Such behaviors are possible responses to anxiety in the transitional period between early sensorimotor behaviors and later defense mechanisms. (28 ref.)—*D. Prager*.

2126. Uzgirlis, Ina C. & Hunt, J. M. (Clark U.) **Attentional preference and experience: II. An exploratory longitudinal study of the effect of visual familiarity and responsiveness.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 109-121.—15 infants exposed to both a stable and a mobile pattern over their cribs, beginning at ages of 4-5 wk., looked longer at their familiar patterns than at an unfamiliar pattern in tests of attentional preference presenting simultaneously both an unfamiliar and a familiar pattern conducted at ages of 8-9 wk. After a 2nd 4 wk. of exposure to their familiar patterns, however, Ss looked more at the unfamiliar pattern in such tests at 12-13 wk. of age. This shift of attentional preference from the familiar patterns to the unfamiliar with additional perceptual exposure (and age) supports the hypothesis of a process in which perceptual encounters lead 1st to attentional preference for what is

familiar before leading to interest in the unfamiliar or novel.—*Journal summary.*

CHILDHOOD

2127. ———. **Cognitive development in children: Five monographs of the society for research in child development.** Chicago, Ill.: U. Chicago Press, 1970. xii, 698 p.—Presents monographs derived from reports and papers of several authors presented at 5 conferences of the Society for Research in Child Development dealing with: (a) thought in the young child, (b) basic cognitive processes in children, (c) acquisition of language, (d) mathematical learning, and (e) European research in cognitive development.

2128. Alvik, Trond. (Royal Danish School of Educational Studies, Copenhagen) **The problem of anxiety in connection with investigations concerning children's conception of war and peace.** *Scandinavian Journal of Educational Research*, 1968, No. 3-4, 215-233.—Discusses views on whether or not questioning children about war and peace provokes anxiety. The literature is surveyed and an exploratory study employing a 4-group pretest/posttest design to register variations in level of anxiety is presented. Results from 24 2nd, 4th, and 6th grade children show that no anxiety is provoked.

2129. Brůšek, Ján. **Aparatúra na sledovanie pozornosti a vytrvalosti.** [An apparatus for observing attention and perseverance.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(1), 61-70.—Describes an apparatus constructed to study the course of attention and perseverance in children. S's task is to press 1 of 48 keys on a response panel according to the position of 2 luminous stimuli. Either a spontaneous rhythm of response to the stimulus can be used, or a directed rhythm that can be increased after a stress situation. The apparatus is fully automated, has 3 step-by-step selectors for switching light stimuli and differentiating the correct response, and registers the total number of correct responses and stimuli involved. Time is measured by a stop watch. (Russian summary)—*English summary.*

2130. Cravioto, J., et al. **The ecology of growth and development in a Mexican pre-industrial community: I.** *Monographs of the Society for Research in Child Development*, 1969, Vol. 34(5), 76 p.—Ss were all children born during 1 yr. in a rural preindustrial community situated in the hot semihumid zone of Mexico. "This 1st report is concerned with the condition of the children at birth and with their physical and behavioral progress during the 1st mo. of postnatal life." This report introduces a series of reports deriving from the longitudinal study of the children in this birth cohort, and includes "the general design of the study and with the methods used for the collection of data on the community, the children, and the families from which they derive."—*A. Barclay.*

2131. Davidson, Nancy H. & Fitzgerald, Hiram E. (Michigan State U.) **Recency and summation effects of nonreward in children.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 16-27.—Investigated the effects of recency and summation of frustrative nonreward on children's performance. 30 kindergarten children performed a lever-pulling task on a 3-lever apparatus. Session I consisted of 100% reinforcement; Sessions II and III consisted of 3 partial reinforcement patterns presented in random order. Analysis of latency

at the 3rd lever confirmed the recency hypothesis, i.e., when a single nonreward was administered in 2 different patterns a greater frustration effect (FE) occurred after the more immediate nonreward than after a nonreward that was separated from the time of measurement by a rewarded response. The analyses for latency also support the notion of the summation properties of nonreward since 2 successive nonrewards yielded a greater FE than a single nonreward. Analysis of movement time shows no evidence of recency and suggestive support for summation effect. The concept of reward expectancy in studies of the FE in children is discussed.—*Journal abstract.*

2132. Fialkina, G. (Prosveshchenie Publishing House, Moscow, USSR) **Izdatel'stvo "Prosveshchenie"—doshkol'nym rabotnikam.** [Prosveshchenie Publishing House—for preschool professionals.] *Doshkol'noe Vospitanie*, 1970, Vol. 43(3), 123-124.—Notes professional publications for the end of 1969 and for 1970, including those planned.—*J. D. London.*

2133. Goyeche, John R. (U. Waterloo, Ontario, Canada) **Cardiac activity during anticipatory attention in the young child.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 179-185.—Ss were 50 boys in Grades 1 and 2. Each was studied in a mobile laboratory. 30 visual recognition trials were presented by means of a carousel slide projector. Relationship between performance and cardiac activity seems to be a function of age. It is suggested that in order to perform correctly, younger children have to be more attentive.—*R. D. Nance.*

2134. Holliman, Neil B. (Midwestern U.) **The scaling of incentives for children by pair comparison.** *Psychological Record*, 1970(Spring), Vol. 20(2), 197-202.—Investigated the use of children's preferences as a basis for identifying and scaling incentives. A modification of the pair comparison procedure increased the type and number of incentives which could be scaled. 72 school children of both sexes and a mean age of 7 and 11 yr. scaled 12 different incentives. 4 different scales were derived in accordance with age and sex differences. Results support the reliability of the procedure and the obtained scales. The presence of age and sex differences in incentive preferences of children was confirmed.—*Journal abstract.*

2135. Huff, Joan. (State University Coll. New York, Oswego) **Games that children play.** *New York State Education*, 1967(Feb), Vol. 54(4), 32-33.—Discusses the historical context and evolution of some of the better known children's games.—*L. D. Summers.*

2136. Kline, Hayes K. (Smith Coll., School for Social Work) **An exploration of racism in ego ideal formation.** *Smith College Studies in Social Work*, 1970(Jun), Vol. 40(3), 211-235.—15 Negro and 15 white children, ages 5-7, whose parents consented to their participation in a study, were interviewed concerning components believed to comprise the ego ideal. Ss were presented first with a doll of their own race and then with a doll of the opposite race and asked to judge whether each doll would achieve the child's standards or which would exceed in attainment. Findings showed both groups expressed positive views about prospects for dolls of both races, suggesting that idealizing operations of children may be uncontaminated by racial influences.—*M. W. Linn.*

2137. McWhinnie, Harold J. (Ohio State U.) **Some relationships between creativity and perception in**

sixth grade children. *Scientia Paedagogica Experimentalis*, 1968, Vol. 5(1), 84-90.—Reviewed studies by J. Getzels and P. Jackson (see PA, Vol. 36:5HD93G), H. A. Witkin (see PA, Vol. 37:819), and F. Barron (see PA, Vol. 38:6077). Results of a battery of perception and creativity tests given to 136 6th graders indicate that: (a) behaviors studied are more discrete and separate than previous research has assumed, and (b) there are significant sex differences on several creativity variables with males being stronger than females. (French summary)—G. Steele.

2138. Mischel, Walter & Ebbsen, Ebbe B. (Stanford U.) **Attention in delay of gratification.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 329-337.—Explored the role of attentional processes in voluntary delay of reward by manipulating children's attention to the rewards for which they were waiting in a delay-of-gratification paradigm. 32 preschool children waited for a preferred but delayed reward while facing either the delayed reward, a less preferred but immediately available reward, both rewards, or no rewards. The dependent measure was the amount of time they waited for the preferred outcome before forfeiting it for the sake of the less desired but immediately available one. Results contradict predictions from psychodynamic theory and from speculations concerning self-instructions during time binding. Unexpectedly, but in accord with frustrative nonreward theory, voluntary waiting time was substantially increased when Ss could not attend to rewards during the waiting period. Implications are discussed for a theory of the development of delay of gratification. (22 ref.)—*Journal abstract*.

2139. Nadel, J. & Pardo, A. M. **Degré d'extensibilité et réglage de l'activité musculaire en travail statique chez les garçons de 7 à 12 ans.** [Degree of extensibility and regulation of motor activity in static work among boys 7 to 12 years of age.] *Enfance*, 1970(Jan), No. 1, 55-66.—Fostered by Wallon's contention that motricity and personality are related, this preliminary study sought to establish the influence of the degree of extensibility of groups of muscles on regulation of muscular activity of the arms during static work. Results show that the obtained relationships vary with the groups of muscles considered and with age. The findings can be interpreted as an expression of the classic law of proximo-distal evolution.—S. S. Marzolf.

2140. Norton, Dolores G. (Bryn Mawr Coll.) **Environment and cognitive development: A comparative study of socio-economic status and race.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5526-5527.

2141. Pardo, Ana M. **Sur certains indices de l'extensibilité musculaire chez l'enfant normal entre 7 et 12 ans.** [Concerning certain indices of muscular extensibility among 7 to 12 year old children.] *Enfance*, 1970(Jan), No. 1, 67-90.—Analysis of genetic and sex differences shows that, for the 8 indices used, there is a genetic evolution within the age range studied; sex difference tends to become inverse at age 12, and is presumed a consequence of the onset of puberty; there is no global extensibility, as in infancy, and among boys 3 regional structures are established. Evidence for a relationship between extensibility and psychosocial conduct is presented.—S. S. Marzolf.

2142. Rhodes, L. E., Dustman, R. E., & Beck, E. C. (Veterans Administration Hosp., Phoenix, Ariz.) **The visual evoked response: A comparison of bright and**

dull children. *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 364-372.—Recorded visual evoked responses (VER) from central and occipital scalp of 20 bright children (Full Scale WISC scores, 120-140, $X = 130$) and 20 dull children (Full Scale WISC scores, 70-90, $X = 79$). Ss were 10-11 yr. old and each group was composed of 10 boys and 10 girls. Results were: (a) the late components of responses recorded from both occipital and central scalp were reliably larger for the bright Ss, and (b) dull Ss demonstrated essentially no hemispheric differences between the amplitudes of the right and left central responses. Bright Ss had right central responses which were consistently larger than responses from the late components of the left scalp. Differences between the bright and dull Ss was not simply a function of the maturational process. The bright Ss' VER amplitudes were similar to normal 13- and 14-yr-old children's; however, the dull Ss' VER amplitudes were smaller than those of either younger children or normal children their own age. (French summary) (38 ref.)—*Journal summary*.

2143. Steinman, Warren M. (U. Illinois) **Generalized imitation and the discrimination hypothesis.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 79-99.—Generalized imitation is characterized by the continued imitation of nonreinforced responses even after many sessions of differential reinforcement. It has been suggested that this generalized imitation effect is due to the child's inability to discriminate reinforced from nonreinforced occasions. Results of 3 experiments with 2 4-yr-old girls and 4 6-7 yr. old boys indicate that the "discrimination explanation" may be only partially correct. Although Ss imitated a nonreinforced response when no reinforced alternative was available, they reliably imitated the reinforced response when it was presented in a choice procedure. Similarly, Ss immediately stopped imitating nonreinforced responses when simply instructed to stop. It is suggested that the generalized imitation effect is largely a function of instructional and other social variables operating within typical generalized imitation procedures. (16 ref.)—*Journal abstract*.

Learning

2144. Beller, E. Kuno. (Temple U.) **The concept readiness and several applications.** *Reading Teacher*, 1970(May), Vol. 23(8), 727-737, 747, 765.—Reviews the concept of readiness as discussed in the writings of Rousseau, Gesel, Piaget, Watson, and Bruner, and proposes that statements concerning the concept can become more meaningful if: (a) "the criteria of readiness are pinned down to specific activities or operations in such a way that their relationship" to learning variables can be ascertained and predicted; and (b) the operations, etc., defining readiness relate to either new operations which must be learned or the methods by which the new operations are taught. Research in which such a formula has been applied to the study of cognitive, emotional, and motivational factors in children is discussed. Such research indicates an interrelationship between readiness and method of teaching such that individualized instruction produces positive effects. (19 ref.)—R. Wiltz.

2146. Breyer, Norman L. (Florida State U.) **Effects of selected teacher and pupil characteristics on social learning.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5672-5673.

2147. Ching-Yi Wu Yeh, Joyce. (684 Jefferson Dr., Cleveland, O.) **Transposition and transfer of absolute responding as functions of learning-set training and stimulus similarity.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 57-66.—Studied transposition and transfer of responding in the intermediate size problem in 108 4th and 5th grade children, with training and stimulus similarity as independent variables. Some Ss were pretrained to respond either to the relational stimulus (the middle-sized stimulus) or to the absolute (always the same) stimulus, while others served as nontrained controls. Pretraining was given under learning-set procedures. The type of pretraining interacted with stimulus similarity to determine ease of learning the transfer task. Transfer performance was significantly affected by the training conditions, with the differential effect being more pronounced under the distinctive-stimulus pretraining condition.—*Journal abstract*.

2148. Dickerson, Donald J. (U. Connecticut) **Effects of naming relevant and irrelevant stimuli on the discrimination learning of children.** *Child Development*, 1970(Sep), Vol. 41(3), 639-650.—Studied the simultaneous discrimination learning of 80 2nd graders under 4 transfer conditions. Prior to discrimination learning, training was given during which groups of 20 Ss learned distinctive names for (a) the relevant cues of the discrimination problem, (b) 2 different cues along the relevant dimension, (c) the variable-irrelevant cues of the problem, and (d) 2 different cues along the variable-irrelevant dimension. The 4 groups were ordered, from best to poorest in subsequent discrimination performance, a-b-d-c. This ranking is consistent with a chaining theory interpretation of results. Backward learning curves showed performance differences among the groups to be in the length of the initial chance portions of the curves, suggesting that the 4 training conditions had differential effects upon the probability of attending to the relevant dimension at the start of the discrimination problem.—*Journal abstract*.

2149. Gagné, Robert M. & Wiegand, Virginia K. (Florida State U., Coll. of Education) **Effects of a superordinate context on learning and retention of facts.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 406-409.—Gave 44 4th graders 5 facts to learn and remember about howling monkeys, each being presented in a context with 4 other facts. $\frac{1}{2}$ the Ss learned the facts in a context containing a superordinate statement (topic sentence), the other $\frac{1}{2}$ with a coordinate (related) statement. Retention was measured in $\frac{1}{2}$ of each group by presenting the topic sentence immediately before the retention test, and in $\frac{1}{2}$ without. Significantly greater remembering, measured by recall and recognition scores, was found in groups having the topic sentence presented just prior to the retention test. Results indicate the major effect of the superordinate context cue to occur in retrieval.—*Journal abstract*.

2150. Hemry, Frances M. (U. Texas) **Verbal and nonverbal reinforcement combinations as related to impulsive-reflective style of responding in primary grade children.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5675.

2151. King, William L. & Holt, Julia R. (City Coll.,

City U. New York) **Conjunctive and disjunctive rule learning as a function of age and forced verbalization.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 100-111.—Presented 24 6-, 24 9-, and 24 12-yr-old girls with either 2 conjunctive or 2 disjunctive rule-learning problems. Older Ss made fewer errors than younger ones. On the 1st problem, disjunctive rules were more difficult than conjunctive ones, and forced verbalization facilitated performance. On the 2nd problem, neither rules nor verbalization significantly affected performance. Data were interpreted as reflecting hypothesis-testing processes at all ages, although there was some evidence suggesting that 6 yr. olds differed from the older Ss.—*Journal abstract*.

2152. Klein, Judith F. (Rutgers State U.) **Effect of sex, grade level, and alternative conditions of reinforcement on performance in a discrimination task.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5713.

2153. Miller, Adam W. & Clark, Norma. (St. Cloud State Coll.) **Self-reinforcement established for a discrimination task.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 1-6.—Investigated the effects of different conditions on developing a conditioned verbal reinforcer and studied its use as a self-reinforcer. In a 2×4 factorial design 80 2nd grade Ss were pretrained on a discrimination task. After correct choices Ss said "pib" and received 1 of 3 reinforcers: candy, verbal reinforcement from E, combination, or no response (controls). On a 2nd discrimination task, $\frac{1}{2}$ of the Ss used "pib" for a self-reinforcement; $\frac{1}{2}$ did not. Results indicate that a combination of primary and conditioned reinforcers was most effective in developing a verbal conditioned reinforcer, which effectively functioned as a self-reinforcer to facilitate new learning.—*Journal summary*.

2154. Rivas-Vazquez, Ana A. (U. Miami) **Conflict behavior in normal and maladjusted children.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5696-5697.

2155. Schaeffer, Benson & Ellis, Stephen. (U. Oregon) **The effects of overlearning on children's non-reversal and reversal learning using unrelated stimuli.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 1-7.—Attempted to show that the response to explicit dimensions is not crucial to the difference in relative difficulty between nonreversal and reversal shifts in children. To eliminate the possibility of the response to explicit dimensions, the shift problems were defined using unrelated stimuli, and a successive discrimination procedure was employed. 164 7-, 8-, and 9-yr-old children served as Ss. In Exp. I no overlearning was given, and nonreversal shifts were easier than reversal shifts. In Exp. II overlearning was given, and reversal shifts were easier than nonreversal shifts. The studies demonstrate that the response to explicit dimensions was not crucial to the change from easier nonreversal to easier reversal shifts during overlearning. Interpretations are offered in terms of learning mechanisms which rely on an increase in shift discriminability during overlearning and/or the creation of stimulus clusters.—*Journal abstract*.

2156. Shiebler, Mary C. (Fordham U.) **The effect of age and mode of representation on organizing variables in verbal learning and retention.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5679.

2157. Vajanasontorn, Chalermwong. (Utah State U.) **Superordinate words and subordinate words in mediate association.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5680-5681.

2158. Zimmerman, Peggy. (City Coll., City U. New York) **Retention in threatening and non-threatening stories by kindergarten children.** *Graduate Research in Education & Related Disciplines*, 1968(Win), Vol. 4(1), 81-91.—Investigated whether 20 white middle class kindergarten children retained more facts about a story without threatening material than about a story containing threatening material. Results show that Ss remembered more content aspects of the nonthreatening story than of the threatening story regardless of the sequence in which they heard the stories. Consequences of results for the context in which many school subjects are taught are examined.—*Journal summary*.

Concepts & Language

2159. Bickley, Albert C. (U. Georgia) **An analysis of frequency, learning rate, and semantic congruence as categorization constraints on beginning readers.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5278.

2160. Bormuth, John R., Manning, John; Carr, Julian, & Pearson, David. (U. Chicago) **Children's comprehension of between- and within-sentence syntactic structures.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 349-357.—Conceptualized and operationally defined 3 classes of the skills by which knowledge is acquired from written language and made a preliminary determination of whether the skills defined represent homogeneous classes of behaviors and are hierarchically related. The test was administered to 240 4th graders. Question transformations which derive questions and their correct responses from the various types of syntactic-structures studies were used to operationally define each skill. It seemed from the analyses of the Ss' responses that the skills defined represented homogeneous response classes which may be hierarchically related. However, the Ss showed an unexpectedly low level of performance on these seemingly simple and basic skills.—*Journal abstract*.

2161. Carmona Gutiérrez, Arsinio & Solís, Mercedes. **Formación Intuitiva del concepto de la palabra.** [Intuitive formation of the concept of word.] *Psicología y Educación*, 1968(Jul), Vol. 5(11), 3-10.—In order to study the development of intuitive grammatical functioning, an oral test of 15 simple sentences was given to 40 4- and 5-yr-old preschoolers, 40 5- and 6-yr-old preschoolers, 50 6- and 7-yr-old 1st graders, and 40 7- and 8-yr-old 2nd graders. Criteria tested were conception of a sentence as (a) 1 word, (b) units of meaning, (c) units of sound, and (d) correct identification. It was found that the youngest Ss considered a sentence to be a single thought and equivalent to 1 word. Each progressive age level showed improved grammatical functioning, with the highest rate of correct answers from the oldest Ss. Based on these results, it is speculated how to best meet the educational needs of young children at different developmental levels of learning. (English & French summaries)—*P. Hertzberg*.

2162. Denner, Bruce. (Indiana U.) **Representational and syntactic competence of problem readers.** *Child Development*, 1970(Sep), Vol. 41(3), 881-887.—Admin-

istered a test (previously given to normal and brain-damaged 4-12 yr. olds) to 1st grade problem readers, 1st grade average readers, 3rd-5th grade problem readers, and Head Start preschoolers. Problem readers and Head Start Ss were as competent as average readers in associating nonrepresentational linear forms with words. But they were significantly less competent in synthesizing whole sentences from individual linear forms. Findings are interpreted in view of the distinction between oral and written language.—*Journal abstract*.

2163. Guthrie, John T. & Baldwin, Thelma L. (Johns Hopkins U., Center for Study of Social Organization of Schools) **Effects of discrimination, grammatical rules, and application of rules on the acquisition of grammatical concepts.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 358-364.—Shows the occurrence of the indefinite article to be a concept similar to those studied in the general concept-formation paradigm. The acquisition of this grammatical concept was examined using 80 inner-city, Negro 5th graders. Learning an auditory discrimination of instances and noninstances of the concept did not affect the acquisition of the ability to produce instances of the concept orally. Likewise, learning to verbalize the grammatical rule which governs the concept did not facilitate concept formation. However, training on the application of the verbalized rule strongly facilitated concept formation ($p < .001$). The application training was superior to rule learning for low- but not high-IQ Ss. Performance on a concept-transfer task was not facilitated by the acquisition of the concept. (17 ref.)—*Journal abstract*.

2164. Johnson, N. B., Middleton, Margaret R., & Tajfel, Henri. (U. Bristol, England) **The relationship between children's preferences for and knowledge about other nations.** *British Journal of Social & Clinical Psychology*, 1970(Sep), Vol. 9(3), 232-240.—A test of factual knowledge of about 10 nations was developed and applied to 96 7-11 yr. old middle- and working-class children, whose preferences for these nations had already been determined. The relationship between preference for and knowledge about other nations was found to be curvilinear in form and did not seem to be accountable for in terms of a similar relationship in environmentally available cues. Working-class Ss displayed considerably less knowledge than middle-class Ss. Causal implications of the findings are discussed. (20 ref.)—*Journal abstract*.

2165. Kuniya, Yoriko. (Kwansei Gakuin U., Nishinomiya-Shi, Japan) **Development of language in early childhood.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 166-174.—Reports the case of a girl born in late 1961. Her speech record was started at age 7 mo. If this child is typical, language development today is more "premature" than before. However, the difference is greater in words susceptible to external incentive than in those more related to inner development.—*R. D. Nance*.

2166. Nasi, Pierre & Nasi, Claude. **Etude des modes de pensée du stade préopératoire à travers le langage.** [A study of modes of thought at the pre-operative level with respect to language.] *Enfance*, 1970(Jan), No. 1, 31-45.—60 3½-4½ yr. old Ss were shown 5 series of pictures. Each series of 3 or 4 pictures told a story. Ss were asked to tell the stories and their recorded responses constituted the data. Among the major findings are: (a) frequent confusion of part and whole; (b) prevalence of Stern's phenomenon of transduction, i.e., a pseudological connection between ideas;

(c) complete lack of statements of comparison; (d) the meaning of number is limited to 2; (e) existence and the action of that which exists are expressed separately; and (f) egocentrism is revealed in subjective reference, spatial representations, notions of time, and in the expression of causality.—S. S. Marzolf.

2167. Olsen, Audun J. (Indiana U.) **The effect of stimulus complexity, reversal and nonreversal shifts, and amount of information feedback on concept attainment at two levels of intelligence and three age levels in children.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5297.

2168. Rankin, Earl F. & Overholser, Betsy M. (U. Kentucky, Coll. Education) **Reaction of intermediate grade children to contextual clues.** *Journal of Reading Behavior*, 1969(Sum), Vol. 1(3), 50-73.—To determine the use of 13 types of contextual cues in relation to reading ability, 208 intermediate grade students were divided into 3 groups on the basis of raw scores on the California Achievement Test and given the Context Test, a cloze test constructed from passages in current 4th grade basals. Each of 13 clue categories involved 1 clue and 10 test items, with 130 items in the test. Results indicate: (a) there is a significant difference in difficulty among the 13 clues, with accuracy ranging from 26-69%; (b) rank order of clue difficulty is consistent among both grade and reading levels; (c) % accuracy for total clues range from 43% (4th grade) to 62% (6th grade); (d) reading level is significantly related to ability to use each of the clues; and (e) differences in responses to clues by grade level can be accounted for by differences in reading ability. (20 ref.)—R. Wiltz.

2169. Shanks, Susan J., Sharpe, Mary R., & Jackson, Bernard R. (Stephan F. Austin State Coll.) **Spontaneous responses of first grade children to diagnostic picture articulation tests.** *Journal of Communication Disorders*, 1970(Aug), Vol. 3(2), 106-117.—Presented pictures selected from 4 diagnostic articulation tests to 24 male and 24 female 1st graders from low and middle socioeconomic homes whether: (a) sex or socioeconomic background influenced the correct, spontaneous naming of the pictures; (b) the number of correct responses elicited by the pictures from each articulation test would be significantly different; and (c) the 4 tests could be considered equivalent forms. Results indicate that socioeconomic background affects children's responses during administration of diagnostic articulation tests. The Photo Articulation Test was the most effective in eliciting spontaneous responses, and a lack of equivalency between the 4 tests was shown.—*Journal abstract*.

Abilities

2170. Adler, Sol. (U. Tennessee, Memorial & Research Hosp., Speech & Hearing Clinic) **Auditory retention ability in five year old lower and middle class children: A pilot study.** *Journal of Communication Disorders*, 1970(Aug), Vol. 3(2), 133-139.—Administered a digit-span retention test and a sentence test incorporating high-value words to 24 5-yr-old children from the middle class and 24 from the lower socioeconomic class. The former test revealed distinct differences between the 2 groups of Ss, whereas on the latter test, both groups performed similarly. It is suggested that a digit-span test score may not truly reflect the language retentive ability of so-called disadvantaged and retarded children. (16 ref.)—*Journal abstract*.

2171. Allott, Nicholas C. (U. Georgia) **The effects of warm-up activities on the verbal creative thinking abilities of disadvantaged first grade children.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5275.

2172. Arnett, Chappelle. (U. Missouri) **Perceptual-motor and motor performance test items for pre-school through grade six children.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5266-5267.

2173. Kaplar, James E. (U. Massachusetts) **Creativity, sex-role preference, and preception of parents in fifth-grade boys.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5689-5690.

2174. Sekyra, Francis & Arnoult, Joseph F. (Mississippi State U.) **Negro intellectual assessment with three instruments contrasting Caucasian and Negro norms.** *Journal of Learning Disabilities*, 1968(Oct), Vol. 1(10), 564-569.—Compared the Stanford-Binet (S-B), 1969 Revision (Form L-M), the WISC, and the Columbia Mental Maturity Scale (CMMS) intelligence scores of 30 rural and 30 urban Negro Ss divided into 3 groups of 20 Ss each from the 2nd, 5th, and 8th grades. Both Caucasian and Negro norms of the S-B were used to study the need for further standardization of Negro Ss on the WISC and the CMMS. Results show significant correlations between the WISC and the S-B (Caucasian norms), with relatively lower correlation between the CMMS and the WISC. When the S-B (Negro norms) were compared to all other instrument scores, they yielded significantly higher MAs, indicating that neither the WISC nor the CMMS is giving an adequate indication of intellectual function for Negroes. It is concluded that "future studies should be made regarding the validity of the CMMS and the WISC scores when assessing members of the Negro population."—M. Maney.

2175. Wood, Rebecca H. (U. Alabama) **Three environmental press variables and their relationship to coping behavior and creativity in children.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5306-5307.

Perception

2176. Berthoud, Myriam & Vurpillot, Eliane. **Influence du nombre de différences sur les réponses "pas pareil" chez l'enfant d'âge préscolaire.** [Influence of the number of differences on the "not alike" responses of school age children.] *Enfance*, 1970(Jan), No. 1 23-30.—Studied the evolution of the criteria for differentiation in perceptual tasks by presenting 4- and 5-yr-old children with pictures to be compared. 5 levels of differentiation (0-4 differences) were introduced into the comparisons. The majority of the youngest Ss responded "alike" no matter how many differences existed. However, many 5 yr. olds adopted adult criteria. Attention is called to the difference between information received and information used.—S. S. Marzolf.

2177. Greenberg, Gordon Z., Bray, Norman W., & Beasley, Daniel S. (U. Illinois) **Children's frequency-selective detection of signals in noise.** *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 173-175.—5 children, median age 7 yr., and 6 adults, median age 20 yr., served as Os in a task requiring the detection of auditory signals presented against a continuous background of noise. 2-alternative, temporal-forced-choice trials of

5-sec duration were presented periodically in blocks of 50 during 2 or 3 1-hr sessions. During a block, some 70% of the signals were of 1000 Hz. and approximately 30% were probe signals of a frequency other than 1000 Hz. After only rudimentary description of the task, Ss performed adequately. Results from children and adults were similar, showing differential detection as a function of signal frequency. The demonstrated frequency selection is consistent with a sensory-filter model of O's auditory behavior.—*Journal abstract.*

2178. Martin, Ruth G. (U. Georgia) **An analysis of three types of visual cues used in word perception under four types of presentation.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5169-5170.

2179. McWhinnie, Harold J. (Ohio State U.) **A factor analytic study of perceptual behavior in 4th and 5th grade children.** *Acta Psychologica*, Amsterdam, 1970(Sep), Vol. 34(1), 89-97.—Used the pretest scores for 95 4th and 5th graders in factor analysis in which 4 and 6 factors were rotated. The tests were a variety of perception, creativity, and esthetic preference measures. The 6 factors to emerge from the pool of 14 variables were: a factor of creativity, a perceptual factor of deductive reasoning, a perceptual factor of inductive reasoning, a measure of perceptual field independence, and 2 esthetic preference factors. In the 4 factor analysis the creativity factor, the 2 perceptual factors, and the esthetic preference factor remained. Results are discussed with implications for art education.—*Journal abstract.*

2180. Museñbova, T. **Genezis otrazheniya prostranstva i prostranstvennoi orientatsii u detei doshkol'nogo vozrasta.** [Origin of the conceptual reflection of space and spatial orientation in children of preschool age.] *Doshkol'noe Vospitanie*, 1970, Vol. 43(3), 36-40.—Results are based on the author's own research.—*I. D. London.*

2181. Nash, Harvey & Harris, Dale B. (California State Coll., Dominguez Hills) **Body proportions in children's drawings of a man.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 85-90.—Found that 49 male and 39 female 1st grade Ss who drew a man on each of 10 successive school days clearly magnified head length and somewhat less clearly diminished leg length. Agreement and self-consistency among Ss were greater for head length than for leg length, possibly due to factors such as the greater attention paid to the head, the obscurement of the trunk-leg juncture by clothing, and the difficulties experienced by a young child in laying out a drawing on a sheet.—*Journal summary.*

2182. Powers, Richard B., Cheney, Carl D., & Agostino, Norman R. (Utah State U.) **Errorless training of a visual discrimination in preschool children.** *Psychological Record*, 1970(Win), Vol. 20(1), 45-50.—Determined the feasibility of H. S. Terrace's (see PA, Vol. 38:536) errorless discrimination technique in training children to make a fine color discrimination. Of 5 3½-5 yr. old children, 3 were trained with traditional discrimination techniques and 2 were trained utilizing Terrace's techniques. No S in the traditional group made the discrimination. Both Ss in the errorless condition were successful in making the discrimination and made the transition to the final performance with very few errors.—*Journal abstract.*

2183. Spearman, Cecile T. (City Coll., City U. New York) **Color-mood association with lighter and**

darker hues of non-racially related colors by young Negro and Caucasian children. *Graduate Research in Education & Related Disciplines*, 1968(Win), Vol. 4(1), 25-37.

2184. Super, Selwyn. **Spatial perception of language symbols and a description of a test designed to assess this function.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Jun), Vol. 46(6), 426-433.—Describes the spatial perception of language symbols against the background of developmental visual cognition. A rationale for the selection of a test of letter recognition as part of the assessment of a child's reading ability is suggested. A simple new test is described in this field, and a report is given and data provided on its administration to 100 children in a normal and a special school population.—*Journal abstract.*

2185. Zucker, Joseph S. & Stricker, George. (Adelphi U.) **Impulsivity-reflectivity in preschool Head Start and middle class children.** *Journal of Learning Disabilities*, 1968(Oct), Vol. 1(10), 578-584.—Determined differences between lower class Negro and middle class white children in perceptual tempo, and investigated the adequacy of J. Kagan's Matching Familiar Figures Test (MFF) for children 2 yr. younger than those used by Kagan. Based on previous findings that culturally deprived children fail more frequently in school and have more difficulty learning to read, it was hypothesized that 30 preschool lower class (LC) Negro Ss would have shorter latencies and more mean errors on the MFF test than 30 middle class (MC) white Ss. Results, based on t scores between the means of the 2 groups, show that: (a) for comparison of girls or boys, the only significant difference was between LC and MC girls on errors with all other differences in the predicted direction; (b) for overall comparisons, LC Ss made problem solving decisions significantly faster than MC Ss, and also made significantly more errors; and (c) boys of both groups are not significantly different from girls of both groups. Results suggest that the MFF technique is appropriate for preschool Ss, although perhaps it is too difficult in its present form (18 ref.).—*M. Maney.*

Personality

2186. Dermine, Ann M. (Cornell U.) **Relationship between values and behavior: An experiment.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5532.

2187. Muto, Michiyo & Murase, Takao. [A methodological study concerning types of children with school phobia.] *Japanese Journal of Clinical Psychology*, 1968(Jul), Vol. 7(2), 95-106.

2188. Schwendiman, Gary; Larsen, Knud S., & Parks, Chris. (Marshall U.) **Birth order, aggression training and authoritarianism.** *Psychological Record*, 1970(Win), Vol. 20(1), 69-71.—Since 1st-born children are thought to be serious, studious, adult-oriented, and more punitively treated than 2nd-born children who are generally considered receiving more nurturance from parents, it was hypothesized that 1st-born children would score higher on 3 personality scales measuring dogmatism, authoritarianism, and child aggression-training. In opposition to the prediction, 2nd-born children scored significantly higher on both dogmatism and child aggression-training.—*Journal abstract.*

Social Behavior

2189. Artemova, L. **Formirovanie obshchestvennykh chert kharaktera v protsesse vzaimootnoshenii starshikh doshkol'nikov.** [Formation of social traits of character in the process of interrelationships of older preschoolchildren.] *Doshkol'noe Vospitanie*, 1970, Vol. 43(3), 45-51.—Reports the results of research on the "organization of certain complexes of interrelationships" among older preschoolchildren which have a favorable influence on the development of positive social traits. The outcome of such efforts depends on initial attitudes to rules, and the way social attitudes and interrelationships develop for certain individual children in a group, since their behavior has a great influence on others.—*I. D. London.*

2190. Elliott, Rogers & Vasta, Ross. (Dartmouth Coll.) **The modeling of sharing: Effects associated with vicarious reinforcement, symbolization, age, and generalization.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 8-15.—4 groups of 5-, 6-, and 7-yr-old children each matched for age, sex, and the sharing of candy were shown either a model sharing, a model sharing and being rewarded, a model sharing, being rewarded, and told why he was rewarded, or no model. Posttests on similar and different kinds of sharing resulted in significant effects of modeling, with the reinforcement-with-instruction proving most powerful. Rewarded modeling was no more effective than modeling without reward. Sharing was significantly and directly associated with age. The sexes were the same in total amount shared but different with respect to which resource they preferred to share. Little generalization of modeling effects to other kinds of altruism occurred.—*Journal abstract.*

2191. Lepper, Mark R., Zanna, Mark P., & Abelson, Robert P. (Stanford U.) **Cognitive irreversibility in a dissonance-reduction situation.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 191-198.—Tested the proposition that successful dissonance reduction tends to be irreversible by presenting consonant information just before or just after a dissonance-arousing situation. 71 kindergarteners were forbidden from playing with an attractive toy, by a mild or severe threat. Orthogonally, they were given a social consensus justification for obedience, either before or after the temptation period or never. Without the consensual justification, mild-threat Ss derogated the forbidden toy more than severe-threat Ss (the standard dissonance result). If the justification came before the temptation, mild-threat Ss did not derogate the toy, but when justification followed temptation, derogation was as high as with no justification. Results support the irreversibility hypothesis. (25 ref.)—*Journal abstract.*

Parent-Child & Family Relations

2194. Austin, Alice. (Smith Coll., School for Social

Work) **Maternal attitudes and the development of learning disabilities in black children.** *Smith College Studies in Social Work*, 1970(Jun), Vol. 40(3), 198-210.—Studied the child-rearing goals and expectations of mothers of children with learning problems in a comprehensive health clinic for culturally and economically deprived black children. The sample consisted of 15 mothers and 10 boys in each of the groups. Results showed that mothers of boys with school problems expected their children to show earlier competence in areas such as self-feeding, toilet training, and dressing. Mothers of problem children discouraged energetic activities such as climbing, jumping, and sports. These mothers were also more demonstrative physically rather than verbally concerning affection. Mothers of non-problem children relied on verbal scolding for inappropriate behavior, while mothers of problem children relied primarily on spanking.—*M. W. Linn.*

2195. English, George E. (U. Wisconsin) **Children's perception of parents in normal families containing an aggressive, withdrawn, or nondeviant child.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5686.

2196. Heaps, Richard A. (Brigham Young U.) **Some relationships among children's perceptions of parental characteristics.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 7-11.—Tested the assumption that a child's perception of the mother could be used to infer the father's child-rearing practices as well. Using semantic differentials with 63 elementary school children, it was found that: (a) there is a positive relationship between girls' perceptions of their mothers' and fathers' characteristics, but there is no such relationship for boys; and (b) for girls, perceptions of the concept "parents" can be used to make inferences about the perceived characteristics of both parents, but for boys, such perceptions cannot be used to make inferences about either individual parent. It is concluded that findings point out the significance of analyzing developmental issues separately for both parent and child sex groups.—*Journal summary.*

2197. Heeren, Steven D. (U. Kansas) **Entrepreneurial vs. bureaucratic fathers as related to family structure, happiness, and two measures of independence.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5674-5675.

2198. Herzog, Elizabeth & Sudia, Cecelia E. **Fatherless homes: A review of research.** *Children*, 1968(Sep), Vol. 15(5), 177-182.

2199. Magaro, Peter A. (U. Maine) **The connotative meaning of parent-child relationships as related to perceived maternal warmth and control.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 25-35.—Perceived maternal control and warmth, as assessed by the Parent Attitude Research Instrument and Parent-Child Interaction Rating Scale, were related to the connotative meaning of parent-child scenes denoting affection, censure, and neutral conditions. Results from 60 male undergraduates support previous work in that connotative meaning on the semantic differential elicited more negative evaluations for low warmth groups than high warmth groups under censorious conditions. This effect was especially evident for the low warmth-low control group (ignored) on paternal censure. There were no group differences on the potency and activity factors. Differences in the present results and the results reported with schizophrenics support an alternative position to the

social censure hypothesis proposed by A. H. Buss and P. J. Lang. (16 ref.)—*Author abstract.*

2200. Wakefield, William M. (Richmond Coll., City U. New York) **Awareness, affection, and perceived similarity in the parent-child relationship.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 91-97.—Data from 60 adolescents and their parents failed to support hypothesized positive relationships between parental awareness, parent-cathexis, and perceived similarity to parents. Findings suggest that, although parents are able to predict their adolescents' responses to a problem checklist with accuracy greater than chance, and mothers appear more accurate than fathers, this form of "parental awareness" appears unrelated to the degree to which the adolescent likes the parent or sees himself as similar to that parent.—*Journal summary.*

ADOLESCENCE

2201. Greenfeld, Norman & Finkelstein, Elsie L. (State U. New York, Albany) **A comparison of the characteristics of junior high school students.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 37-50.—Compared some personal-social characteristics of a sample of 211 junior high school students with a somewhat similar sample (N = 250) examined 30 yr. ago. Inventories, controlled observations, objective test scores, ratings, and other data provided a general picture of Ss' familial relationships, home and community background, areas of interest, and emotional and imaginative life. Differences between the 2 samples seem to be reflections of technological and/or cultural changes in the structure of the immediate societal environments.—*Author abstract.*

2202. Hannon, John E. & Kicklighter, Richard. (Stockton State Hosp., California) **WAIS versus WISC in adolescents.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 179-182.—Administered the WAIS and the WISC to 120 16-yr-old students in counterbalanced order. About 1/2 of the Ss were of average intelligence (IQ = 80-119), 1/4 less than average (IQ below 80), and 1/4 above average (IQ above 120). Analyses of variance indicate significance for order of administration and intelligence level. Higher scores were produced by the WAIS in the less-than-average group, and by the WISC in the other groups. Intertest differences may be masked when groups of varying intelligence levels are combined in a reliability sample.—*Journal abstract.*

2203. Marshall, W. A. & Tanner, J. M. (U. London, England) **Variations in the pattern of pubertal changes in boys.** *Archives of Disease in Childhood*, 1970, Vol. 45(239), 13-23.—Presents longitudinal data on physical changes in 228 pubertal boys. Maximum growth rate was 14.1-14 yr. Genitalia reached maturity between 13-17 yr. Peak height velocity was reached, on the average, nearly 2 yr. later in boys than in girls.—A. B. Warren.

2204. Milner, Esther. (Brooklyn Coll., City U. New York) **Extreme cultural discontinuity and contemporary American adolescent behavior: A relational analysis.** *International Journal of Social Psychiatry*, 1969(Fal), Vol. 15(4), 314-318.—Discusses the idea that the magnitude of cultural discontinuities in the individual American male and female life-careers has recently markedly increased for a number of contributory reasons, chief among them increasing population

and urbanization, and the "2nd industrial revolution." Because adolescence is the period of transition from childhood status and roles to adulthood status and roles, adolescents are most immediately affected by such discontinuities, chiefly by interiorization of them in the form of inner conflicts. Much of the current behavior of American boys and girls reflects reaction to their respective sex-groups' socially induced conflicts, and may serve as a harbinger for other technologically advanced and advancing countries.—*Journal abstract.*

2205. Phelan, Gladys K. (Florida State U.) **Comparative analysis of selected developmental tasks at the beginning of adolescence.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5566.

2206. Popović, Slobodan. **Contribution à l'étude du jugement moral chez la jeunesse scolaire.** [A contribution to the study of moral judgment of young students.] *Scientia Paedagogica Experimentalis*, 1968, Vol. 5(1), 91-100.—Collected information about the moral attitude of 144 13-16 yr. old pupils, towards the notion of property of a found object. After hearing a story about 2 boys who found eggs and sold them, Ss answered 2 questions: (a) What do you like in this tale? and (b) What would you do in these circumstances? The analysis of the answer reveals 2 types of attitude: 60.3% of the Ss were of the opinion that the appropriation of a found object is a theft; and 35.7% of the Ss thought that it is not. It is concluded that the latter attitude is due to a convention which involves the use of the verb, to take, and a need to justify the attitude they would adopt themselves in a similar situation.—*English summary.*

2207. Raphael, Aloysius. (Bishop Loughlin Memorial High School, Brooklyn, N.Y.) **The adult and the teenage: A time for revision.** *Catholic Educator*, 1969, Vol. 40(3), 40-43, 51-52.—The teen-age subculture is composed of 25 million youngsters of whom 1 1/2 million are unschooled, unskilled, and unemployed. It represents an \$11 billion market. It has its own magazines, movies, TV, and radio programs. Its values—happiness, through euphoric irresponsible noninvolvement, through objects, money, and status—have little place for religion or dedicated work. Some drinking and smoking serve as acts of rebellion against authority. Some needs of the teen-ager include physical action, sexual gratification, personal approval, and adults who practice what they counsel. The real guide to teen-age personality development knows that truth and virtue are shared rather than conferred, that obedience is earned, and that guidance is encouragement toward realization of potential. (17 ref.)—A. M. Cawley.

2208. Song, R. H. (Wisconsin State U., Whitewater) **Self-concept variables of delinquent boys from intact homes and broken homes.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 150-152.—Love and affection are indispensable in development of positive and accurate self-concept variables. Children from broken homes lack these essential ingredients. Deprivation and rejection may result from broken homes. It was hypothesized but not confirmed that boys from intact homes would show relatively higher self-concept, self-acceptance, and ideal-self scores. Ss were 100 Caucasians born in the United States. Ages were 13-17, and WISC IQs ranged from 80-125. (27 ref.)—R. D. Nance.

2209. Winter, Gerald D. & Nuss, Eugene M. (Eds.) **The young adult: Identity and awareness.** Glenview, Ill.: Scott, Foresman, 1969. 343 p.—"The primary

purpose of this book of selected readings is to explore the nature of adolescence in a psycho-social perspective.... The readings vary in point of view and in approach to the problems and steps to correct them.... The book is intended to be a supplement to the main text." Nearly 30 contributors delineate problems from fads and values to drugs and racism.—A. M. Cawley.

ADULTHOOD & OLD AGE

2210. Giffin, Kim. (U. Kansas, Communication Research Center) **Personal trust and the interpersonal problems of the aged person.** *Gerontologist*, 1969(Win), Vol. 9(4, Pt. 1), 286-292.—Discusses the idea that increased interaction on the part of those who are troubled, anxious, or disturbed can produce increased personal satisfaction and adjustment to reality. In the case of aged persons, an increase in interpersonal communication can produce a heightened sense of importance, increased awareness of the world, and a greater sense of responsibility for enjoyment and personal satisfaction of others. Research focused on interpersonal trust as a factor in human interaction is discussed. Findings suggest that increased trust is the key to increased interaction between aged persons and their immediate social environment. (38 ref.)—*Journal summary*.

SOCIAL PSYCHOLOGY

2211. Bennis, Warren G. (State U. New York, Buffalo) **A funny thing happened on the way to the future.** *American Psychologist*, 1970(Jul), Vol. 25(7), 595-608.—Identifies 7 types of responders to the present "spastic times": militants, apocalypics, regressors, retreaters, historians, technocrats, and liberal-democratic reformers. New dilemmas, perspectives, and forecasts for public bureaucracies are reviewed. It is concluded that "contradictory and confusing tendencies" can be expected in the future and will include more of the following: (a) self- and social consciousness concerning governance, (b) participation in governance by those served and serving, (c) formal processes of conflict resolution, (d) confrontations when bargaining fails, (e) "attention to moral-ethical issues relative to technical efficiency imperatives," and (f) "rapid turnover and varying relationships within institutions." (31 ref.)—P. McMillan.

2212. Ehrlich, Paul R. & Ehrlich, Anne H. (Stanford U.) **Population, resources, environment: Issues in human ecology.** San Francisco, Calif.: W. H. Freeman, 1970. 383 p. \$8.95.

2213. Krause, Merton S. (Inst. for Juvenile Research, Chicago, Ill.) **Use of social situations for research purposes.** *American Psychologist*, 1970(Aug), Vol. 25(8), 748-753.—Discusses the fact that most psychological research must be done in relatively few paradigmatic types of social situations. An investigator's prior commitment to a theory or social problem leads him to prefer situations which embody his variables at the proper levels. Insuring the reliability of experimental control over these variables requires that the situation be plausible to the Ss involved. Such plausibility dictates (a) which intrusions will be tolerable, and (b) what manipulations can be used, and (c) what variables can be validly measured. Only familiarity with Ss' perceptions

of situations can properly guide a researcher's intrusions on and selections of situations for research purposes. (33 ref.)—*Author abstract*.

2214. McGinnies, Elliot. (U. Maryland) **Social behavior: A functional analysis.** Boston, Mass.: Houghton Mifflin, 1970. xi, 459 p. \$8.50.—Presents a factual introduction to the field of social psychology, including a discussion of major problems and their scientific solutions. Contents include a cross-section of modern research results and chapters on behavior shaping and socialization, social factors in perception and judgment, group behavior and Group \times Individual interactions, language and communication, and games, strategies, and decisions.

2215. Plon, Michel. (Centre National de la Recherche Scientifique, Sorbonne, France) **Quelques aspects des processus d'identification dans une situation expérimentale.** [Several aspects of the identification process in experimental situations.] *Bulletin Centre d'Etudes et Recherches Psychotechniques*, 1969(Apr), Vol. 18(2), 99-116.—On the basis of a certain number of theoretical postulations, experimental social psychology sets aside important questions of identification by substituting the uncertainties of the interchangeability of roles. The theoretical concept proposed shows that the identification process necessarily invoked for securing certain demands of the experiments in this regard, cannot be considered a functioning mechanism. It is predicted that in certain types of social relations, the identification process which is impossible as such will be replaced by speech or behavioral transformations. The limited experimental illustration proposed tends to support certain theories, however, further development in improvement of experimentation is advised. (English summary)—P. R. Shibleski.

2216. Strackbein, Oscar R. **Permissiveness.** New York, N.Y.: Vantage, 1970. 185 p. \$4.95.

CULTURE & SOCIAL PROCESSES

2217. Barton, Allen H. (Columbia U.) **Bringing society back in: Survey research and macro-methology.** *American Behavioral Scientist*, 1968(Nov), Vol. 12(2), 1-9.—Examines survey design methods which include social structure and presents "examples of some of the social processes which they reveal." The methods are: (a) measurement of perceived interpersonal environment, (b) use of cluster samples, (c) use of sociometric samples, and (d) obtaining survey data on institutional settings and interinstitutional relationships. The contextual data obtained by the surveys permit an analysis of relationships at various levels, from the individual to the aggregate. It is suggested that the confrontation of traditional sociological concepts with data at appropriate levels will lead to the clarification of concepts necessary "for the development of useful segments of general theory."—G. Steele.

2218. Jahoda, Gustav. (U. Strathclyde, Glasgow, Scotland) **Supernatural beliefs and changing cognitive structures among Ghanaian university students.** *Journal of Cross-Cultural Psychology*, 1970(Jun), Vol. 1(2), 115-130.—280 male Ghanaian students were administered a number of instruments to assess correlates of their supernatural beliefs. Among all Ss extent of belief was related to scores on Rotter's Internal-External Control Scale, but unrelated to tribe, family literacy, or parental occupation. On other variables marked con-

trasts emerged according to age. The findings are interpreted in terms of a basic change in cognitive structure in the direction of a coexistence between African and Western ideas and beliefs. (34 ref.)—A. Krichev.

2219. Mathieu, M. **Le service militaire comme situation de passage.** [Military service as a rite of passage.] *Information Psychologique*, 1968(Apr), No. 30, 53-64.—Evidence is adduced for the theory that military service used to serve as an initiation ceremony for adolescents. It is suggested that this function will disappear in our time, perhaps to be replaced by universal secondary education. (15 ref.)—S. G. Vandenberg.

2220. Schwartz, David C. (U. Pennsylvania, Foreign Policy Research Inst.) **On the ecology of political violence: "The long hot summer" as a hypothesis.** *American Behavioral Scientist*, 1968(Jul), Vol. 11(6), 24-28.—Examined the relationship between violence and temperature within and between nations. Feierabend's Cross-National Data Bank of Political Instability Events provides a basis for dividing 340 violent events into 5 classifications of political violence. Results support the hypothesis that "political violence is disproportionately associated with periods of moderate temperature" and occurs primarily in nations "significantly more developed than other nations." It is concluded that: (a) types of political violence are "differentially distributed in space," and (b) "some climatic variables are significantly related to dimensions of violent behavior." Further research on the relevance and operation of natural ecological factors on the "social structure and psycho-political conditions associated with political violence" is suggested.—G. Steele.

Ethnology

2221. Daniel, Jack L. (U. Pittsburgh) **The facilitation of white-black communication.** *Journal of Communication*, 1970(Jun), Vol. 20(2), 134-141.—Studied verbal cues emitted by white speakers leading to ineffective communication between white and black people. Interviews were conducted with black people, who were requested to list verbal indices they use in judging the sincerity of a given white speaker. It appeared that white speakers trying to show an affinity for black people and an understanding of black experiences often make the black auditor suspicious of their sincerity. Reasons offered are the use of the verbal index "you people," the use of stereotypes of blacks, and saying things to indicate they do not understand the black experience.—P. Federman.

2222. Meredith, Gerald M. (U. Hawaii) **Acculturation and personality among Japanese-American college students in Hawaii.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5677-5678.

Social Structure & Social Role

2223. Danzger, Herbert. (Lehman Coll., City U. New York) **A quantified description of community conflict.** *American Behavioral Scientist*, 1968(Nov), Vol. 12(2), 9-14.—Describes an instrument to examine community conflict and presents examples of its utility. Examination of civil rights conflict in 19 communities over a 10-yr period indicates that: (a) vertical ties play an important part in conflict; (b) when issues change,

groups of different breadth become involved; and (c) groups defending the status quo rely on organizations, while those attacking the status quo rely primarily on associations. Results demonstrate that H. Long and R. Warren's conceptions of community structure may be more carefully specified through use of this instrument. Some preliminary findings on the relationship of community power structure to community conflict where this instrument was utilized indicate some further uses. (21 ref.)—*Journal summary.*

2224. Singh, U. P. & Bhushan, L. I. (Bhagalpur U., India) **Stereotypes among Hindu subcastes: An interperceptual analysis.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 153-159.—In present-day Indian society 3000 castes exist, each serving as a separate social unit. Data for 1072 persons, gathered at the time of the 1967 general elections, are presented. Respondents belonged to the various rural and urban areas of 9 districts in Bihar. Anonymity was ensured. A tendency toward ethnocentrism was noted in Brahmins, Kayasthas, Rajputs, and Yadavas. Political and local leaders serve as 1 source of caste-stereotyping. (16 ref.)—R. D. Nance.

Religion

2225. Bier, William C. (Ed.) **Psychological testing for ministerial selection.** New York, N.Y.: Fordham U. Press, 1970. xiii, 271 p. \$8.50.—Presents proceedings from a symposium which brought together researchers and testers concerned with psychological evaluation, follow-up counseling, and mental health of candidates for the ministry.

2226. Bronson, Oswald P. (Interdenominational Theological Center, Atlanta, Ga.) **Religious learning through involvement in social conflict and service.** *Religious Education*, 1970(Mar), Vol. 65(2), 120-124.—Social conflict can be a context for learning that involves religion, a stimulus for social change, a basis for eliminating distortions and misinformation, the ground for teaching the place of power and the need to structure power systems, and a basis for integrative and unifying tendencies. Elements defining religious learning in a conflict situation include its confrontational, crisis, redemptive, participative, and ecumenical character. "The thrust of creative religious learning through and beyond the complexity of chaos and the confusion in circumstances of conflict authenticates the human side of greatness." In conflict the mediator aims to strip the situations of aggressive overtones so that contending parties can use "facts" rather than "emotions" as guidelines.—S. E. Gavin.

2227. Gilbert, Albin R. (West Virginia Wesleyan Coll.) **Identifying the mystic variable.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 139-146.—Identifying the mystic variable is a needed counterpart of identification of the religious variable. Characteristics of the mystic frame of mind and the ways toward mystic attainment are set forth. Major aspects of the topic discussed include phenomenology of mystical experience, drug revelations, quietism, psychology of the active way, and mysticism for the space age. As he explores space, man will become more mystical. (17 ref.)—R. D. Nance.

2228. Kelsey, Morton T. (Notre Dame U.) **God, education and the unconscious.** *Religious Education*, 1970(May), Vol. 65(3), 227-234—Actions reveal a per-

sonality theory more tellingly than do verbal expressions. Until implicit attitudes are stated, divergencies between them and a consciously held set of assumptions cannot be reconciled. The Aristotelian view of human nature, prevalent in today's society, can be contrasted with that of Jung, who emphasized psychic and biological inheritance and structure. Jung considers man to be caught between 2 worlds—a world of space and time and a world of nonphysical reality, the latter being the collective unconscious or the objective psyche. Acceptance of the basic epistemology of Plato, upon which Jung's formulation rests, can result in education adequate to the totality of the person and to the 2 kinds of phenomenal reality he experiences. Educators becoming aware of both realities in themselves is essential to adequate religious education.—S. E. Gavin.

2229. Malecki, John J. (U. Oregon) **Life history approach to the study of crises in religious life.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5693.

2230. Mitchell, Kenneth R. (Menninger Foundation, Div. of Religion & Psychiatry, Topeka, Kan.) *Journal of Pastoral Care*, 1968(Sep), Vol. 22(3), 129-138.—Discusses the role, development, and maintenance of defense mechanisms in the clergy. The need for self-examination, methods for dealing with defenses, follow-up, and psychological distance are discussed. Several examples from group training sessions are included.

2231. Uleyn, Arnold. (28 Wilhelmijnasingel, Nijmegen, Belgium) **Pastoralpsychologische Bemerkungen zur Schuld und Schuldabwehr.** [Pastoral psychological remarks concerning guilt and guilt defenses.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 216-220.—Discusses guilt and guilt-reducing defense mechanisms in relation to religion and theology.

Cross Cultural Comparison

2232. Barron, Frank & Young, Harben B. (U. California, Santa Cruz) **Rome and Boston: A tale of two cities and their differing impact on the creativity and personal philosophy of Southern Italian immigrants.** *Journal of Cross-Cultural Psychology*, 1970(Jun), Vol. 1(2), 91-114.—Various psychological tests and questionnaires were administered to 95 Boston adolescents whose grandparents had migrated from Southern Italy around 1900 and 125 similar adolescents in Rome. The Boston Ss were found to be more religiously orthodox and socially conservative. The Rome group was also higher in ideational fluency, originality, and flexibility, though not in intelligence. (21 ref.)—A. Krichew.

2233. Diab, Lutfy N. (American U., Beirut, Lebanon) **A study of intragroup and intergroup relations among experimentally produced small groups.** *Genetic Psychology Monographs*, 1970(Aug), Vol. 82(1), 49-82.—Tested the cross-cultural validity of a number of generalizations on group relations resulting from studies of homogeneous ingroups in the Western culture. In line with the experimental "camp" studies of Sherif, the present study was planned in successive stages but utilized nonhomogeneous non-Western ingroups (N = 18 9.6-11.11 yr. old Lebanese boys, 10 Christians and 8 Moslems). In general, present results corroborated previous findings on group relations. However, some cross-cultural differences in the kinds of group structure

and norms which developed, both before and after the stage of intergroup relations, were noted and are discussed.—Author abstract.

2234. Engle, Gerald. (Purdue U.) **Comparison between Americans living in Israel and those who returned to America: III. Predictions about America and Israel.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 117-123.—Americans who left Israel demonstrate inconsistent behavior may be maintained without dissonance causing either change of belief or behavior, by accepting an ancillary belief requiring immediate action. Returnees to American stress funds are the most important requisite for successful "aliya," enabling many who plan to relocate in Israel to work in America. Both groups stress reasons for staying in Israel. Yet, those who returned to America want their children to study in Israel, a temporary relationship, while permanent residents hope their children will live and marry in Israel, becoming permanently attached to the land.—Author abstract.

2235. Ginsburg, Gerald P., McGinn, Noel F., & Harburg, Ernest. (U. Nevada) **Recalled parent-child interaction of Mexican and United States males.** *Journal of Cross-Cultural Psychology*, 1970(Jun), Vol. 1(2), 139-152.—The Parent Image Differential data obtained from 91 American college males and 95 Mexican college preparatory males were factor analyzed. The factors of potency (treated, taught, and disciplined) and ambivalence vs. inclusion-understanding (taught) were very stable, appearing across both groups and in both mother and father versions of the concepts. A number of other dimensions emerged but were specific to 1 culture or the sex of the parent. Cross-cultural differences are discussed. (28 ref.)—A. Krichew.

2236. Kuczynska-Stoffels, M. J. (U. Lovanium, Kinshasa, Congo) **Responses figuratives congolaises au Lowenfeld mosaic test.** [Figurative responses of Congolese to the Lowenfeld Mosaic Test.] *Revue de Psychologie Appliquée*, 1970, Vol. 20(1), 41-57.—Reports results of administering the Lowenfeld Mosaic Test to 662 Congolese 7-30 yr. old Ss (313 were between the ages of 8-10 inclusive). The proportion of figurative responses was low. Specific figures of 10-yr-old Congolese are found among 5-yr-old Europeans. The theme most common both in Europe and in the Congo is that of a "home." Distinctive themes preferred by Europeans—trees, plants, flowers, animals, and human beings—do not seem to inspire Congolese Ss.—K. J. Hartman.

2237. Mehryar, A. H. (Pahlavi U., Shiraz, Iran) **A cross-cultural investigation of Eysenck's hypothesis regarding the relationship between personality and attitudes.** *British Journal of Social & Clinical Psychology*, 1970(Sep), Vol. 9(3), 216-221.—Investigated Eysenck's hypothesis concerning a negative correlation between extraversion and tender-mindedness. Exp. I involved 106 18-29 yr. old British students, who were given Eysenck's Inventory of Social Attitudes, the MPI (short form), and Part I of Richardson's British version of the Study of Values. In Exp. II, 69 19-24 yr. old Iranian students were given the Eysenck Personality Inventory, Melvin's Inventory of Social Attitudes, and the Allport-Vernon-Lindzey Study of Values. Results failed to reveal any significant correlation between extraversion and tender-mindedness. There was, however, a significant positive relationship between tender-mindedness and religionism as measured by the Study of Values. Results are discussed in light of similar findings reported by A. W.

Siegmán and possible reasons for the failure of Eysenck's main hypothesis are suggested. (27 ref.)—*Journal abstract*.

2238. Porat, Avner M. (Edward N. Hay & Assoc., Chicago, Ill.) **Cross-cultural differences in resolving union-management conflict through negotiations.** *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 441-451.—Examined cross-cultural behavioral differences in a conflict resolution situation in Denmark, Spain, Sweden, Switzerland, and the United Kingdom. A union-management negotiation exercise was the basis for the data provided by 260 managers in the 5 countries. The effect of cultural differences on strategy development, negotiating behavior and outcomes, and role perception was examined. Findings point to a relationship between the countries' economic and social environment and behavior in conflict situations. With increase in economic level, an increase in emphasis on welfare benefits and in time needed to resolve the conflict is noticed. Differences between the countries advise against collapsing of samples of geographic proximity or assumed cultural similarities. (22 ref.)—*Journal abstract*.

2239. Schneider, John M. & Parsons, Oscar A. (U. Oklahoma, Medical Center, Oklahoma City) **Categories on the locus of control scale and cross-cultural comparisons in Denmark and the United States.** *Journal of Cross-Cultural Psychology*, 1970(Jun), Vol. 1(2), 131-138.—Nearly 500 American and Danish university students were administered a forced-choice locus of control scale and filled them out for other societies as they perceived them. Significant differences were found between the groups of students, particularly with regard to the ratings of other societies. The results support the notion that locus of control studies are valuable tools in cross-cultural research.—A. Krichew.

2240. Sundberg, Norman D. & Tyler, Leona E. (U. Oregon) **Awareness of action possibilities of Indian, Dutch, and American adolescents.** *Journal of Cross-Cultural Psychology*, 1970(Jun), Vol. 1(2), 153-157.—24 boys and 24 girls from each country answered a questionnaire which asked them to list as many occupations, free-time activities, and acquaintances as they could. The Dutch were found to be highest on awareness of occupations, the Americans more oriented toward free-time activities and peer culture. School and environmental influences on personal possibilities are discussed.—A. Krichew.

2241. Szalay, Lorand B. & Lysne, Dale A. (Center for Research in Social Systems, Washington, D.C.) **Attitude research for intercultural communication and interaction.** *Journal of Communication*, 1970(Jun), Vol. 20(2), 180-200.—An analytic method focusing on the denotative, referential meaning was applied to universally approved value concepts, e.g., freedom, equality. United States and Korean groups were tested. The analysis indicated different culturally specific denotative components. The findings support Sapri's observation about the deceptive nature of universally approved labels to which people attach different interpretations. (28 ref.)—P. Federman.

2242. Varga, Károly. (Hungarian Academy of Science, Budapest) **The view of life of Hungarian students: An international comparison.** *Journal of Cross-Cultural Psychology*, 1970(Jun), Vol. 1(2), 169-176.—Morris' Ways to Live questionnaire was administered to 427 male Hungarian students. Results showed they

value creative-humanistic life styles, reject religion, and are indifferent to individualistic ways of life. Comparison with previously published data suggests they are closest to American students, but are more inflexible and collective-minded.—A. Krichew.

2243. Weisskopf-Joelson, Edith. (U. Georgia) **On surrender.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 57-66.—While modern alienated man longs to surrender to an entity which transcends his self, Western culture views such surrender as undesirable and, thus, blocks important avenues to mental health. Oriental acceptance of self-renunciation is compared with Occidental individualism. Suggestions made by a Chinese-American O are quoted, stressing the importance of turning down our excessive self-reliance in favor of mutual dependency.—*Journal summary*.

Family

2244. Bailyn, L. (Massachusetts Inst. of Technology, Educational Research Center) **Career and family orientations of husbands and wives in relation to marital happiness.** *Human Relations*, 1970(Apr), Vol. 23(2), 97-113.—Analyzed questionnaire data from 209 couples in terms of conventional (husband career, wife home) and coordinate (husband and wife career) patterns. Importance of husband's adjustment to wife's efforts for career are emphasized. More successful patterns are those in which wife's position is opposite to husband's mother when he was growing up—when wife has a career and mother did not and vice versa. Attitudes of a couple's circle of social contacts are also important. The husband's mode of integrating family and work is crucial for the success of any attempt of the wife to include a career in her own life. (19 ref.)—W. W. Meissner.

2247. Orden, Susan R. & Bradburn, Norman M. (U. Chicago) **Working wives and marriage happiness.** *American Journal of Sociology*, 1969(Jan), Vol. 74(4), 392-407.—Discusses "the effects of a woman's work status on her marriage and suggests that a woman's freedom to choose among alternative life styles is an important predictor of her own and her husband's happiness in marriage." 781 husbands and 957 wives were interviewed. Problems inherent in previous studies were overcome by the inclusion of: (a) husband's attitudes, (b) distinction between choice and necessity in entering the labor market, and (c) positive aspects of marriage. 3 alternatives are open to married women: work in the home, work in the labor market, and leisure activities. It is concluded that when there are no preschool children in the family, the "labor market choice is generally associated with a higher balance between satisfactions and tensions for both husbands and wives."—G. Steele.

Social Change & Social Programs

2248. Lipset, Seymour M. (Harvard U.) **American**

student activism in comparative perspective. *American Psychologist*, 1970(Aug), Vol. 25(8), 675-693.—Reports a seminar on student activism, focusing on its causes in the United States. Sources of political activism among students are discussed including the race issue and Vietnam. Among motivating factors of student unrest are: (a) frustration of the present-day student role, (b) idealism of students, (c) existence of youth as a separate social category, (d) increasing competition because of larger number of students, (e) the fact that students are considered "juveniles sociologically and are often treated as such legally," (f) political character of some universities, and (g) geographic mobility which is conducive to conversion to new beliefs. Although the majority of students are politically inactive, it is concluded that the effects of activism on the outlook of future generations must be evaluated. An abbreviated transcript of the discussion period is presented.—P. McMillan.

2249. **Menninger, W. Walter. Student demonstrations and confrontations.** *Menninger Quarterly*, 1969(Spr), Vol. 23(1), 1-14.—Discusses student demonstrations from the standpoint of communications with 3 component parts: the sender, the receiver, and the interactive process. 2 extreme responses, excessive restriction and permissiveness, are discouraged, and it is suggested that principles appropriate in responding to these conflicts include: (a) understanding the message, (b) recognizing the importance of expectations and mutual respect, (c) acknowledging the inevitability of change, and (d) realizing the struggle of the adolescent with his aspirations. Some specific suggestions for coping with potential violence are also made. It is concluded that the basic difficulty in dealing with confrontations stems from the fact that they produce an emotional reaction which must be recognized and dealt with to the extent that it interferes with rational resolutions.—M. Maney.

2250. **Spain, David H. (Northwestern U.) Achievement motivation and modernization in Bornu.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5340.

2251. **Special Committee on Campus Tensions. Campus tensions: Analysis and recommendations.** *American Psychologist*, 1970(Aug), Vol. 25(8), 694-726.—Presents the report of the Special Committee on Campus Tensions developed from commissioned papers, case studies, interviews, meetings, and campus visits. An analysis is made of how the campus community (students, faculty, administrators, and trustees) perceives the causes of campus tensions and problems facing colleges and universities. 40 recommendations for easing campus tensions, including suggestions about institutional goals, governance, and the roles and responsibilities of students, faculty, administrators, and trustees are discussed. (21 ref.)—R. Quick.

2252. **Trankell, Ingrid & Trankell, Arne. (U. Stockholm, Inst. of Education, Sweden) Problems of the Swedish gypsies.** *Scandinavian Journal of Educational Research*, 1968, No. 3-4, 141-214.—Presents the results of a 2-yr research project on Swedish gypsies which: (a) reviews their origin and history, (b) describes the reasons and effects of their disintegration in modern Sweden, (c) discusses the bringing up of children in the gypsy community, and (d) reports on a program to integrate them into modern society. (15 ref.)

SEXUAL BEHAVIOR

2253. ———. **Seminar on Hedonistic Sex, Mutual Affection Sex, and Bible Sex: Report from Religious Education Association Annual Convention.** *Religious Education*, 1970(Mar), Vol. 65(2), 170-176.—Meaning of and relationships in sexuality, needs and status of the adolescent, homosexuality, and celibacy served as major leitmotifs. Discussion revealed consensus of sexuality as the total personality identity of the individual, the sum of his learning experiences as a male or a female, what the person is, rather than that which he has. Attitudes toward homosexuality as a depraved and perverse state do not help individuals; the fact that little is known about genuine scales of masculinity and femininity should temper judgment. While a minority held that celibates could probably not live a fulfilled life, the majority accept the possibility of personality fulfillment in celibacy that is lived within a framework of giving service to others.—S. E. Gavin.

Birth Control & Abortion

2254. **Insko, Chester A., Blake, Robert R., Cialdini, Robert B., & Mulaik, Stanley A. (U. North Carolina) Attitude toward birth control and cognitive consistency: Theoretical and practical implications of survey data.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 228-237.—Interview assessment of 47 attitude-belief-attitude bands revealed significantly consistent family-planning attitude structures among lower socioeconomic black (N = 190) and white (N = 66) females. In addition, users of birth control techniques were found to have significantly more consistent attitude structures than nonusers. On the basis of the particular bands which revealed consistency differences, recommendations were made concerning the type of materials that should be included in persuasive appeals directed toward the potentially changeable nonusers.—*Journal abstract.*

ATTITUDES & OPINIONS

2255. **Alutto, Joseph A. (State U. New York, Buffalo) Some dynamics of questionnaire completion and return among professional and managerial personnel: The relative impacts of reception at work site or place of residence.** *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 430-432.—Survey results from 700 male Ss indicate that overall response and completion rates for closed-ended questions were independent of whether questionnaires were mailed to an S's place of residence or work site. However, receipt of the survey instrument at home or on the job did affect completion rates for open-ended questions. It is suggested that mailed surveys designed to include middle-class males employed in professional or managerial occupations might receive higher completion rates for open-ended questionnaire items when contact with Ss occurs at place of work rather than residence.—*Journal abstract.*

2256. **Berger, Philip K. & Sullivan, James E. (U. Kentucky) Instructional set, interview context, and the incidence of "don't know" responses.** *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 414-416.—Examined a hypothesis formulated by E. J. Webb, D. T. Campbell, R. D. Schwartz, and L. Sechrest (see PA, Vol. 40:6543) that instructions emphasizing a respond-

ent's importance to an attitude survey would result in a reduced number of "don't know" responses to the items. A 20-item questionnaire was administered to 180 undergraduates under 3 contexts: face-to-face interviews, telephone interviews, and group administration. Contrary to the hypothesis, in both the telephone and group administration contexts, there were significantly more "don't knows" under the instructions emphasizing the respondents' importance than with the control instructions. There was no difference between instructional sets in the face-to-face context. Results are discussed in terms of the social environments within which the questionnaires were administered.—*Journal abstract*.

2258. Diamond, Paul L. (U. Texas) **Order effects in judgments of conflicting information as a function of cognitive complexity and relevance of information.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5673.

2259. Fürntratt, Ernst & Gutsche, Hans J. (U. Giessen, Psychologische Inst., W. Germany) **Untersuchungen zum Image der Psychologie in Deutschland: I. Die Stellung der wissenschaftlichen Psychologie zu anderen Fachgebieten in der Vorstellung von Oberschülern.** [Investigations concerning the image of psychology in Germany: I. The position of scientific psychology as compared with other scientific disciplines as conceptualized by high school students.] *Psychologische Beiträge*, 1969, Vol. 11(3), 368-389.—The views of high school students regarding psychology and 14 other scientific disciplines were analyzed by means of 1 and multidimensional scales. Results indicate that psychology is viewed as "the very" science of man as an individual, it is also viewed as being more related to nature than to culture, neither directly related to public opinion nor adverse to it, and more transcendently oriented than reality oriented. (French summary)—*English summary*.

2260. Hammer, Max. (U. Maine) **Preference for a male child: Cultural factor.** *Journal of Individual Psychology*, 1970(May), Vol. 26(1), 54-56.—504 childless adults of both sexes, married and unmarried, attending college and not in college, were asked their preference about the sex of a child if they could have only 1 offspring. College students heavily preferred boys. In the noncollege group, preference followed the sex of the respondent. Results are viewed as supporting Adlerian rather than Freudian views.—A. R. Howard.

2261. Heinerth, Klaus. (U. Tübingen, Psychologische Inst., W. Germany) **Verbales und nicht-verbales diskriminierendes Verhalten Deutscher gegenüber Ausländern.** [Verbal and non-verbal discriminating behavior of Germans toward foreigners.] *Psychologische Beiträge*, 1969, Vol. 11(3), 323-327.—Observable discriminating behavior correlates with certain formal indicators that can be derived from the individual stereotype: (a) the frequency of negative traits that are attributed to an ethnic group ($r = +.482$), and (b) the frequency of traits that are neither significantly ascribed to a nation nor denied a nation ($r = +.389$). To reach a precise prediction of prejudice both criteria can be combined. Ss that are prejudiced, judge by using negative traits that are unspecifically attributed to other

nations ($r = +.558$). (French summary)—*English summary*.

2262. Rabushka, Alvin. (U. Rochester) **Affective, cognitive, and behavioral consistency of Chinese-Malay interracial attitudes.** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 35-41.—Analysis of a random sample of Chinese and Malay residents in George Town (Penang), Malaysia, provided an opportunity to estimate empirically the relationships between the major components of attitudes— affective, cognitive, and behavioral. Data reveal that affect and behavior are positively correlated, but that behavior and cognition along with affect and cognition do not appear in a consistent arrangement. These findings vary from the results of recent experimental inquiries which have shown that attitude components appear in a consistent arrangement. The difference in results may be explained by use of survey research techniques among a relatively uneducated mass of urban residents in an underdeveloped country, rather than relying on college students as experimental Ss.—*Author abstract*.

2263. Ramsay, J. O. & Case, B. (McGill U., Montreal, Quebec, Canada) **Attitude measurement and the linear model.** *Psychological Bulletin*, 1970(Sep), Vol. 74(3), 185-192.—A model proposed by M. Fishbein and L. R. Tucker for attitude is identical to the linear model in statistical inference. In this model, the evaluative reaction to a stimulus is a consequence of summing the product of the evaluative reaction to a relevant property and the stimulus scale value on that property across all relevant properties. If the scale values of the stimuli on the relevant properties are known, then a multiple regression of the stimulus evaluations on the property scale values will provide estimates of the evaluative reactions to the properties. An experiment is described in which 26 undergraduates' attitudes toward countries are analyzed using the model. It is concluded that the model fits the data well and allows several interesting statements to be made about the cognitive and evaluative components of these attitudes.—*Journal abstract*.

2264. Verinis, J. S. & Roll, S. (Mt. Sinai Hosp., Chicago, Ill.) **Primary and secondary male characteristics: The hairiness and large penis stereotypes.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 123-126.—Showed 36 male and 24 female undergraduates slides of a hairy arm, an arm without hair, a hairy chest, a chest without hair, a large penis and a small penis. Ss rated the slides on various adjective scales. The hairy arm and hairy chest were rated as more potent and more active than their hairless counterparts and the large penis was rated as more potent than the small penis. Results were replicated for a smaller group ($N = 37$).—*Journal abstract*.

Formation & Change

2265. Alms, Alan C. (Ed.) (U. California, Davis) **Role playing, reward, and attitude change: An enduring problem in psychology.** New York, N.Y.: Van Nostrand Reinhold, 1969. vi, 232 p. \$2.50(paper).—Presents summaries and reprints of the essential research papers of Leon Festinger, Milton J. Rosenberg, Daryl J. Bem, and others, dealing with the effects of role playing on attitude change. The selections include attitude topics and demonstrate the controversy between dissonance theory, incentive-conflict theory, and other views from the inception of role playing research to the present.

2266. **Brilhart, Barbara L.** (U. Nebraska) **Relationships of speaker-message perception to perceptual field-independence.** *Journal of Communication*, 1970(Jun), Vol. 20(2), 153-166.—Studied speaker-message perception and attitude change occurring under varying conditions of speaker and message quality, as related to perceptual field-independence defined by performance on the Embedded Figures Test. Ss were male engineering students. Results indicate that perceptual orientation was significantly related to relative focus on speaker or message quality. The hypothesis on attitude change in relation to perceptual orientation was not supported.—*P. Federman.*

2267. **Cooper, Joel & Worchel, Stephen.** (Princeton U.) **Role of undesired consequences in arousing cognitive dissonance.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 199-206.—Tested the proposition that counterattitudinal advocacy does not lead to the arousal of cognitive dissonance unless that advocacy results in undesirable consequences. 56 male undergraduates performed an extremely dull task. They then were offered varying incentives to tell a waiting S that the dull task was interesting and enjoyable. $\frac{1}{2}$ of the Ss learned that they had succeeded in convincing their supposedly naive, unsuspecting colleague that the task would be interesting. The other $\frac{1}{2}$ learned that their colleague still believed that the task would be dull. All Ss then evaluated the task. Results support the prediction that only those Ss who thought they had brought about the undesirable consequence of convincing the waiting S that the task was interesting would demonstrate the dissonance-produced, inverse relationship between incentive magnitude and attitude change. Implications of findings for some of the recent revisions of dissonance theory are discussed. (18 ref.)—*Journal abstract.*

2268. **Greenwald, Anthony G.** (Ohio State U.) **When does role playing produce attitude change? Toward an answer.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 214-219.—Counterattitudinal role playing (writing an essay opposing one's attitudes) was not effective in producing attitude change when 209 undergraduates were provided an opportunity to consider and reject role-supporting arguments prior to their role assignment. In contrast, the role-playing effect was obtained when the same role-supporting information was not initially examined until after role assignment. Results are interpreted in terms of an associative model of persuasion, and it is concluded that attitude change through role playing may depend on the role player's having an opportunity to consider counterattitudinal information that he has not previously rejected.—*Journal abstract.*

2269. **Johnson, Homer H.** (Loyola U., Chicago, Ill.) **A methodological note on initial scale position and primacy-recency effects.** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 113-134.—Ss responded to an attitude questionnaire, 1 item which assessed their attitudes on "Is the protective tariff a wise policy for the United States. Because of the methodology used, 202 undergraduates with extreme initial attitude positions tended toward recency effects in traditional primacy-recency attitude change research. Since the presence of extreme scoring Ss will tend to bias the results in a recency direction, it is suggested that the Ss' initial scale position be taken into account in the data analysis.—*Author abstract.*

2270. **Marcus, Alan M.** (U. Toronto, Ontario, Canada) **Audience variables in persuasion.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5525-5526.

2271. **Myers, Michele T. & Goldberg, Alvin A.** (Monticello Coll.) **Group credibility and opinion change.** *Journal of Communication*, 1970(Jun), Vol. 20(2), 174-179.—Studied the effect of messages of varying ethos on opinion change. The results support the hypothesis that messages attributed to a high ethos group are more influential than those attributed to a collection of high ethos individuals, a collection of low ethos individuals, a high ethos individual, and low ethos group.—*P. Federman.*

2272. **Page, Monte M.** (U. Nebraska) **Role of demand awareness in the communicator credibility effect.** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 57-66.—Ss participated in a laboratory opinion change experiment with credibility of the communicator manipulated. Then they were given an extended postexperimental questionnaire assessing awareness of demand characteristics. Ss judged aware of the experimenter's hypothesis behaved differently than those judged unaware. In the low credibility condition Ss who believed change was not expected did not change; while those who had not come to this conclusion changed. In the high credibility condition most Ss were aware that change was expected and they changed dramatically more than unawares. Results are interpreted as suggesting that, in general, demand characteristics and persuasion are confounded in laboratory opinion experiments, but the results of manipulations like communicator credibility may be entirely due to the demand characteristics of the situation.—*Author abstract.*

2273. **Rhine, Ramon J. & Severance, Laurence J.** (U. California, Riverside) **Ego-involvement, discrepancy, source credibility, and attitude change.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 175-190.—Gave persuasive messages to 144 undergraduates in a 3-factor design having 3 levels of discrepancy, 2 levels of source credibility, and 2 levels of ego-involvement. Dependent measures were attitude change, source credibility change, ego-involvement change, changes in latitudes of acceptance and rejection, and message evaluation. More attitude change occurred for low than for high ego-involvement. Attitude change was an increasing monotonic function of discrepancy for low ego-involvement, and a nonmonotonic function of discrepancy for high ego-involvement. After receipt of the persuasive message, low credible sources increased in authoritativeness and the importance of the low-ego-involvement issue increased. A number of findings, significant beyond the .01 or .001 levels, were opposed to dissonance theory predictions. Most of the data are consistent with social judgment theory. (22 ref.)—*Journal abstract.*

2274. **Winett, Richard A.** (State U. New York, Stony Brook) **Attribution of attitude and behavior change and its relevance to behavior therapy.** *Psychological Record*, 1970(Win), Vol. 20(1), 17-32.—Supports the position that greater attitude and behavior change results when an individual attributes changes in his behavior to himself rather than to external manipulations. Research derived from the S. Schacter and J. E. Singer emotionality model, L. Festinger's theory of cognitive dissonance, and role-playing studies supports this perspective. The implications of this research in terms of the practice

and scope of behavior therapy, are also discussed. (92 ref.)—*Journal abstract.*

2275. **Zimbardo, Philip G. & Ebbesen, Ebbe B.** (Stanford U.) **Experimental modification of the relationship between effort, attitude, and behavior.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 207-213.—Manipulated the effort of role playing a dissonant, persuasive speech through the use of delayed auditory feedback, and observed the effects on attitudes and compliance. In Exp. I with 63 male undergraduates, a within-S design was employed as each S read speeches under 3 different auditory feedback conditions: normal, white noise, and Ss own voice heard at a .2-sec delay. Self-report scales were used to assess attitude change, as well as learning the communication and effort in delivering it. Exp. II with 23 Ss also utilized delayed auditory feedback to manipulate role-playing effort, while assessing its effect on a more behavioral measure (amount of compliance to a dissonant request). Both self-report and "behavioroid" measures indicate the greater effectiveness of effortful role playing. The possibility that greater effort expended in role playing acts directly to influence effortful compliance—regardless of the relevance of the attitude positions involved—is entertained.—*Journal abstract.*

Influence & Behavior

2276. **Brigham, John C. & Cook, Stuart W.** (U. Colorado) **The influence of attitude on judgments of plausibility: A replication and extension.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 283-292.—3 groups of college students presumed to differ with respect to attitudes towards Negroes rated groups of items for plausibility. Items dealt with gradual vs. rapid integration, government intervention vs. local autonomy, private rights, and racial intermarriage. Ss rated the items on a 6-point scale from -3, very ineffective, to +3, very effective. The order of the mean plausibility ratings for the 3 groups were (a) civil rights group, (b) race relations class, and (c) exclusionist social groups. Differences between the groups were highly significant. Plausibility ratings were correlated with group extremeness, median eta being .57.—*N. M. Chansky.*

2277. **Eisenman, Russell.** (Temple U.) **Teaching about the authoritarian personality: Effects on moral judgment.** *Psychological Record*, 1970(Win), Vol. 20(1), 33-40.—To test the effectiveness of teaching in modifying moral judgments, 200 undergraduates were administered a test of moral judgments in mitigating circumstances. 2 of the 5 classes received instruction about the authoritarian personality, while 3 classes served as controls and received no such information. In a pretest-posttest design, with effects of pretesting statistically analyzed, it was found that Ss who were taught about the authoritarian personality made significantly less severe moral judgments ($p's < .001$). In addition, females were more moralistic than males, and 1st-born females were more moralistic than later-born women. Results suggest that moral judgments can be manipulated to be less severe. (25 ref.)—*Journal abstract.*

2278. **Erb, David L.** (Michigan State U.) **Racial attitudes and empathy: A Guttman facet theory examination of their relationships and determinants.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5234.

2279. **Evans, Richard L., et al.** (U. Houston) **Fear**

arousal, persuasion, and actual versus implied behavioral change: New perspective utilizing a real-life dental hygiene program. *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 220-227.—Exposed 394 12-15 yr. old Ss to high and moderate fear arousal, positive affect arousal, elaborated recommendations only, and brief recommendations only directed at improving toothbrushing behavior. Criterion measures of information, anxiety, intention to behave, self-report of behavior, and a new chemical indicator of actual toothbrushing behavior were administered precommunication, immediately postcommunication, 5-days postcommunication, and 6-wk postcommunication. Results suggest that elaborated recommendations and positive affect were most effective in changing actual behavior, but that high fear and recommendations only were the most effective in changing reported behavior. Effects of all conditions were attenuated over time.—*Journal abstract.*

2280. **Hendrick, Clyde & Shaffer, David R.** (Kent State U.) **Effects of arousal and credibility on learning and persuasion.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 241-243.—Explored the joint effects of extraneous arousal and communicator credibility on acceptance and learning of a persuasive communication. 80 undergraduates listened to a taped speech under either average volume (low arousal) or very high volume (high arousal). The speaker was either high or low in credibility. Males and females reacted very differently to the situation. Females were more persuaded under low arousal than under high arousal, but there were no differences for males. Credibility had no effect. An unusual learning effect emerged. There was a Credibility \times Arousal interaction that had the same form for both sexes. Attitude results are given a dissonance interpretation.—*Journal abstract.*

2281. **Hoffman, D. T., Schackner, R., & Goldblatt, R.** (U. Bridgeport) **"Friendliness" of the experimenter.** *Psychological Record*, 1970(Win), Vol. 20(1), 41-44.—26 male and 34 female undergraduates were treated either in a friendly or neutral manner by an E during an initial, instructional phase of the experimental session. Significant differences in the groups were found in (a) the proportion of photographs of facial expression assigned to the love-mirth-happiness category, and (b) affective reaction to the experimental situation as measured by a postsession questionnaire and adjective checklist. No significant sex differences in adjective checklist responses were observed.—*Journal abstract.*

2282. **Storms, Michael D. & Nisbett, Richard E.** (Yale U.) **Insomnia and the attribution process.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 319-328.—Gave 42 19-26 yr. old insomniac Ss placebo pills to take a few min. before going to bed. Some Ss were told that the pills would cause arousal (arousal condition), and others were told that the pills would reduce arousal (relaxation condition). As predicted, arousal Ss got to sleep more quickly than they had on nights without the pills, presumably because they attributed their arousal to the pills rather than to their emotions, and as a consequence were less emotional. Also as predicted, relaxation Ss got to sleep less quickly than usual, presumably because they assumed that their emotions were unusually intense since their arousal level was high even after taking an arousal-reducing agent. Results have relevance for S. Schachter's theory of emotions and H. Kelley's attribution theory. Prag-

matically, findings suggest the feasibility of a therapy based on reattribution of symptoms, and indicate that traditional suggestion effect practices should be modified.—*Journal abstract.*

GROUP & INTERPERSONAL PROCESSES

2283. Aronoff, J. (Michigan State U.) **Psychological needs as a determinant in the formation of economic structures: A confirmation.** *Human Relations*, 1970(Apr), Vol. 23(2), 123-138.—Studied the interaction of personality and social structure in cane gangs in St. Kitts in the British West Indies. Evolution of the gangs from a traditional configuration under a "head-cutter" through a broken-gang configuration to more democratic individually oriented structure in the course of several yr. is traced. Changes in structure are related to changes in the psychological configuration of the cutters. Earlier groups had experienced greater degrees of loss and less stable family situations. The level of functioning was also influenced by improved medical standards and changed emigration rates.—*W. W. Meissner.*

2284. Blakeney, Roger N. (U. Houston) **An experimental study of the effects of the temporal placement of unfavorable information during the selection interview.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5729-5730.

2285. Byrne, Donn; Ervin, Charles R., & Lamberth, John. (Purdue U.) **Continuity between the experimental study of attraction and real-life computer dating.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 157-165.—Conducted a computer dating field study as a test of the nonlaboratory generalizability of attraction research. A 50-item questionnaire of attitudes and personality was administered to 420 undergraduates, and 44 male-female pairs were selected on the basis of maximal or minimal similarity of responses. Each couple was introduced, given differential information about the basis for their matching, and asked to spend 30 min. together on a "coke date." Afterward, they returned to the E and were independently assessed on a series of measures. It was found that attraction was significantly related to similarity and to physical attractiveness. Physical attractiveness was also significantly related to ratings of desirability as a date, as a spouse, and to sexual attractiveness. Both similarity and attractiveness were related to the physical proximity of the 2 individuals while they were talking to the E after the date. In a follow-up investigation at the end of the semester, similarity and physical attractiveness were found to predict accurate memory of the date's name, incidence of talking to one another in the interim since the coke date, and desire to date the other person in the future. (26 ref.)—*Journal abstract.*

2286. Cannavale, F. J., Scarr, H. A., & Pepitone, A. (U. Pennsylvania) **Deindividuation in the small group: Further evidence.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 141-147.—Replicated and extended L. Festinger, A. Pepitone, and T. Newcomb's (see PA, Vol. 27:2609) study of deindividuation in small discussion groups, which showed that groups whose members were relatively unable to identify who had made certain statements in the discussion (deindividuation) were those in which a relatively large amount of hostile feelings and sentiments were expressed (reduction in restraint), and that those groups which overcame most restraint were found to be most attractive

to the members. A 3rd finding of relevance to the hoary concept of the group mind was that the correlation between deindividuation and the reduction in restraint held only when the group was used as the unit of analysis. A replication using 72 undergraduate and graduate students in groups of males, females, and both males and females, confirmed the positive correlation between deindividuation and restraint reduction, which is significant only when the group is used as the unit of analysis. The failure of reduction in restraint to be correlated with group attraction and the role of preexisting discussion apprehension in not-all-male groups are discussed, along with a general theoretical analysis of the deindividuation phenomenon.—*Journal abstract.*

2287. Carkhuff, Robert R. & Banks, George. (American International Coll., Center for Human Relations & Community Affairs) **Training as a preferred mode of facilitating relations between races and generations.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 413-418.—14 white teachers and 10 black parents, divided into 2 groups of 7 whites and 5 blacks each, received systematic training in interpersonal skills from a black trainer and a white trainer in counterbalanced order. Significant gains were demonstrated in communication and discrimination on standard helpee stimulus expressions and standard racial problems and in functioning in the helping role with both white and black adults and white and black children. Implications for systematic training in human relations problem areas are considered.—*Journal abstract.*

2288. Cvetkovich, George T. (Kansas State U.) **Judgment processes in small groups: A longitudinal study of learning, conflict and compromise.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5708.

2289. Des Jarlais, Don. (U. Michigan) **Shifts to risk and reward.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 119-122.—Investigated the expected payoffs for the risky alternatives in a standard shift-to-risk experiment with 65 undergraduates. As predicted, a significant shift to reward was found. The group expectations of the risky payoffs were higher than the means of the individual expectations. The shift to reward was significantly correlated with a contemporaneous shift to risk. Implications of the shift to reward are discussed.—*Journal abstract.*

2291. Efran, Michael G. (U. Texas) **Visual interaction and interpersonal attraction.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5522.

2292. Fortune, Hilda O. (York Coll., City U. New York) **The pros and cons of sensitivity training.** *Nursing Outlook*, 1970(Jun), Vol. 18(6), 24-29.—Emphasizes consideration of all aspects of current problems concerning sensitivity training. The issue of who should participate in sensitivity sessions is analyzed with respect to the distinction between sensitivity sessions which focus on the learning process in normal individuals, and therapy sessions which focus upon the therapeutic process in patients. Various techniques used by trainers are discussed in terms of their purpose and effectiveness. It is suggested that such techniques be used for freedom-giving, rather than manipulative purposes. Beneficial and detrimental aspects of current attempts to

establish certification and licensing requirements are discussed in relation to trainer functions. The controversy over social consciousness and social action as appropriate objectives vs. the established objective of self-enhancement is also considered. It is concluded that an interdisciplinary approach might best contribute to the solution of current problems. (18 ref.)—*R. Wiltz.*

2294. Kershenbaum, Brenda R. & Komorita, S. S. (Wayne State U.) **Temptation to defect in the Prisoner's Dilemma game.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 110-113.—Cooperation in the Prisoner's Dilemma (PD) game has been shown to be inversely related to the magnitude of temptation to defect. In order to determine the relative effects of self-temptation (maximize personal gain) vs. suspicion that the other is tempted, temptation for self and other were each varied in 2 ways (high vs. low). Unlike a regular PD game, 96 undergraduates were given a cooperative orientation and presented 2 PD games simultaneously such that feedback regarding the other's choice was uncertain. None of the main effects was significant, but a significant interaction between self and other's temptation was obtained; when temptations were equal, trust and cooperation were maintained longer than when they were unequal. Results are interpreted in terms of inequity in the structure of the game.—*Journal abstract.*

2295. Lange, Silvia. (Community Mental Health Services Day Center, San Diego, Calif.) **Esalen—and afterward.** *Nursing Outlook*, 1970(Jun), Vol. 18(6), 33-35.—Describes an experience in and the resulting effects of a weekend seminar and subsequent week-long workshop at Esalen Institute in Big Sur, California. Sessions focused on W. C. Schutz' theory of interpersonal needs of inclusion, control, and affection, which were demonstrated through various encounter-group techniques. Other techniques and approaches designed to facilitate self-understanding are discussed. The effects of the experience are discussed in terms of T. A. Harris' transactional theory. It is concluded that the experience resulted in increased skill as a psychotherapist, increased effectiveness as a teacher, and greater productivity as a writer.—*R. Wiltz.*

2296. Lebra, Takie S. (U. Hawaii) **Reciprocity and the asymmetric principle: An analytical reappraisal of the Japanese concept of On.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 129-138.—Reciprocity as a frame of reference for explaining social phenomena has been well demonstrated in anthropology and sociology. It was hypothesized that 2 types of social transaction, reciprocal and asymmetric, tend to generate and constrain each other. The hypothesis was applied to the Japanese concept of On, a moral doctrine which stresses an asymmetric principle. Assumed is the existence of implicit mechanisms allowing reciprocity to operate also and 6 such mechanisms are identified. (33 ref.)—*R. D. Nance.*

2297. Merrick, Richard & Taylor, Stuart P. (Kent State U.) **Aggression as a function of vulnerability to attack.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 203-204.—30 high-need achieving and 30 low-need achieving male undergraduates competed in a task

involving RT with opponents who attempted to give them increasing shocks. Counteraggression varied as a function of the degree to which S was vulnerable to the opponent's attack. All conditions of vulnerability evidenced an increase in counteraggression. However, the equal-vulnerability condition evidenced the greatest increase in aggression. Achievement motivation had little effect on aggression.—*Journal abstract.*

2298. Merton, Robert K. (Columbia U.) **The social nature of leadership.** *American Journal of Nursing*, 1969(Dec), Vol. 69(12), 2614-2618.—Emphasizes the basic distinctions between leadership and authority. "Authority involves the legitimated rights of a position that requires others to obey; leadership is an interpersonal relation in which others comply because they want to, not because they have to." There is no evidence to support the theory that there are any specific traits linked with leadership. Instead, leadership involves transactions between the leader and the followers.—*B. A. Stanton.*

2299. Moss, Martin K. (Kansas State U.) **Social desirability, physical attractiveness, and social choice.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5678.

2300. Oskamp, Stuart & Kleinke, Chris. (Claremont Graduate School, Calif.) **Amount of reward as a variable in the Prisoner's Dilemma game.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 133-140.—Conducted 2 experiments to test the effect of reward level on cooperation in the Prisoner's Dilemma (PD) game. 136 high school students who produced the usual low levels of cooperation (30-40%) served as Ss. Exp. I found no differences in the effects of 5 different reward levels. Exp. II showed that no reward (working for points) produced slightly, but nonsignificantly, more cooperation than either a low- or a high-reward level. It is concluded that the PD game has a different motive structure inherent in its payoff matrix than the Maximizing Difference game or Deutsch's trucking game. These results plus a review of other PD studies show that cooperation in the PD game is little affected by the amount of reward, adding credence to the results of PD studies which have used low or imaginary rewards. (15 ref.)—*Journal abstract.*

2301. Pellegrini, Robert J. & Empey, John. (San Jose State Coll.) **Interpersonal spatial orientation in dyads.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 67-70.—30 male and 30 female undergraduates described themselves to a same-sex listener (L) in an interview-like situation. The distance and angle at which S placed his own chair relative to L's were measured. Although females sat significantly closer to the female L than did males to the male L, displacement away from a direct, face-to-face orientation with L was also significantly greater for females than for males. Significant negative correlations were obtained between the measures of proximity and angle of regard for both males ($r = -.45$, $p < .02$) and females ($r = -.39$, $p < .05$). Results are discussed in terms of M. Argyle and J. Dean's theory of interpersonal behavior.—*Journal summary.*

2302. Rubin, Zick. (Harvard U.) **Measurement of romantic love.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 265-273.—Reports initial results of an attempt to introduce and validate a social-psychological construct of romantic love. Starting with the assumption that love is an interpersonal attitude, an internally consistent paper-and-pencil love scale was developed. The conception of romantic love

included 3 components: affiliative and dependent need, a predisposition to help, and an orientation of exclusiveness and absorption. The 13-item love-scale scores were only moderately correlated with scores on a parallel 13-item scale of "liking," which reflected a more traditional conception of interpersonal attraction. The validity of the love scale was assessed in a questionnaire study with 158 undergraduate dating couples and a laboratory experiment with 79 undergraduate dating couples. On the basis of the emerging conception of love, it was predicted that college dating couples who loved each other a great deal (as categorized by their love-scale scores) would spend more time gazing into one another's eyes than would couples who loved each other to a lesser degree. The prediction was confirmed. (22 ref.)—*Journal abstract*.

2303. Schwartz, Shalom H. & Clausen, Geraldine T. (U. Wisconsin) **Responsibility, norms, and helping in an emergency.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 299-310.—Replicated the J. Darley and B. Latané (see PA, Vol. 42:8862) study of bystander aid to a seizure victim examining the effects of (a) number and competence of bystanders, (b) information appropriate for action, and (c) ascription of responsibility (AR) upon helping by males and females. From an analysis of norms relevant in an emergency and of the likelihood of their activation, main effects on speed of helping for the above 4 variables, interactions of the 1st 3 with AR, a Sex of Subject \times Number interaction, and differences in type of help offered in various conditions were predicted. 179 undergraduates participated in a factorial experiment. Speed of helping dropped significantly for females, but not for males, when other bystanders were present (reporting decreased, direct help was unaffected), and dropped significantly further when another bystander was medically competent (reporting increased, direct help decreased). Among females disposed to accept rationales for denying responsibility, both effects were particularly strong. Information-action and AR to the self were associated with faster and more direct help. Data on Ss' thoughts and feelings reinforced a normative interpretation of the results.—*Journal abstract*.

2304. Sermat, Vello. (York U., Toronto, Ontario, Canada) **Is game behavior related to behavior in other interpersonal situations?** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 92-109.—4 experiments with a total of 42 male and 48 female undergraduates and 48 female high school students, investigated the consistency of cooperative or competitive behavior of Ss in 2 different experimental situations. Ss who had behaved either extremely competitively or extremely cooperatively in a Game of Chicken or a Prisoner's Dilemma game were tested in 1 of 2 conditions: (a) a mixed-motive task where payoff was obtained through a series of steps which the other player could block (the Paddle Game), or (b) a picture-interpretation task involving story writing and discussion in dyads. In the Paddle Game, most Ss cooperated, but previous high competitors waited less often for their turn, were usually paid 1st, and in 1 experiment, earned more money. In the picture-interpretation task, few behavioral differences were found between cooperators and competitors, but pairs of competitors were in greater agreement in their story interpretations and portrayed more cynicism about interpersonal relationships than did others. Female cooperator pairs showed high agreement

and low cynicism. This suggests that competitors may share certain views, different from cooperators, about interpersonal relationships. However, the findings do not justify broad generalizations from behavior in experimental games to other interpersonal situations. (26 ref.)—*Journal abstract*.

2305. Seven, Sally A. (Claremont Graduate School, Calif.) **The effects of network pattern and network size on individual solutions of communication networks.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5724-5725.

2306. Smith, C. G. (U. Notre Dame) **Age of R and D groups: A reconsideration.** *Human Relations*, 1970(Apr), Vol. 23(2), 81-96.—Studies 52 scientific research groups and confirms a curvilinear relationship between group performance and group age. Group performance, as measured by staff evaluations of general technical contributions and general usefulness and self-reports of number of patents and published technical papers, tended to peak at about 3 yr. Performance in respect to actual scientific products—patents and technical papers—showed a gradual increment with age of the group. The group undergoes social changes which result in qualitatively different types of group performance at different stages of group development.—*W. W. Meissner*.

2307. Stultz, I. B. (University Coll., London, England) **The role of static pedestrian groups in crowded spaces.** *Ergonomics*, 1969(Nov), Vol. 12(6), 821-839.—Hypothesized that groups of static pedestrians would play an important role in determining patterns of movement in crowded spaces. This was investigated in 5 ticket halls. Queues, groups of people using automatic ticket machines, and other types of static groups were observed. The location of these groups was related to the layout of the space, and their general effects on movement through the space were assessed. It was found that under certain conditions static groups impede movement and diminish the effective width of key movement channels. Results suggest a number of ways in which the layout of certain types of space might be optimized in terms of the criteria considered. (German & French summaries)—*Journal abstract*.

2308. Swingle, Paul G. (McMaster U., Hamilton, Ontario, Canada) **Exploitative behavior in non-zero-sum games.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 121-132.—Conducted 5 experiments to test the hypothesis that nonuse, and under certain conditions, decreasing use, of power invites exploitation. 76 naval recruits and 60 male undergraduates served as Ss. In non-zero-sum games, virtually unconditionally cooperative opponents were exploited more when they were powerful than when they were weak. Such behavior was not affected by decreasing the payoff received for an exploitative response. Although Ss had a tendency to exploit weak opponents in ethnically heterogeneous dyads, further studies indicate that the principal factor affecting the tendency to exploit a powerful opponent was the latter's unconditional nonuse or decrease in the use of his punishing capability.—*Journal abstract*.

2309. Wichman, Harvey. (California State Coll., San Bernardino) **Effects of isolation and communication on cooperation in a two-person game.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 114-120.—Created 4 conditions of communication in a Prisoner's Dilemma (PD) game: (a) Ss were isolated so

that they could neither see nor hear each other, as in the typical PD experiment; (b) Ss could see but not hear each other; (c) Ss could hear but not see each other; and (d) Ss could both hear and see each other. Results from 48 female undergraduates show an increasing amount of cooperation through all 4 conditions, especially when Ss could see each other. It is concluded that the high degree of competitiveness typically found in PD game studies may be largely a function of the isolation imposed on the Ss by the E. (21 ref.)—*Journal abstract*.

2311. Wyatt, Wendy C. (Boston U.) **Responsible use of sensitivity training.** *Nursing Outlook*, 1970(Jun), Vol. 18(6), 39-40.—Suggests that the success of a human relations program can be facilitated if the following precautions regarding the sensitivity training experience are taken into consideration: (a) clarification of the new vocabulary related to sensitivity training; (b) clear and specific expression of goals and purposes; (c) translation of such goals into a workshop design in which the various exercises and techniques are carefully selected; (d) careful selection of the training staff on the basis of possession of a background and experience related to participant needs; and (e) screening of participants, informing them as fully as possible, and leaving them the choice to participate.—*R. Wiltz*.

2312. Yeaworth, Rosalee. (U. Cincinnati) **Learning through group experience.** *Nursing Outlook*, 1970(Jun), Vol. 18(6), 29-32.—Describes the functions and features of sensitivity training (T) groups, emphasizing the implications for nursing. It is suggested that T groups provide learning through the experience of involved participants on the basis of 2 main features: (a) the lack of structure which provides participants with the opportunity to observe firsthand the development of a group, and (b) feedback which facilitates increased self-understanding. An analogy is drawn between T-group processes and the sociological concept of collective behavior. Various features of the T-group experience, particularly the sense of isolation and loss of support for routines, are suggested to have significance for nurses in their relationship with patients. It is concluded that the unfortunate experiences often attributed to T groups by the popular press can be avoided by carefully selecting the group in accordance with specifications of the National Training Laboratories and the American Psychological Association. (21 ref.)—*R. Wiltz*.

2313. Zneimer, Edward J. (Washington U.) **Conformist, anticonformist and independent responses to reciprocity demands.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5705.

Influence & Communication

2314. Akutsu, Yoshihiro. (Michigan State U.) **Commitment, self-evaluation and communication activity in a dissonant situation: A study of foreign students with English language deficiency.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5520-5521.

2315. Argyle, Michael, et al. (Oxford U., Inst. of Experimental Psychology, England) **The communica-**

tion of inferior and superior attitudes by verbal and non-verbal signals. *British Journal of Social & Clinical Psychology*, 1970(Sep), Vol. 9(3), 222-231.—120 students rated 18 videotapes in which verbal and nonverbal cues for inferior, equal, and superior were varied and combined in a 3 x 3 design. The typed messages (verbal alone) were rated by further Ss, as were videotapes of a performer reading numbers (nonverbal alone); the 2 sets of cues alone had identical effects on ratings. In combination, both kinds of cue had a reduced effect, but nonverbal cues had 4.3 times the effect of verbal cues on shifts of ratings, and accounted for 10.3 times as most variance. Verbal cues were only able to act as multipliers of consistent nonverbal cues. There was little evidence of double-bind effects. Analysis of individual differences shows that females were relatively more responsive to nonverbal compared with verbal cues, and that more neurotic Ss found the combination of superior (nonverbal) with inferior (verbal) unpleasant, and responded more to verbal cues for inferior-superior. (18 ref.)—*Journal abstract*.

2316. Cull, John. (Virginia Commonwealth U., Richmond) **Age as a factor in achieving conformity.** *Industrial Gerontology*, 1970(Spr), Vol. 5, 28-34.—Tests the hypothesis that conformity behavior is not related to the age of confederates. 16 young male Ss individually participated in a group conformity experiment in which 4 young confederates of E were primed to verbalize 12 incorrect answers in a series of 18 simple matching-to-sample problems involving line length. Each S verbalized his answer after he had heard the answers of each of the confederates. A 2nd group of 16 similar Ss participated in a similar procedure, with the exception that the confederates were 60-yr-old or older. The 2 groups were not found to differ significantly in conformity behavior as measured by number of conforming responses or number of conforming responses plus error responses; however Ss with old confederates made significantly more error responses than Ss with young confederates. It is concluded that "elderly confederates fail to exert more conforming pressure than younger confederates."—*R. Wiltz*.

2317. Graham, William K. & Harris, Stephen G. (U. California, Berkeley) **Effects of group discussion on accepting risk and on advising others to be risky.** *Psychological Record*, 1970(Spr), Vol. 20(2), 219-224.—Examined risk following group discussion by administering the usual advisory decision-making form of the N. Kogan and M. A. Wallach (see PA, Vol. 39-6826) Choice Dilemmas Questionnaire and a Risk Acceptance form which asked that the S imagine himself as the central decision-maker in each decision situation. 16 groups discussed 5 problems; however, pre- and post-discussion risk levels were assessed for 10 problems. Analysis of covariance demonstrated a significantly greater increase in risk following discussion for groups in the risk acceptance condition ($p < .01$). Ss in the latter condition also showed greater variability in amount of shift than did Ss in the advisory condition ($p < .01$). Results support R. Brown's value of risk theory.—*Journal abstract*.

2318. Klipnis, David & Goodstadt, Barry. (Temple U.) **Character structure and friendship relations.** *British Journal of Social & Clinical Psychology*, 1970(Sep), Vol. 9(3), 201-211.—Studied friendship relations in terms of interpersonal influence, self-disclosure and extent of social activities among 30 impulsive and nonimpulsive

undergraduates. The procedure involved having Ss bring a friend into the laboratory. Questionnaire and autokinetic studies of mutual influence reveal that impulsive Ss were less influenced by friends' judgments, dominated their good friends more, socialized more, and disclosed more intimate information about themselves than non-impulsive Ss. In a 2nd study with 32 Ss, it was found that the judgments of a male stranger had no influence on impulsive Ss' judgments, while those of a female stranger did. Both male and female strangers influenced the judgments of nonimpulsive Ss. Other findings indicate that friends resembled Ss in terms of impulsivity test scores. Findings are discussed in terms of the functional value of friendship for persons varying in impulsivity. (19 ref.)—*Journal abstract.*

2319. London, H., Meldman, P. J., & Lanckton, A. V. (Brandeis U.) **The jury method: Some correlates of persuading.** *Human Relations*, 1970(Apr), Vol. 23(2), 115-121.—32 undergraduates were presented fact summaries, judge's instructions, and legal analyses of the case in a simulated 2-man jury situation. Change of certainty of persuaders was evaluated. Results show that persuaders changed their degree of certainty less than persuadees, and that persuaders were more certain of the final common opinion than were persuadees. The finding that persuaders dip in certainty at middiscussion and the persuadee's certainty about final opinion increases with time needs further documentation.—*W. W. Meissner.*

2320. Ofshe, R. (U. California, Berkeley) **Cognitive consistency and language behavior.** *Human Relations*, 1970(Apr), Vol. 23(2), 139-151.—Studied 45 S pairs using the semantic differential technique to determine the conditions under which actors will tend to tolerate strain not reduced through consensus or further reduce strain through distortion of perception. For highly relevant signs actors tend to reduce the degree of distortion of the other's connotative meaning. For low relevant signs actors tend to increase the degree of distortion over time. Consensus increases with length of time spent in interaction. (22 ref.)—*W. W. Meissner.*

2321. Singh, Y. P. & Pareek, Udai. (Punjab Agricultural U., Hissar, India) **Communication nets in the sequential adoption process.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 232-246.—The study was conducted in a medium-size, multicaste village near Delhi, India. Main criteria for the selection of practices were recency of introduction and wide adoption. Behavioral products were first studied and then attempts were made to trace all the influences that went into their making. Findings indicate that except for interest and trial stages, communicators increase with each advanced stage of adoption. (20 ref.)—*R. D. Nance.*

Social Perception & Motivation

2322. Carlson, Rae & Levy, Nissim. (National Inst. of Mental Health, Chevy Chase, Md.) **Self, values, and affects: Derivations from Tomkins' polarity theory.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 338-345.—S. S. Tomkins' polarity theory provided the basis for 3 empirical studies exploring the role of ideoaffective postures in personality. In Study I, the humanistic-normative polarity (assessed by taste or smell imagery) was significantly related to interpersonal vs. individualistic bases of self-conception and of value hierarchy in 202 Negro undergraduates. Study II

systematically sampled affective imagery and social-personal orientation, and found both variables significantly related to judgments of facial expressions of emotion in an initial study and in a replication with 40 Ss. Study III found humanistic-normative affective imagery related to students' (N = 20) affective responsiveness in a science education class. Results support Tomkins' formulation by demonstrating the role of ideoaffective postures in organizing personal judgments and choices, and encourage further inquiry on basic cognitive-affective dynamics in personality. (23 ref.)—*Journal abstract.*

2323. Fitch, Gordon. (U. Kansas, School of Business) **Effects of self-esteem, perceived performance, and choice on causal attributions.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 311-315.—135 undergraduates attributed causality for performance in a dot-estimation task to internal and external causal sources. Ss were found to attribute significantly more causality to internal sources for success outcomes than for failure outcomes, supporting a self-esteem enhancement prediction. Low-self-esteem Ss who received failure feedback attributed significantly more causality to internal causal sources than did high-self-esteem Ss, who received failure feedback, thus supporting a self-esteem consistency prediction for low-self-esteem Ss. The prediction of a positive relationship between degree of choice in engaging in the task and internal attribution of causality was not supported. A significant Self-Esteem \times Perceived Performance interaction is discussed, as is an unexpected relationship between internal-external control and self-esteem.—*Journal abstract.*

2324. Helmreich, Robert; Aronson, Elliot, & LeFan, James. (U. Texas) **To err is humanizing—sometimes: Effects of self-esteem, competence, and a pratfall on interpersonal attraction.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 259-264.—Studied the effects on liking for a stimulus person in a $3 \times 2 \times 2$ factorial design varying 120 male undergraduates' self-esteem stimulus-person competence, and the presence or absence of a pratfall by the stimulus person. The competent stimulus person with or without a pratfall was found to be significantly more attractive than his incompetent counterpart. However, Ss of average self-esteem found the attractiveness of a competent person enhanced significantly if he experienced a pratfall, while Ss of high and low self-esteem were significantly more attracted to the superior when he did not blunder. A pratfall did not significantly affect liking for the incompetent stimulus person by any of the self-esteem groups. Ss of low self-esteem volunteered at a higher rate for experimentation than those of high or average self-esteem.—*Journal abstract.*

2325. Kelley, Harold H. & Stahelski, Anthony J. (U. California, Los Angeles) **Social interaction basis of cooperators' and competitors' beliefs about others.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 66-91.—Based on results from previous experiments using the Prisoner's Dilemma game, it is inferred that cooperators will believe others are heterogeneous as to their cooperativeness vs. competitiveness, whereas competitors will believe other persons are uniformly competitive. Evidence relating to authoritarianism, and from a variety of experimental situations is found to confirm this inference. Low authoritarians tend to behave like cooperators in experimental game situations and to have beliefs about other persons similar to

the cooperators' beliefs, whereas high authoritarians exhibit behavior and beliefs consistent with those of competitors. Results illustrate what may be a common phenomenon in personality and social psychology, that a personality predisposition acts through its influence upon the person's social behavior to determine the information he gains from his social environment and, thereby, the beliefs he comes to hold about his world. This analysis provides an explanation in terms of social interaction processes for a "projection" phenomenon previously explained almost exclusively in terms of psychodynamic processes. (43 ref.)—*Journal abstract.*

2326. King, M. G. (Macquarie U., School of Behavioral Sciences, Sydney, New South Wales, Australia) **Sex differences in the perception of friendly and unfriendly interactions.** *British Journal of Social & Clinical Psychology*, 1970(Sep), Vol. 9(3), 212-215.—Studied judgments of social interactions along a friendly-unfriendly dimension, revealing marked cross-sex differences. Ss were 200 male and 200 female undergraduates. With same-sex judgments, males judging male interactions and females judging females, no difference was found. In their judgments of female interactions, however, male judgments were linearly related to female judgments, but the latter scale had a far wider range. In their judgment of male interactions, females had a comparatively restricted range for friendly interactions, but differentiated as well as males in the very unfriendly range. Implications of findings for systematic observation techniques are outlined and implications of sex differences in social perception are discussed.—*Journal abstract.*

2327. Lanzetta, John T. & Kleck, Robert E. (Dartmouth Coll.) **Encoding and decoding of nonverbal affect in humans.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 12-19.—12 male undergraduates viewed a sequence of equally spaced and randomly ordered red and green lights, in which the red light signaled the advent of shock. Continuous skin-resistance measures were taken. Ss nonverbal responses to the red and green stimuli were video taped without their knowledge and were later viewed by themselves and 5 of the other Ss, individually, under conditions which required them to discriminate between shock and nonshock trials. Ss accuracy scores were above chance levels, and significant differences in error rates for stimulus persons but not for judges were found. Ss who were proficient at the discrimination task were themselves poor stimuli for others and vice versa. The degree of physiological reactivity of the Ss was positively associated with the number of errors made to them as stimuli, but negatively related to their error scores as judges. Alternative explanations for this last result are discussed. (27 ref.)—*Journal abstract.*

2328. Lott, Albert J., Lott, Bernice E., Reed, Thomas, & Crow, Terry. (U. Rhode Island) **Personality-trait descriptions of differentially liked persons.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 284-290.—Interpersonal attitudes are inferred from a variety of behaviors, among which should be the words people use to describe each other. Each S in 2 independent samples of 50 and 60 undergraduates listed 3 persons with whom he was very well acquainted but 1 of whom was very well liked, 1 disliked very much, and 1 regarded neutrally. These stimulus persons were then described by adjectives from N. H. Anderson's list of 200 personality-trait words. Results from both samples were

consistent: the number of adjectives used to describe persons varied reliably with interpersonal attraction, in the direction of most to least, from liked to disliked to neutral, supporting theoretical assumptions regarding differences in salience among differentially liked persons. In addition, the particular words chosen to describe well-liked, neutral, and disliked actual persons differed significantly in Anderson's likableness values. Discriminating words were isolated, and a descriptive word measure of interpersonal attraction is suggested.—*Journal abstract.*

2329. Lott, Albert J., Lott, Bernice E., & Walsh, Michael L. (U. Rhode Island) **Learning of paired associates relevant to differentially liked persons.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 274-283.—Independent samples of undergraduates learned to associate the names of public figures (N = 60, Study I), or the names of persons with whom they were very well acquainted (N = 52, Study II), with CVC nonsense syllables (trigrams). In both cases, attitude toward the person whose name was paired with new information made a significant difference in the ease with which the learning took place. Ss made fewest errors in learning relevant to liked persons, most errors in learning relevant to neutrally regarded persons, and an intermediate number of errors in learning relevant to disliked persons. Some evidence was also obtained, in Study II, that the affect evoked by the names of differentially liked persons was conditioned to the trigrams paired with them. Results are discussed in terms of their relevance for the theoretical assumption that differentially liked persons differ systematically in cue and motivational properties. (17 ref.)—*Journal abstract.*

2330. Lowe, Charles A. & Goldstein, Joel W. (U. Connecticut) **Reciprocal liking and attributions of ability: Mediating effects of perceived intent and personal involvement.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 291-297.—24 involved female undergraduates received an evaluation in a live interaction setting, while 24 role players, who observed a videotape of the situation, were asked to imagine that they were the S. The evaluation (positive or negative) was given by an evaluator who had chosen either to be accurate or to gain approval. Ss' perceptions of the evaluator were obtained. Results indicate that: (a) liking was reciprocated, i.e., positive evaluators received positive ratings, negative evaluators received negative ratings; (b) the amount of liking or disliking for the evaluator was greater when she was trying to be accurate than when she was trying to gain approval; and (c) involved Ss liked positive evaluators and disliked negative evaluators more than did role players, and their attributions of ability were biased in the direction of the evaluation valence. Results are discussed in the framework of attribution theory.—*Journal abstract.*

2331. Lowry, Thomas W. (U. Texas) **The effect of training and selected cognitive and personality variables on accuracy of interpersonal judgment.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5692-5693.

2332. Manes, Audrey L. (Stanford U.) **Some determinants of the degree of polarization of first impressions.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5525.

2333. Sweeney, Donald R., Tinling, David C., & Schmale, Arthur H. (U. Rochester, Medical & Dental

School) **Differentiation of the "giving-up" affects: Helplessness and hopelessness.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 378-382.—Hypothesized that expressive excerpts (both graphic and verbal) "representing helplessness would be rated as higher than those representing hopelessness on the evaluation, activity-potency, and object-relatedness dimensions" of a semantic-differential test of affects, and as lower (i.e., less enduring) on the temporality dimension. Ss were 20 normal artists, teachers, and actors experienced in communication of affect, who expressed 13 affects (including helplessness and hopelessness) in verbal, graphic, and facial-postural modes. 20 units of drawing and verbal excerpts were selected for rating. Results support the hypothesis and are discussed in terms of their usefulness in the clinical situation to differentiate between helplessness and hopelessness.—P. McMillan.

2334. Warr, Peter B. & Smith, J. Stuart. (U. Sheffield, Social & Applied Psychology Unit, England) **Combining information about people: Comparisons between six models.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 55-65.—Examines 6 models of the way combined inferences between personal characteristics are predictable from single intertrait inferences including (a) simple descriptive statements of averaging or addition, (b) models to account for asymmetry in A:B and B:A inferences, and (c) models which account for this asymmetry and also incorporate assumptions about the interrelationship between member traits in a pair. A distinction is drawn between intrinsic and extrinsic criteria for evaluating models. On intrinsic criteria the preferred model of those in Class c was found to be most acceptable of the 6 which were examined. It is, however, pointed out that on extrinsic criteria another model might be preferred (23 ref.).—*Journal abstract*.

COMMUNICATION

2336. Beisecker, Thomas. (U. Kansas) **"Game theory in communication research": A reaction and re-orientation.** *Journal of Communication*, 1970(Jun), Vol. 20(2), 107-124.—Raises 3 issues concerning R. N. Bostrom's (see PA, Vol. 43-6857) assumptions underlying his application of game theory to communication research: individuals seek to maximize self-benefit or mutual group benefit, but one cannot do both simultaneously; the probability of consistency of preference, criterion valuation and interval units of identical size is small in real-life situations; and his game theory is based on the solution of an interaction rather than on the communication process through which the solution is derived. In a rejoinder, "Bostrom denies stating that individuals will interact to achieve their greatest mutual satisfaction—but that they ought to, and his purpose was to make possible an analysis of the degree to which particular communicative acts approached this 'ideal.' To restrict game theory to conflict situations (as Beisecker, and past game theorists, have done) is to ignore a potentially valuable tool for communication research. The fact that communicative measurement is complex is not new, nor a valid reason for no attempt being made to accomplish it."—P. Federman.

2337. Brownstone, Paul L. (Long Island U.) **International understanding through communication: One plan-one plea.** *Journal of Communication*, 1970(Jun), Vol. 20(2), 142-152.—Describes an educational radio program established in the country of Colombia in 1947. Other descriptive methods used in other countries, their unique problems of language, and local customs are described. UNESCO's qualifications for involvement in international education are analyzed. A UNESCO university is proposed.—P. Federman.

2338. Dance, Frank E. (U. Wisconsin, Milwaukee) **The "concept" of communication.** *Journal of Communication*, 1970(Jun), Vol. 20(2), 201-210.—Examines definitions of communication as related to the meaning of "concept" as reflected in the literature of the philosophy of science. 15 themes were produced. The definitions critically divide over 3 of the 15 concepts.—P. Federman.

2339. Engel, James F., Blackwell, Roger D., & Kegerreis, Robert J. (Ohio State U.) **How information is used to adopt an innovation.** *Journal of Advertising Research*, 1969(Dec), Vol. 9(4), 3-8.—"Compared with the general population, innovators (patrons of the new automotive diagnostic center in Columbus, Ohio)" are (a) more frequently subscribers to 5 or more magazines; (b) rate themselves as earlier learners of innovations and, correspondingly, hear of an innovation to a significantly greater extent before it becomes available locally; (c) less often act without planning; and (d) make an extensive systematic search for relevant information.—J. C. Franklin.

2340. Goldhaber, Gerald M. (Purdue U.) **Listener comprehension of compressed speech as a function of the academic grade level of the subjects.** *Journal of Communication*, 1970(Jun), Vol. 20(2), 167-173.—Investigated the effects of 2 variables: rate of presentation and academic grade level of the Ss, and their interaction. Compression of speech was achieved electronically with a speech compressor to achieve rates of 165-330 words/min. Significant differences among rates and academic level of Ss were obtained; no significant difference was found in the interaction of the 2 variables.—*Journal abstract*.

2341. Larsson, Inger. (School of Education, Malmö, Sweden) **Increasing the rate of return in mail surveys: A methodological study.** *Didaktometry & Sociometry*, 1970, Vol. 2, 43-70.—Describes measures to increase the rate of return in mail questionnaires. A factorial experiment was made as part of a survey of the extent to which the German language occurs in Swedish business life. Factors used were signing authority and reminder. Signing authorities represented the National Board of Education and the Malmö School of Education, and the forms of reminder were telephone and letter.—*Journal abstract*.

2342. Perelló, Jorge. (Centro Municipal Fonodislogico "J. M. de Porcióles," Barcelona, Spain) **Digressions on the biological foundations of language.** *Journal of Communication Disorders*, 1970(Aug), Vol. 3(2), 140-149.—Applies the methods used to examine mute children to investigate the speech of men of the paleolithic age. An examination of paleolithic figures using the principles of the Goodenough Draw-a-Man Test and tests of handedness shows that: (a) these men possessed a superior language, like that of a 13-yr-old; and (b) prehistoric man was ambidextrous, or that there was a great proportion of left-handers. The cavities of

the speech organ of prehistoric man are also examined in a discussion of the production of sounds and the evolution of language.—*M. Maney.*

2343. Schoenfeldt, Lyle F. (U. Georgia) **Data archives as resources for research, instruction, and policy planning.** *American Psychologist*, 1970(Jul), Vol. 25(7), 609-616.—Discusses the storing and accessing of large resources of data with the dual aim of stimulating scientists to organize data for use in other research purposes, and encouraging potential users to perceive data archives as resources for their particular needs. Major archives are listed and described. Advantages of using existing data files are (a) economy of time and money, (b) the possibility of combining materials from several archives, (c) larger and more representative samples, and (d) reduced bias. The most serious problem is preserving the confidentiality of the information treated. Examples of applications of data banks in the area of research, instruction, and planning of social policy are described. (18 ref.)—*Author abstract*

2344. Sedláček, Karel & Sychra, Antonín. **The method of psychoacoustic transformation applied to the investigation of expression in speech and music.** *Kybernetika*, 1969, Vol. 5(1), 1-28.—Analyzes methods used for study of expression, i.e., the method of direct introspective analysis, behavioristic methods, and the method of the objective investigation of biological reactions, and suggests a combined method—psychoacoustic transformation as a useful complement to the other approaches. The new method compares sentences pronounced before and after listening to the vocal and dramatic music to discover the objective acoustic and physiologic carriers of the emotional expression in speech and music. (Czech summary) (30 ref.)—*G. Steele*

Language

2345. ———. **Comments and queries: Wanted: A better direction for linguistic psychology.** *Psychological Record*, 1970(Spr), Vol. 20(2), 263-265.—Proposes that the psychology of language should deal not with structures of letters or sounds, but study linguistic events as definite adjustments of organisms to 2 simultaneously operating stimulus objects.—*Journal abstract*

2346. Bernard, J. R. (Macquarie U., New South Wales, Australia) **On nucleus component durations.** *Language & Speech*, 1970(Apr), Vol. 13(2), 89-101.—Spectrographically derived measurements of the durations of the component sections of 19 different vocalic nuclei in the h-d frame allow an estimation of the roles of linguistic, individual, and physiological forces in the division of the nucleus into its on-glide, target, etc., and also a tentative ranking of these forces in the order given. Some observations on nucleus duration are included.—*Journal abstract*

2347. Bresson, F., Jodalet, F., & Mialaret, G. **Language, communication et décision.** [Language, communication and decision.] *Traité de Psychologie Expérimentale*, 1969, Vol. 8, 306 p.—A presentation and review in 4 chapters of the experimental literature of language and communication, verbal association, the experimental psychology of reading, writing, and drawing, and decision making. References to the international research literature are given at the end of each chapter.—*N. B. Gordon*

2348. Fishman, Joshua A. (Yeshiva U.) **Bilingualism in the barrio.** *Modern Language Journal*, 1969(Mar), Vol.

53(3), 151-185.—Presents excerpts from a report of bilingualism in a predominantly lower class urban Puerto Rican community in the United States, and aspects of the larger network of communication media and communication elites through which it is tied to the Puerto Rican community of a larger metropolitan area. Those sections of the report judged relevant to language teachers are presented, including papers by J. Fishman, A. Cooper, L. Greenfield, M. Feldman, and T. Berney, dealing with: (a) measurement and description of widespread, relatively stable bilingualism, (b) word frequency estimation as a measure of degree of bilingualism, (c) contextualized measures of degree of bilingualism, (d) contextualization of school children's bilingualism, and (e) semantic independence and degree of bilingualism in 2 communities.—*M. Maney.*

2349. Gay, Thomas. (Haskins Lab., New Haven, Conn.) **A perceptual study of American English diphthongs.** *Language & Speech*, 1970(Apr), Vol. 13(2), 65-88.—Utilized synthetic speech for describing the phonemic boundaries and the effects of formant course on the identification of a group of diphthongs. In Exp. I, synthesized formant transitions appropriate to classes of diphthongs were presented to 10 phonetically trained listeners for purposes of phonemic labeling. Exp. II attempted to determine whether the phonetic identity of the targets on the absolute course of the 2nd formant transition serves as the primary identifying cue. These features were separated along the time dimension by synthesizing diphthongs whose 2nd formant frequency course remained fixed but whose durations varied. Results of the listening tests show shifts in perception from simple vowel to diphthong occurring as a function of duration rather than frequency onset or offset positions. Results suggest that certain diphthong stimuli are characterized by an invariant 2nd formant rate of change, whose onset and offset values vary across changes in duration.—*Journal abstract*

2350. Ghiley, Hoyt M., & Summers, Collier B. (Appalachian State U.) **Sex differences in the use of hostile verbs.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 31-37.—50 male and 50 female undergraduates chose between using either a hostile verb (e.g., stabbed) or a neutral verb (e.g., began) in composing each of a series of 100 sentences. They were given either a personal-reference pronoun (I, we) or an other-reference pronoun (he, they) with which to begin each sentence. Variables were age of S, pronoun type, and block of trials. Male Ss used significantly more hostile verbs than did female Ss. Pronoun type was not a significant variable. Results are explained in terms of sex differences in hostile response tendencies.—*Journal summary*

2351. Kishin, Hirovuki. (Tokushima U., Japan) [Similarity dimensions and legibility of Kana-Kana letters.] *Japanese Journal of Psychology*, 1970(Jeb), Vol. 40(6), 337-340

2352. Krommer, William J. (Vassar Coll.) **Linguistic operations in the analysis of pairs of class-membership statements.** *Psychonomic Science*, 1970(Nov), Vol. 20(4), 219-220.—Successfully predicted the ordering of solution times and error rates in a task comprising the comparison of statements that were logically equivalent but linguistically different by a model involving 2 operations capable of transforming the linguistically differing forms into each other. Ss were 24 undergraduates.—*Journal abstract*

2353. Mackay, C. K., & Brown, W. P. (U. Aberdeen,

Scotland) **Metaphor preference vs. semantic ratings as measures of attitude toward time.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 207-212.—Attitude toward time was assessed by means of Knapp's Metaphor Scale and also by having Ss ($N = 31$ postgraduate students) rate time on 12 semantic rating scales. Correlations were used to assess the extent of agreement between the 2 types of measure. While high correlations were largely absent, the results did seem to form a meaningful pattern. Preference for "dynamic" images of time was more closely related to ratings of time as fast, active, and energetic than to ratings of it as emotional, concerned, or purposeful. Some factors which may have prevented the emergence of high correlations are suggested.—*Journal summary*.

2354. Taylor, Kent B. (1229 Forest Ave., Palo Alto, Calif.) **A Markovian investigation of English language redundancy.** *Psychonomic Sciences*, 1970(Aug), Vol. 20(4), 199-200.—Represented digram letter transition probabilities in the form of a Markov source to test the assumptions of ergodicity and regularity underlying the application of information-theory measures to language-redundancy studies. The source was determined to be ergodic and regular, and sequential letter dependencies were found to be relatively short run. Trigram probabilities predicted by the Markov model were consistently slightly higher than empirical probabilities, demonstrating limitation of such an approach to statistical language analysis.

2355. Weaver, Wendell W., Kingston, Albert J., Bickley, A. C., & White, William F. (U. Georgia, Coll. Education) **Information-flow difficulty in relation to reading comprehension.** *Journal of Reading Behavior*, 1969(Sum), Vol. 1(3), 41-49.—Administered the Modern Language Aptitude Test (MLAT) and Davis Reading Test (DRT) to 53 college sophomores who had previously taken the Cattell 16 PF, the Semantic Differential (SD), and 2 cloze tests. The cloze tests were constructed by deleting every n th word from 2 samples of a story; the SD included rating the protagonist of the story as well as self. Results from a regression analysis using the DRT as the criterion indicate the spelling clues subtest of the MLAT as the largest predictor, accounting for 24% of the variance. The SD protagonist-evaluation and the Words-in-Sentences subtest of the MLAT were also significant variables. Results are suggested to "provide further evidence for the interrelationships of rote learning processes and so-called higher level mental processes."—*R. Wiltz*.

Psycholinguistics

2356. Bodenheimer, A. R. (85 Möhrlistr., Zurich, Switzerland) **Die Sprache der Innigkeit und ihre Anwendung.** [The parlance of sincerity and its application.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 169-174.—Briefly discusses the ways in which sincerity is reflected in speech. Numerous samples are noted of dialogues in which sincerity is present.

2357. Brown, Roger, et al. (Eds.) **Psycholinguistics: Selected papers by Roger Brown.** New York, N.Y.: Free Press, 1970. xviii, 392 p. \$8.95.—Includes R. Brown's major papers on the development of language in childhood, as well as a selection of research and theoretical papers by various authors which provide a sampling of research from early studies dealing with

structural linguistics to later studies concerned with transformational linguistics.

2358. Markel, Norman N. (Ed.) (U. Florida, Communication Sciences Lab.) **Psycholinguistics: Introduction to the study of speech and personality.** Homewood, Ill.: Dorsey, 1969. x, 400 p. \$8.65(paper).—Presents basic background material and comprehensive bibliography of research findings in the field of speech and linguistics. Chapters by various authors include such topics as definition and analysis of language, vocal phenomena that accompany spoken language, linguametric procedures, and personality traits and emotional states.

2359. Martin, Edwin. (U. Michigan, Human Performance Center) **Toward an analysis of subjective phrase structure.** *Psychological Bulletin*, 1970(Sep), Vol. 74(3), 153-166.—A method for ascertaining the subjective organization of English sentences is presented, discussed, and experimentally applied. It is argued that the a priori phrase markers that psycholinguists have been using in theory and research are in need of empirical determination, and that subjective phrasing departs from prescriptive phrasing. It is also shown that relative constituent compactness can be determined empirically.—*Journal abstract*.

2360. Rokeach, Milton; Homant, Robert, & Penner, Louis. (Michigan State U.) **A value analysis of the disputed Federalist papers.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 245-250.—Investigated whether an analysis of the values contained in the 12 Federalist papers whose authorship has been disputed could contribute to determining authorship. 2 judges, who had not previously read the papers or had had previous experience with content analysis, recorded the number of times 24 values occurred in the disputed papers, as well as in 10 Federalist papers known to have been written by Hamilton and in 10 written by Madison. The values in the disputed papers correlated significantly more highly with the Madison papers than with the Hamilton papers. This finding was in accord with recent work assigning the disputed papers to Madison.—*Journal abstract*.

AESTHETICS

2361. Ando, Fukuda. (Keio U., Tokyo, Japan) [Multidimensional analysis of the preference structure for music performances.] *Japanese Journal of Psychology*, 1970(Feb), Vol. 40(6), 330-336.—Applied L. R. Tucker's method of multidimensional analysis to music preference. In Exp. I, 23 Ss evaluated 6 different piano interpretations of a Chopin waltz. Analysis of data shows a 2-dimensional preference structure. In Exp. II, 6 performances of a Schubert lied were used. Results indicate that Tucker's method shows applicability to the field of music preference. Individual preferences are described and reveal relationships among such preferences.—*English summary*.

2362. Gourevitch, M. **A propos d'une méconnue source "des faux-monnayeurs."** [On an unknown source of "The Counterfeiters."] *Encéphale*, 1970(Jan), Vol. 59(1), 67-80.—Presents evidence to suggest that one of the sources of Andre Gide's autobiographical novel, *The Counterfeiters* may have been his contact with a Polish psychoanalyst, Mme. Eugenia Sokolnicka. Evidence suggests that Gide may have been seen by her in treatment for about 6 sessions. Reflections of this in the book are noted.—*W. W. Meissner*.

2363. Hagen, Rochus A. (51 Alter Mühlenweg, Cologne, W. Germany) **Der tonologische Vergleich: Ein methodisches Problem.** [The tonological comparison: A methodic problem.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 133-141.—Briefly describes several problems encountered in attempts to establish comparative similarities between Negro and white spiritual music. Recent investigations concerning phonophotography and ethnomusicology are reviewed. (32 ref.)—B. A. Stanton.

2364. Kitahara, Michio. (Acadia U., Wolfville, Nova Scotia, Canada) **A formal model of syncretism in musical scale.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 175-178.—There are 5 important features in all cases of syncretism. The concept of syncretism in music is well accepted. A new form of music emerges as a result of fusion of 2 traditions. Little is known beyond this point. This paper examines the phenomenon by use of a model. The ideas of Ehrenfels regarding melody are developed. A study by the author supports his model.—R. D. Nance.

2365. Knobloch, Ferdinand; Juna, Jaromir; Junová, Hana, & Koutský, Zdeněk. (U. Karlova, Prague, Czechoslovakia) **On an interpersonal hypothesis in the semiotic of music.** *Kybernetika*, 1968, Vol. 4(4), 364-382.—Examines the concept that music is a sort of nonverbal language conveying meanings to listeners. Reasons are given for the hypothesis that the works of music signify interpersonal tendencies understood and reacted to by the listeners who participate in fantasy on the interpersonal transactions of the composer. Some links are shown which connect the present problem with semiotic, general systems theory, psychology both normal and pathological, psychoanalysis and ethology. (Czech summary)—*Journal abstract*.

2366. Sloane, Patricia. (New York U.) **Art and art token in tests involving art evaluation.** *Psychological Record*, 1970(Spring), Vol. 20(2), 191-196.—Examines the nature of the art token (reproduction), its function as a test variable, suggested controls, and the degree of generalization which can be correctly inferred from any test involving tokens.—*Journal abstract*.

SMOKING & DRUG & ALCOHOL USE

2367. DeFleur, Lois B. & Garrett, Gerald R. (Washington State U.) **Dimensions of marijuana usage in a land-grant university.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 468-476.—Reports an attempt to measure marihuana usage at a Western university. Users and nonusers of various types are compared, and their beliefs about the nature and effects of marihuana are summarized. Opinions concerning changes in laws related to the drug are explored. The major findings from a number of studies on the student use of the drug are summarized.—*Journal abstract*.

2368. Flynn, William R. (16542 Ventura Blvd., Encino, Calif.) **The pursuit of purity: A defensive use of drug abuse in adolescence.** *Adolescence*, 1970(Sum), Vol. 5(18), 141-150.—Describes 5 adolescent psychotherapy cases to illustrate the use of psychedelic drugs as an ascetic defense against psychosocial and psychosexual maturity.—A. B. Warren.

2369. King, Francis W. (Dartmouth Coll., Health Service) **Anonymous versus identifiable question-**

naires in drug usage surveys. *American Psychologist*, 1970(Oct), Vol. 25(10), 982-985.—Compared the advantages of different forms of questionnaires used in drug surveys: completely anonymous, consciously identifiable, short forms, and long forms. Despite predictions to the contrary, the anonymous questionnaire did not yield a significantly higher percentage of returns nor of admissions of use of 2 illegal drugs (marihuana and LSD).—*Author abstract*.

2370. Zerssen, D., Stephan, E., & Kaiser, I. (U. Heidelberg, Psychiatrische & Neurologische Klinik, W. Germany) **Der Schlafmittelmisbrauch und seine Verhütung.** [Misuse of sleeping pills and its prevention.] *Nervenarzt*, 1968(Oct), Vol. 39(10), 459-464.—Cites numerous investigations to illustrate widespread misuse of sleeping medications. The need for internists and psychiatrists to keep prescription of hypnotics and sedatives to a minimum as an aid in the prevention of drug dependency and suicide is emphasized. (107 ref.)—B. A. Stanton.

PERSONALITY

2371. ———, Harrison G. Gough. *Revue de Psychologie Appliquée*, 1970, Vol. 20(1), 59-66.—Presents a resumé of H. G. Gough's work. (98 ref.)—K. J. Hartman.

2372. Felker, Donald W. & Hunter, Dede. (Purdue U.) **Sex and age differences in response to cartoons depicting subjects of different ages and sex.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 19-21.—Investigated differences in responses to humor between males and females, and between adolescents and adults. 6 boys and 6 girls 14-17 yr. old, and 6 men and 6 women over 21 yr. old served as Ss. The age and sex of the individual who was the subject of the cartoon humor was investigated also to determine if this aspect was also a factor in humor response. Sex and age differences in response were found. Females rated the cartoons as funnier than males and adults rated them as funnier than adolescents. The subject within the cartoon did not differentially influence the humor rating.—*Journal summary*.

2373. Geiwitz, P. James. (Stanford U.) **Non-Freudian personality theories.** Belmont, Calif.: Brooks/Cole, 1969. xi, 147 p.—Presents a brief description of the essential ideas of the more prominent personality theories of contemporary psychology, using an issue rather than a survey approach. Theories discussed include those of Gordon Allport, Gardner Murphy, Henry Murray, Carl Rogers, and Kurt Lewin.

2374. Soueif, M. I. & El-Sayed, A. M. (Max Planck Inst. of Psychiatry, Munich, W. Germany) **Curvilinear relationships between creative thinking abilities and personality trait variables.** *Acta Psychologica, Amsterdam*, 1970(Sep), Vol. 34(1), 1-21.—Administered creative thinking tests and personality questionnaires to 216 Egyptian males whose mean age was 23.16 yr. (± 1.54). Product-moment correlations between all the test variables were run. Most of the correlations within each area, i.e., creativity and personality, were statistically significant, but those between the 2 sets of variables did not differ significantly from 0. Principal component analysis was carried out. 10 principal axes factors were extracted, but only 8 could be identified. Correlation ratios were computed between personality variables and creativity test scores. Most of the corre-

lations were highly significant. Moderator variable analysis was then carried out and was shown to reveal interaction effects among personality variates in determining creativity test scores.—*Journal abstract.*

PERSONALITY TRAITS & PROCESSES

2375. Ahrens, Hans J. (U. Heidelberg, Psychologische Inst., W. Germany) **Zur Systematik von Sitzplatzwahlen.** [The systematics of seat choices.] *Psychologische Beiträge*, 1969, Vol. 11(3), 349-367.—Investigated the behavior of student's choice of seats in lecture rooms. First, Ss simulated seat choices. Factor analysis showed that choice of seats could be described by 4 factors. In discussing Ss' reasons for choices, distinctions were made between individual and social motives. Then the behavior of the same Ss was observed in real lecture situations. Prediction on the basis of the results of the experiments could be corroborated for a certain group of the Ss. (French summary) (22 ref.)—*English summary.*

2376. Boshier, Roger. (Victoria U., Wellington, New Zealand) **Self-regarding attitudes: A bibliography.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 218.—Describes the background of the notions of self and self concept and presents a bibliography covering pre-1961 references.

2377. Fitch, Henry G. (Purdue U.) **The effects of self-esteem, I-E control, success-failure, and choice on causal attribution.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5522-5523.

2378. Jurovský, Anton & Vopálenký, Ján. **Integrácia osobnosti a sociálna začlenenosť mladistvých.** [Personality integration and social adjustment of youth.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(1), 3-14. Studied the relationship between personality traits and external determinants and hypothesized that it is possible to verify them on personality integration and some aspects of social adjustment. An apparatus, which tests the degree of behavior disorganization under conditions of stress, was used with 48 16-17 yr. olds. In addition, Ss were given the California Test of Personality, Jurovský's Social Proximity Scale and a sociometric test. Results suggest that: (a) the attempt at measuring integration and disintegration of personality under stress conditions was successful, and (b) correlations between the disintegration index and some personality traits were found, indicating a connection between personality traits directly contributing to the socialization of the individual and structural personality traits. (Russian summary)—*English summary.*

2379. Lish, Joan A. (New York U.) **The influence of oral dependency, failure, and social exposure upon self-esteem and depression.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5692.

2380. McArthur Leslie A. (Brandeis U.) **Luck is alive and well in New Haven: A serendipitous finding on perceived control of reinforcement after the draft lottery.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 316-318. A serendipitous finding supports J. B. Rotter's proposition that individual differences in generalized expectancy for internal vs. external control of reinforcement depend upon the individual's history of reinforcement. The Internal-External (I-E) Locus of Control scale was administered to 23 male undergraduates on the day following the draft lottery. Those who were 19 or older and were therefore affected by the lottery showed a greater expectancy for

external control of reinforcement than a control group of Ss to whom the I-E scale was administered prior to the lottery ($p < .10$). A breakdown of experimental Ss into 2 groups—those who were favorably affected by the lottery and those who were not favorably affected by it—revealed that the former group showed significantly more externality than the latter ($p < .05$) and largely accounted for the greater externality of experimental Ss as compared with controls.—*Journal abstract.*

2381. Mitchell, Terence R. (U. Illinois, Group Effectiveness Research Lab.) **Leader complexity and leadership style.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 166-174.—Using 60 undergraduates, it was found that F. E. Fiedler's estimate for one's Least Preferred Coworker (LPC) scale was positively correlated with an individual's cognitive complexity. This hypothesis was supported in several ways. The LPC score was correlated with a measure of cognitive complexity similar to the scale used by W. A. Scott. High-LPC Ss also showed more complex cognitions in making judgments about task settings than did low-LPC Ss. And finally, high-LPC Ss had more complex cognitions in their perceptions of actual behavior and of other coworkers. This information is integrated into Fiedler's theory of leadership effectiveness and a number of new approaches are suggested. (22 ref.)—*Journal abstract.*

2382. Montagu, Ashley. **Social interest and aggression as potentialities.** *Journal of Individual Psychology*, 1970(May), Vol. 26(1), 17-31.—Adler's conception of social interest and Montagu's view of the causes of aggression in man find a common basis in the development of potential. (36 ref.)—*A. R. Howard.*

2383. Morse, Stan & Gergen, Kenneth J. (U. Michigan) **Social comparison, self-consistency, and the concept of self.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 148-156.—78 undergraduate job applicants casually encountered a stimulus person whose characteristics were either socially desirable or undesirable. $1/2$ the Ss in each of these conditions found the other was competing with them for the same position, and $1/2$ did not. Preliminary assessments were also made of the Ss' level of self-consistency. The major dependent variable was self-esteem change. As predicted by comparison theory, the socially desirable stimulus person produced a significant decrease in self-esteem, while the undesirable other significantly enhanced Ss' self-estimates. Ss low in self-consistency were most affected by the presence of the other, while extent of competition had no effect. It was also found that similarity between Ss and stimulus person tended to enhance self-esteem, while dissimilarity tended to reduce it. (21 ref.)—*Journal abstract.*

2384. Shotland, R. Lance & Berger, Wallace G. (City Coll., City U. New York, Graduate Center) **Behavioral validation of several values from the Rokeach Value Scale as an index of honesty.** *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 433-435.—Of 131 female line workers responding to an attitude questionnaire, 39% returned the scoring pencil which was furnished with their questionnaire. It was hypothesized that the act of returning the pencils was related to the employee's feelings about being honest. As the great bulk of the employees were members of strict religious denominations, it was also hypothesized that the act of returning the pencils might be related to the hoped for attainment of a religious end state, i.e., salvation. Honest

and Salvation are 2 of 36 values of the Rokeach Value Scale. Results are consistent with the hypotheses. In addition 2 other values, A World At Peace and Helpful appeared to distinguish between pencil returners and nonreturners. The Rokeach Value Scale may prove to be a potentially useful predictor of honesty in a corporate setting.—*Journal abstract.*

Behavior Correlates

2386. Auvenshine, C. D., Smith, D. F., & Henaghan, M. B. (U. Kentucky) *Need for achievement: Relation to academic achievement and inventoried needs.* *SPATE Journal*, 1970, Vol. 8(4), 105-114.—4 groups of students were selected on the basis of need for achievement scores on the EPPS and their GPAs. Groups were (a) high need/high achievement, (b) high need/low achievement, (3) low need/high achievement, and (d) low need/low achievement. Significant differences were found that form patterns differentiating among the various groups. Differences were on scales of abasement, affiliation, autonomy, deference, intraception, and nurturance.—S. M. Amatora.

2387. Becker, Gilbert. (U. Manitoba, Winnipeg, Canada) *Situational discrimination in repressor-type and sensitizer-type approval seekers and the birth order by subject sex interaction.* *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 81-97.—5 experiments in which special instructions created the opportunity for situational discrimination. Repressor-type high need for approval Ss made the discrimination and permitted less favorable self-description, but sensitizer-type high need for approval Ss did not. Birth order and sex cross-classification analysis suggest the Gerard-Rabbie effect for both types of approval scales under neutral instructions and for the sensitizer-type scale alone under special instructions; i.e., 1st-born females scored highest, later-born males and females scored intermediately, and 1st-born males scored lowest. Overall score, instruction effect, and birth order by sex interaction varied considerably from population to population on the repressor-type approval scale, but were relatively stable on the sensitizer-type approval scale. (16 ref.)—*Journal summary.*

2388. Bettinghaus, Erwin; Miller, Gerald, & Steinfatt, Thomas. (Michigan State U.) *Source evaluation, syllogistic content, and judgments of logical validity by high- and low-dogmatic persons.* *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 238-244.—Investigated the conditions that facilitate judgment of an argument's validity. 120 high- and low-dogmatic Ss were matched by group for reasoning ability and randomized to positive- and negative-source conditions. Each S judged the logical validity of 16 syllogisms which were counterbalanced on the basis of a pretest. 2 hypotheses were tested: (a) when syllogisms are attributed to positive and negative sources, low dogmatics will make a significantly greater number of accurate judgments of validity than will high dogmatics; and (b) high dogmatics will make more accurate judgments of validity under conditions of positive sources and valid syllogisms and under conditions of

negative sources and invalid syllogisms. Conversely, low dogmatics will be more accurate under conditions of positive sources and invalid syllogisms and under conditions of negative sources and valid syllogisms. A 4-factor analysis of variance supported both hypotheses. Results are discussed as consistent with M. Rokeach's dogmatism theory, and the effect of certain syllogistic forms on the judgmental ability of high- and low-dogmatic Ss is considered. (20 ref.)—*Journal abstract.*

2393. McCashia, Andrew W. (U. Georgia) *Repression-sensitization behavior in a verbal conditioning paradigm.* *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5694.

2394. McLaughlin, Barry. (U. California, Santa Cruz) *Incidental learning and Machiavellianism.* *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 109-116.—Compared 200 male undergraduates scoring high and low on the Mach IV Scale as to their willingness to engage in manipulatory behavior towards a fellow student (actually a confederate). High Mach Ss were found to be more manipulative, but to show poorer incidental verbal learning than low Mach Ss. Results are interpreted as indicating that high Mach Ss restrict their attention more to the manipulatory possibilities of the situation and ignore nonrelevant cues.—*Author abstract.*

2395. Mendelsohn, Gerald A., & Gail, Meredith D. (U. California, Berkeley) *Personality variables and the effectiveness of techniques to facilitate creative problem solving.* *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 346-351.—Related the effectiveness with which Ss used various techniques for facilitating creative problem solving to individual differences on the MMPI A and R scales, the Achievement Anxiety Test, and the Adjective Check List. 2 groups of Ss, designated high facilitation (N = 25 males and 25 females) and low facilitation (N = 29 males and 25 females), were formed on the basis of relative enhancement of performance following exposure to a facilitating technique. No reliable personality differences were found for males. For females, the effect of personality was contingent on the sex of the E. Low-facilitation female Ss matched with male Es appeared dissatisfied with themselves and others, preoccupied with personal problems, and ill at ease in social situations, however, no differences were found between low- and high-facilitation females matched with female Es. Results are discussed in terms of the interaction between personality traits and social contexts and their implications for the methodology of evaluating effectiveness of facilitating techniques. (16 ref.)—*Journal abstract.*

2396. Sadler, Timothy G. (U. Houston) *The role of*

extraversion and neuroticism in human operant conditioning. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5723.

2397. Sheridan, Kathleen & Shack, John R. (Loyola U.) **Personality correlates of the undergraduate volunteer subject.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 23-26.—10 male and 13 female undergraduate volunteers for 7 weekly sensitivity training sessions performed differently on 2 personality inventories than did 58 nonvolunteers. Volunteer students who were given the Personal Orientation Inventory and the Epistemic Orientation Inventory were significantly more accepting of themselves and significantly less dependent on their environment for motivation than nonvolunteers. Results are discussed in light of recent studies of the college volunteer for psychological experiments.—*Journal summary*.

2398. Stein, Richard S., Stein, Adele B., & Kagan, Jerome. (Harvard U.) **The effects of ordinal position and identification on the development of philosophical attitudes.** *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 13-24.—Conducted 2 studies to examine a number of hypotheses concerning the relation between ordinal position, identification, and the philosophical attitudes included in the dimension connectedness/disconnectedness. Aspects of connectedness include respecting tradition, seeing man as noble, thinking synthetically, and believing the world is rational; disconnectedness involves opposite attitudes. Ss were 54 male and 100 female undergraduates. Among males, 1st born identifiers tended toward connectedness and later born identifiers tended toward disconnectedness. Among females this relation was not found. It is suggested that 1st and 2nd borns learn different values in the process of identification with parents. The failure to replicate this with female Ss was attributed to the fact that items used were not relevant to female Ss.—*Journal summary*.

2399. Watson, David L. (U. Hawaii) **Anxiety and the structure of motivation.** *Gawain*, 1969(Mar), Vol. 17(2-3), 122-133.—Discusses the relationship between anxiety and the expectations and evaluations which a person has about his own behavior. Structure is defined as the temporal organization of behavior, with emphasis on the evaluative aspects which guide behavioral sequences. Much evaluative behavior is concerned with information seeking so that adequate tests may be performed, and the effects of uncertainty are discussed. It is hypothesized: (a) that the effects of uncertainty while performing avoidance responses should produce anxiety; (b) avoidance behavior would be contingent on a matrix of self-evaluational tests and would produce anxiety; and (c) general uncertainty produces emotionality, but that this has differential informational effects upon different individuals, depending upon their previous emotional state. The value of an outcome, and attendant uncertainty, are discussed.—*Journal abstract*.

INTELLIGENCE

2400. ———. **Innate Intelligence: Another genetic avatar.** *Psychological Record*, 1970(Win), Vol. 20(1), 123-130.—Considers the teachings of genetics and objective psychology which should expunge the dogmas of heredity vs. environment and nature vs. nurture, and the doctrine that behavior and its qualities can be generationally transmitted.—*Journal abstract*.

2401. Hersh, Jeffrey B. (Indiana U.) **The influence**

of biased referral reports in a clinical testing situation. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5688.

2402. Oleron, P., Piaget, J., Inhelder, Bärbel, & Greco, P. **L'intelligence.** [Intelligence.] *Traité de Psychologie Expérimentale*, 1969, Vol. 7, 220 p.—Presents a broadly conceived discussion of intelligence, including 4 chapters on: (a) types of activities involving intelligence, (b) mental imagery, (c) intellectual operations and development, and (d) learning in relation to the nature of intelligence. References to the international research literature are given at the end of each chapter.—N. B. Gordon.

2405. Udvardi, Josef. **Le diagnostic intellectuel.** [Diagnosis of intelligence.] *Information Psychologique*, 1968(Feb), No. 29, 37-46.—Presents a brief review of intelligence tests.—S. G. Vandenberg.

CREATIVITY

2406. Lake, A. E. & Tedford, W. H. (Oberlin Coll.) **Influence of creativity on formation of subjective units.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 227-237.—24 Ss viewed 2 series of slides and imitated them during free recall. The 2nd series was the same for all Ss, but $\frac{1}{2}$ of the items on it made up the 1st series for 12 Ss. Ss were also divided into 4 groups: creative in (a) the context of meaning (b) the context of novelty, (c) neither, or (d) both contexts. Results indicate: (a) less creative Ss did not organize the stimuli as effectively, (b) both forms of creativity involve subjective organization, and (c) part-whole learning interferes with motor recall. (27 ref.)—*Author abstract*.

PERSONALITY MEASUREMENT

2407. Bailey, Stephen T. (Veterans Administration Hosp., Waco, Tex.) **Independence and factor structure of self-concept metadimensions.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 425-430.—Examined 12 of D. Super's 13 self-concept metadimensions for independence and underlying factor structure. Ss were a heterogeneous group of 50 18-35 yr. old males. Self-descriptive data were obtained from interviews and self-ratings on personal constructs elicited by the Kelly Role Construct Repertory Test. A 14×14 matrix of 91 intercorrelations, which included 2 demographic variables, yielded 19 significant rs with none greater than .57 and only 4 which were .40 or higher. A principal components factor analysis yielded 5 orthogonal factors: (a) self-concept harmony, (b) self-concept change, (c) social integration and self-differentiation, (d) cognitive complexity, and (e) concrete self-realism. Results indicate that some metadimensions lack clear independence and that a simpler structure could be obtained which accounted for 65% of the variance. (19 ref.)—*Journal abstract*.

2408. Graff, Robert W., et al. (Southern Illinois U.) **The POI: A validity check.** *Educational & Psychological*

Measurement, 1970(Sum), Vol. 30(2), 429-432.—The Personal Orientation Inventory (POI) was administered to 71 dormitory assistants. Students on their floors rated them on order, quasi-counseling, model role, leadership, referral agent, and identification in a semantic differential procedure. Canonical correlations were found. The 1st and only significant canonical accounted for 52% of the variance. POI variables involved were inner-directed, self-actualizing, and spontaneity.—*N. M. Chansky.*

2409. Gross, Steven J. & Moore, Samuel F. (U. Cincinnati) **The portable Rod-and-Frame Test and the short-form embedded-figures test: A combined index of the field-dependence/independence dimension.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 213-214.—Explored the utilization of the portable Rod-and-Frame Test and the short-form embedded-figures test as a combination index of the field-dependence/independence dimension that takes no longer in administration time than a single standard test. Ss were 203 male undergraduates. Both normative data and the relationship between these instruments are presented. Marked scatter for the field-dependent Ss on these 2 measures was found. An alternative strategy for selecting Ss is discussed.—*Journal abstract.*

2410. Hogan, H. Wayne. (Tulane U.) **Reliability and convergent validity of a symbolic test for authoritarianism.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 39-43.—Employed the semantic differential and the verbal Adorno F-scale as criterion measures for checking the reliability and convergent validity of a symbolic, nonverbal test for authoritarianism. Data for 72 undergraduates indicate sufficient reliability and validity to warrant further experimentation with the symbolic measure, using larger and more heterogeneous samples of Ss and different kinds and greater numbers of symbols.—*Author abstract.*

2411. Mehrabian, Albert. (U. California, Los Angeles) **The development and validation of measures of affiliative tendency and sensitivity to rejection.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 417-428.—The affiliative tendency scale measures the expectation of a positive reinforcing quality in others; the rejection scale, a negative expectation. The results of the factor analyses of test scores from 4 samples revealed that some recurrent factors extracted were not always the same. Test-retest reliability over a 4-wk period was .89. Scores for affiliative tendency were uncorrelated with social desirability. Correlations with achievement were also low. In another study, dependency could be viewed as a sum of affiliative tendency and sensitivity to rejection. Finally, persons sensitive to rejection were less willing to associate with persons holding attitudes different from their own. (17 ref.)—*N. M. Chansky.*

2412. Rotter, George S. & Tinkleman, Vera. **Anchor effects in the development of behavior rating scales.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 311-318.—Judgments of personal adjustment suggested by items on a behavior rating scale were made by 56 male undergraduates. Ss also took the Marlowe-Crowne Social Desirability scale. The 1st 10 items on the behavior rating scale were anchored toward the maladjustment or adjustment side. Results indicate that neutral items are judged on contrast to the anchors. Adjustment anchors were associated with the rating of neutral items toward the maladjustment side. High approval Ss rated neutral items as more maladjustment than did low

approval Ss given the same adjustment anchor.—*N. M. Chansky.*

2413. Stewart, Roger G. (Central Washington State Coll.) **Some effects of reversing certain items in the Rokeach Dogmatism Scale.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 327-336.—The Rokeach Dogmatism Scale was administered to 58 college freshmen and sophomores. A revised version of the scale containing 20 reversed and 20 original statements was administered to 76 Ss from the same population. Responses were anonymous. The means of the 2 groups were the same for the 20 original items, but the means of the 2 groups differed on the items which were reversed for the 1 group but not for the other. A strong disagreement with the reversed items was noted. Measures of internal consistency indicated that sets of scores for the 1st group correlated about .5; for the 2nd, about -.15.—*N. M. Chansky.*

Inventories

2414. Mehryar, A. H. (Pahlavi U., Shiraz, Iran) **Some data on the Persian translation of the EPI.** *British Journal of Social & Clinical Psychology*, 1970(Sep), Vol. 9(3), 257-263.—Reports preliminary data regarding a Persian translation of the Eysenck Personality Inventory (Form A). The test is found to have a satisfactory degree of reliability and validity in its new context. Iranian Ss, both normal (150 18-23 yr. old students) and abnormal (50 18-57 yr. old mental patients), were found to score significantly higher than their British counterparts on both Neuroticism and Lie scales. The Extraversion scale is found to be virtually independent of the other 2 scales and, unlike them, is not affected by instructions to fake good or bad. Findings are interpreted in the light of other cross-cultural findings with the Inventory. (19 ref.)—*Journal abstract.*

Projective Techniques

2415. Hiltmann, Hildegard. (U. Freiburg, Psychologische Inst., W. Germany) **Persönlichkeitsdiagnostik.** [Personality diagnostics.] *Praxis der Psychotherapie*, 1969(Jan), Vol. 14(1), 34-40.—Chronologically traces the development of projective tests and discusses variations in rank order of frequency of use of tests from 1947-1964. Efficacy of projective development is reduced under stress producing conditions. Proposes that projective test results are influenced by the functional interdependence of 3 components: (a) the specific structure of test instruments, (b) the structure of attitudes toward reactions of the S, and (c) the characteristics and abilities of the S. (15 ref.)—*B. A. Stanton.*

2416. Verger, Don M. & Camp, William L. (Wisconsin State U.) **Early recollections: Reflections of the present.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 510-515.—In spite of the fact that knowledge about the projective technique of early recollections has been available for nearly 50 yr., few counselors or therapists currently use it in their practice. In common with most projective techniques, its use constitutes an art almost as much as it does a science. What makes the use of early recollections unique among the projectives is that in terms of time and cost it is probably the most economical technique presently available to the psychologist. Its use can provide the clinician with a quick glance at the individual's life-style. In addition, the use of

early recollections stands out among the projectives as being the only one which is completely unstructured. The theory of early recollections is summarized in a way that suggests its adaptation to current practice in counseling and psychotherapy. (23 ref.)—*Journal abstract*.

Rorschach Test

2417. Alkoff, Thomas D. (Syracuse U.) **An investigation of the affective meanings of the Rorschach inkblot plates.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5682.

2418. Philipp, Rudolph L. & Wilde, Gerald J. (Queen's U., Kingston, Ontario, Canada) **Stimulation seeking behaviour and extraversion.** *Acta Psychologica, Amsterdam*, 1970(Jun), Vol. 32(3), 269-280.—According to Eysenck, extraverts require more external stimulation than introverts in order to maintain optimal arousal levels. Ss were 287 undergraduates. Manipulation of stimulation was attempted, by markedly reducing sensory input without S's prior expectancy, thereby minimizing the possible occurrence of differential demand characteristics. 7 measures of extraversion were used to select the final S samples (N=66). A lever-pulling task was reinforced with light and music. Extraverts had significantly higher initial and overall response rates than introverts. Predicted performance decrements and reminiscence were not manifested. Findings concerning extraverts' higher need for stimulation are discussed in terms of Eysenck's theory, hedonic value of reinforcement, differential drives, and time-out from positive reinforcement. (41 ref.)—*Journal abstract*.

CLINICAL PSYCHOLOGY

2419. Adler, Alfred. **Fundamentals of individual psychology.** *Journal of Individual Psychology*, 1970(May), Vol. 26(1), 36-49.—1st English translation of a paper which appeared originally in a 1930 book by F. Giese. Included in this overview of individual psychology are comments on inferiority feeling and compensation, origins of mistaken goals, fear of failure, rational approach to education and psychotherapy, and masculine protest. The paper is assumed to have been written in 1926. (26 ref.)—A. R. Howard.

2420. Fijałkowski, W. (Medical Academy, Lodz, Poland) **Current trends in psychoprophylaxis of pregnancy and labor.** *Polish Medical Journal*, 1969, Vol. 8(3), 768-775.—Reviews changes in delivery methods in modern obstetrics. A survey of the methods for the psychophysical preparation of women for painless delivery revealed that 3 aspects must be dealt with: fear, pain, and physical conditions. It is concluded that psychoprophylaxis in its attempt to reintegrate the maternal attitude is a borderline area between obstetrics and psychology and is an important contribution to obstetrical methods. (29 ref.)—G. Steele.

2421. Hall, Bernard H. **Psychiatric consultations: When should a physician refer a patient to a psychiatrist?** *Menninger Quarterly*, 1968-1969(Win), Vol. 22(4), 1-7.—Identifies those groups of patients for whom it is recommended that physicians employ a policy of early referral to psychiatric counseling. These groups include: hospitalized children, patients with organic brain disease, and patients with medical and surgical

problems with psychiatric components. The function of psychiatric consultation in these cases is defined as estimating the nature and severity of the patient's emotional difficulties, advising on further treatment, and assisting the referring physician in helping the patient accept the need for counseling. It is stressed that referral is a "2-way street" and that the psychiatrist may often be the 1st to see patients who also require medical care.—M. Maney.

2426. Luria, A. R. **Psikhologicheskaya nauka i ee mesto v klinicheskoi meditsine.** [Psychological science and its place in clinical medicine.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(1), 22-31.—Discusses the interdisciplinary aspects and contributions of contemporary psychology which views clinical medicine as concerned with an "ill person and not with only the illness." Neuropsychology is discussed at length.—I. D. London.

2427. McCulloch, Warren S. (Massachusetts Inst. of Technology) **Of I and it. Perspectives in Biology & Medicine**, 1969(Sum), Vol. 12(4), 547-560.—Discusses the experiential meaning of "I", "me", or "mine" to describe an event or object as opposed to "it" or "its." The central thesis is: "Those events that occur as intended may be experienced by the actor as 'I, me, mine'; all else, as 'it.'" The clinical implications of patients' choice of language is extensively analyzed in this framework.—J. Crabbe.

2428. Morkovkin, V. M. P. P. **Kashchenko.** *Zhurnal Nevropatologii i Psikhatrii*, 1970, Vol. 70(2), 278-279.—Recounts the life and work of P. P. Kashchenko (1858-1920), noted for his contributions to the organ-

ization and development of psychiatric care in Russia.—I. D. London.

2429. Ritvo, Edward R. (U. California, Medical School, Los Angeles) **Contributions of sleep research to the understanding and treatment of enuresis.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 117-122.

2430. Rogovin, M. S. **Problema ekspressii i ee mesto v psikhopatologii.** [The problem of expression and its place in psychopathology.] *Zhurnal Nevropatologii i Psikhatrii*, 1970, Vol. 70(2), 280-289.—Presents a continuation of the survey of non-Soviet research on expression in psychopathology (see M. S. Rogovin, PA, Vol. 45:Issue 1). Additional areas surveyed include: (a) the experimental investigation of expression and its findings, (b) main theories of expression, and (c) the perception and evaluation of expression in connection with certain personality characteristics. (88 ref.)—I. D. London.

2431. Rosenblum, Gershen. (Massachusetts Dept. of Mental Health, Dedham) **Social intervention: Consultation to organizations.** *Mental Hygiene*, 1970(Jul), Vol. 54(3), 393-396.—Defines and clarifies 7 different consultant models: medical, resource, intramural administrative, counselor, mental health, consultant trainer, and change agent. The 4 common phases are: preparatory, beginning, problem-solving, and termination. 2 case studies demonstrating these principles are submitted.—A. M. Cawley.

2432. Schrenk, Martin. (U. Freiburg, W. Germany) **Griesingers neuropsychiatrische Thesen und ihre sozialpsychiatrischen Konsequenzen.** [Griesinger's neuropsychiatric theses and their social psychiatric consequences.] *Nervenarzt*, 1968(Oct), Vol. 39(10), 441-450.—Reviews G. W. Griesinger's contributions to neuropathology and psychopathology. The impact of the medico-scientific approach to mental illness is discussed as a retarding influence on the development of social psychiatry. (53 ref.)—B. A. Stanton.

2433. Shakman, Robert. **Indigenous healing of mental illness in the Philippines.** *International Journal of Social Psychiatry*, 1969(Fal), Vol. 15(4), 279-287.—Considers the practice of Philippine indigenous healers, how their areas of success relate to Philippine culture, and the role of the healer in Philippine medicine and society. Philippine culture is discussed with consideration of lability of emotion, structure of the family, development of individual identity and responsibility, and the tendencies in psychopathology to somatization and projection. Interviews were conducted with indigenous healers and their patients in diverse areas of the Philippines and treatment of the patients observed. A degree of success in the treatment of psychosomatic conditions was noted. Some healers are aware of the psychological basis of many somatic complaints and of the need to refer organic disease to physicians. The indigenous healer is the primary provider of psychiatric therapy to the vast majority of Filipinos who are geographically or culturally remote from psychiatric treatment administered by physicians. (17 ref.)—*Journal summary*.

2434. Stewart, Mark A., Thach, Bradley T., & Freidlin, Miriam R. (Washington U., Medical School) **Accidental poisoning and the hyperactive child syndrome.** *Diseases of the Nervous System*, 1970(Jun), Vol. 31(6), 403-407.—Suggests a relationship between hyperactivity and the actions of a child who has accidentally taken poison, and that knowledge of such an association could

have "practical implications for preventing accidental poisoning." Using a random sample of 179 poisoning reports filed during 1961, parents and teachers of 87 accidentally poisoned children were interviewed in regard to the poisoning episode, behavior of the child since then, present behavior, and medical, family, and school history. The incidence of the hyperactive child syndrome in a control population was ascertained from an earlier study of 46 1st graders and their 93 siblings. Results suggest that 1 out of 4 accidental poisoning cases showed hyperactivity later in grade school in contrast to 1 out of 17 for the population as a whole. Evidence supported previous investigations which found that (a) poisoned children are more often described as behavior problems than control children, (b) "at least some hyperactive children behave abnormally at an early age," and (c) "hyperactivity is a variant of temperament which is relatively stable over a child's life." It is suggested that children who have accidentally poisoned themselves should be studied carefully for behavior suggesting the hyperactive child syndrome.—P. McMillan.

2435. Vitek, Pavel. **O preferenci léčebných metod.** [On preferences of treatment methods.] *Kybernetika*, 1968, Vol. 4(4), 383-390.—Discusses a mathematical pattern of several methods of treatment of 1 disease with similar results to determine preferential relations among these methods according to their secondary effects which are characterized by secondary parameters. The numerical evaluation of the transformation of the parameters before and after application of the treatment are presented on the bases of medical experience and knowledge. A function was constructed referred to as the function of gain. The criterion for classification of methods of treatment according to the effects of the set of secondary parameters considered will render the average gain values of each method.—*English summary*.

2436. Wittrig, John; Anthony, E. J., & Lucarno, H. E. (Veterans Administration Hosp., Murfreesboro, Tenn.) **An ashing technique for endogenous lithium in human brain and other biological tissues.** *Diseases of the Nervous System*, 1970(Jun), Vol. 31(6), 408-411.—Discusses problems in the recovery of endogenous lithium, various unsatisfactory methods previously used, and a new reliable method "using a combination of wet digestion in nitric and sulfuric acid, then dry-ashing." Conversion to the sulfate form, easily soluble in water, is accomplished with pure acid reagents (1 or more reagent blanks always included for control). Details are included of procedures used, with which good recovery values (70% ± 6%) were obtained. A study is described in which brain tissue from autopsies were analyzed. Data concerning 6 of 20 brain areas studied are included, with the midbrain and occipital cortex of particular interest since they have shown the highest lithium. In the study of the brain of a manic-depressive case, a very high lithium content was found in midbrain. Although generalizations cannot be made from 1 study, the possibility that the manic-depressive may concentrate lithium in this brain area is of the greatest interest. It is concluded that the quantities of lithium found in the human brain are measurable, although its distribution is difficult to relate to "meaningful mechanisms or events."—P. McMillan.

2437. Wucherer-Huldenfeld, Augustinus. (1 Kreuzherrensasse, Vienna, Austria) **Was versteht Freud unter Religion?** [What does Freud understand concerning religion?] *Jahrbuch für Psychologie, Psychotherapie und*

medizinische Anthropologie, 1967, Vol. 15(3-4), 209-216.—Presents a brief commentary on Freud's attitudes concerning religious precepts.

2438. Yeomans, Neville T., Clark, Alfred W., Cockett, Margaret, & Gee, Kerry M. **Measurement of conflicting communications in social networks.** *British Journal of Social & Clinical Psychology*, 1970(Sep), Vol. 9(3), 275-281.—Developed a brief self-report scale, on the basis of double-bind theory and related formulations, to measure the amount of conflicting communications in social networks. The scale was given to 114 psychiatric patients, of mixed diagnoses, and to 97 normals. It discriminated successfully between these groups, patients' networks being characterized by significantly greater perceived conflicting communications than normals' networks. Results support the hypothesis that there is an association between conflicting communications and psychopathology. (17 ref.)—*Journal summary*.

PERSONNEL

2441. Bergen, Bernard J., Weiss, Robert J., Sanborn, Charlotte J., & Solow, Charles. (Dartmouth Coll., Medical School) **Experts and clients: The problem of structural strain in psychiatric consultations.** *Diseases of the Nervous System*, 1970(Jun), Vol. 31(6), 396-402.—Discusses the dynamics of the tension often existing in the working relationship between community physician and psychiatrist. An experimental demonstration project is described in which 17 physicians in various specialties in a rural town had psychiatric consultation available on a 24 hr., 7 day/wk basis via a 2-way television circuit linking the local hospital and the department of psychiatry of the mental health center. From interviews with community physicians it became evident that a chief reason for tension was the problem of professional status. Physicians expressed dissatisfaction over the fact that psychiatrists seldom sent a written report to the referring physician after seeing the patient referred. This fact was perceived as indicating an attitude by the psychiatrist of "expert to client" instead of colleague to colleague. The problem then became one of how 1 member of a profession can "seek help from another about something of which he is ignorant without losing his professional demeanor." Tentative solutions are discussed in terms of research into the underlying reality of this relationship as being 1 between 2 people and not between 2 professionals. (19 ref.)—*P. McMillan*.

2442. Black, Kathleen M. (State U. New York, Binghamton) **Teaching family process and intervention.** *Nursing Outlook*, 1970(Jun), Vol. 18(6), 54-58.—Describes the design and effects of a graduate course in psychiatric mental health nursing. The course, a practicum with families, is designed to promote "understanding of the family as an interacting unit," and to develop the basic skills necessary for aiding families in

need of assistance. The theoretical groundwork of the course involves key concepts from the fields of family process therapy, crisis intervention, and the sociology and anthropology of the family. A variety of examples are provided to illustrate the problems encountered by students in family situations, and the subsequent change in their orientation. It is concluded that "as clinical specialists of the future, these nurses may be expected to approach the nursing process in a way that will be more supportive and therapeutic as a result of having had this experience."—*R. Wiltz*.

2443. Brown, Robert D. (U. Nebraska, Counseling Service) **Experienced and inexperienced counselors' first impressions of clients and case outcomes: Are first impressions lasting?** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 550-558.—Investigated whether or not counselors' 1st interview impressions were related to case outcomes among experienced and inexperienced counselors. 1st-impression variables included intensity of client concern, client physical attractiveness, ease with which the client expressed himself, assessment of the client's potential for change, and the counselor's personal liking for the client. Some variables were significantly related to the number of counseling sessions, the type of termination, counselor satisfaction with his techniques and client progress at termination, and counselor perception of client satisfaction. The pattern of relationships was somewhat different for experienced and inexperienced counselors. The latter were more favorable in their 1st interview impressions and were more satisfied with counseling outcomes. Results suggest that counselor 1st impressions, i.e., personal liking, are related to selected outcomes and should be considered in making counselor-client assignments. (15 ref.)—*Journal abstract*.

2444. Chournos, George R. (Utah State U.) **Pre-training reactions to a recorded interview as a means of screening counselor trainees.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5685.

2445. Dörken, Herbert. (Dept. of Mental Hygiene, Bureau of Research, Sacramento, Calif.) **Utilization of psychologists in positions of responsibility in public mental health programs: A national survey.** *American Psychologist*, 1970(Oct), Vol. 25(10), 953-958.—Describes a 1969 survey of mental health programs in all 50 states. To document current status and provide precedence data, the survey sought information concerning positions including these at a divisional level within state programs and as program director of community mental health centers. 1/2 the states had psychologists as divisional chiefs, while in 75% of the states, the principle of competence in the appointment of local community mental health program directors was formally recognized.—*Author abstract*.

2446. Edelweis, M. L. **Die schlechten Beziehung unter Analytikern: Ein therapeutisches Problem?** [Poor relationships between analysts: A therapeutic problem?] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 289-297.—Discusses problems in relationships between analysts in both social and therapeutic situations. The analyst who is undergoing analysis is seen to have a built-in professional facade which is resistant to transference and to reliving regressive experiences.—*B. A. Stanton*.

2447. Engelkes, James R. & Roberts, Ralph R. (Michigan State U.) **Rehabilitation counselor's level**

of training and job performance. *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 522-526.—Investigated the effect of different levels of academic training on the job performance of rehabilitation counselors. 2 criteria of job performance were used: supervisor's ($N = 53$) global ratings of the job performance of counselors ($N = 209$), and clients' ($N = 1502$) reports of satisfaction with their counselors. A separate simple randomized analysis of covariance was used for each criterion holding experience constant in each case. Results indicate insufficient evidence to show any training effect for 4 different levels of training (trained, somewhat trained, minimally trained, and untrained) of rehabilitation counselors working for state rehabilitation agencies when rated either by their supervisor or their successfully rehabilitated clients. (16 ref.)—*Journal abstract*.

2448. Grünewald, Eduard. (27 Museumstr., Innsbruck, Austria) **Zur Psychohygiene des Psychoanalytikers.** [The psychohygiene of psychoanalysts.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 193-199.—Briefly discusses some of the problems involved in the process of psychoanalysis of analysts. It is noted that success or failure of the analyst-patient dialogue frequently depends upon the psychohygiene of the analyst.—*B. A. Stanton*.

2449. Kausch, Donald F. (Bowling Green State U., Psychological Services Center) **Medical students' attitudes toward the mental health field: A longitudinal study.** *Journal of Medical Education*, 1969(Nov), Vol. 44(11), 1051-1055.—Assessed attitudes of 64 medical students toward concepts used in the field of mental health by means of a semantic differential scaling procedure administered at the beginning of medical school and during their 4th yr. while on clinical clerkships. At the time of reassessment, 33 Ss had already received psychiatric clerkship experience (postpsychiatry), while 24 had not (prepsychiatry). During the 4th yr., attitude scores related to treatment procedures and specialists were significantly lower than the initial scores. No major differences were found between the pre- and postpsychiatry groups with respect to mean scores, although the postpsychiatry group tended to be more homogeneous in their ratings. Results are interpreted as supporting L. D. Eron's findings that a factor of cynicism increases as students progress through the 4-yr medical curriculum. The possibility that present educational methods may help produce this cynicism is discussed.—*Journal summary*.

2450. Lennon, Peter F. (Duquesne U.) **The experience of role conflict in priest-therapists.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5524-5525.

2451. Matarazzo, Joseph D. (U. Oregon, Medical School) **A national mental health manpower showcase conference: NAMH leads the way.** *Mental Hygiene*, 1970(Jul), Vol. 54(3), 333-336.—Presents a condensed narrative of organizational effort over a 3-yr period to solve the manpower shortage. The primary purpose of the resulting 1970 conference held in Washington, D. C. was to: (a) demonstrate new uses of existing mental health manpower, new categories of mental health manpower, new mental health workers, and new sources of mental health manpower; (b) stimulate expansion of new uses of human resources; and (c) alert and demonstrate to mental health asso-

ciations their potential leadership role in these areas. A National Follow-up Task Force was appointed.—*A. M. Cawley*.

2452. O'Donnell, Edward J. (Catholic U. of America, National Catholic School of Social Services) **The professional volunteer versus the volunteer professional.** *Community Mental Health Journal*, 1970(Jun), Vol. 6(3), 236-245.—Reviews partial findings of an empirical study relating to the differential perceptions laymen and professionals have of each other. Differences are explained according to professional norms associated with clinical and/or community organizational practice. The impact of these differences on the voluntary organizations in which they are involved is discussed together with the position afforded professionals in different communities. The potential for professional power-wielding in community voluntary organizations is described.—*Journal abstract*.

2453. Perske, Robert. (Menninger Foundation, Topeka, Kan.) **The gap between the mentally retarded and the pastor: A case study of the gap between ministry and people.** *Journal of Pastoral Care*, 1968(Sep), Vol. 22(3), 160-167.—Investigated the relationship between clergy and mental retardates to elucidate the tendency of a minister to maintain psychological distance with people. Possible reasons for the exacerbation of this tendency in dealing with retardates are: (a) desire for stimulating relationships, (b) fear of failure or insignificance, (c) myths about human progress, (d) testing the feeling of omnipotence, (e) belief in retardation as a result of evil, (f) security, and (g) lack of patience. Ability to terminate, express negative feelings, set realistic limits, understand nonverbal communication, develop charisma, and deal with the pendulum effect, contribute to the effective handling of this tendency by clergymen. Several case studies are presented.—*G. Steele*.

2454. Rechenberger, Heinz G. (11 Hugo Preuss Str., Rheydt/Giesenkirchen, W. Germany) **Psychotherapeutische Fortbildung.** [Further education in psychotherapy.] *Praxis der Psychotherapie*, 1969(Jan), Vol. 14(1), 63-65.—Criticizes the lack of unity and guidelines in the educational preparation of psychotherapists. The need for purview of new literature pertaining to psychotherapy is emphasized. Recommends frequent rereading of Freud's works and attendance at seminars related to psychotherapy.—*B. A. Stanton*.

2455. Ruff, George E. (U. Pennsylvania, Medical School) **Psychophysiological responses in clinical practice.** *Diseases of the Nervous System*, 1970(Jun), Vol. 31(6), 415-421.—Discusses 3 phases in the development of psychophysiological knowledge in medical practice: (a) the link of emotional stress to the onset of physical illness, (b) psychoanalytic formulations in psychophysiology, and (c) experimental psychophysiology. Pertinent literature illustrating each phase is cited, with an emphasis on the formulations of F. Dunbar, F. Alexander, and T. Lidz for the psychoanalytic phase. The research of A. F. Ax, H. W. Magoun, H. Selye, and J. I. Lacey is emphasized as illustrative of the last phase. It is concluded that the findings of psychophysiology are of more long-range interest for understanding mechanisms of psychosomatic interactions than of practical immediate assistance to the physician in his work with patients. (27 ref.)—*P. McMillan*.

2456. Simon, John L. (Box 6102, Santurce, Puerto Rico) **The psychiatrist's role in personal injury**

adjudication. *Diseases of the Nervous System*, 1970(May), Vol. 31(5), 329-332.—Reviews professional and ethical problems associated with the psychiatrist's difficult role as a "kind of universal arbiter" in personal injury cases referred to him by other medical specialists. Special problems associated with patients with suspected or actual mental disorder are discussed. Cases of possible malingering are also considered, including the question of how much detail to include in a consultation report.—P. McMillan.

2457. Wolcott, Oliver. (Denver Dept. of Health & Hosp., Colo.) **Function of mental health aides in a psychiatric clinic.** *International Journal of Social Psychiatry*, 1969(Fall), Vol. 15(4), 302-306.—Discusses the employment of sub- or nonprofessional workers in a Neighborhood Health Center in a very poor area of Denver. Aides were chosen from among the unemployed poor and were then given intensive practical training with continuous personal support whenever needed. Experience over 22 mo. shows that aides can work well on an outpatient psychiatric team.—M. B. Merk.

PSYCHOTHERAPY & ANALYSIS

2458. Bak, R. C. **Psychoanalysis today.** *Journal of the American Psychoanalytic Association*, 1970(Jan), Vol. 18(1), 3-23.—To rescue analytic time it is suggested that (a) a trial period be considered, (b) analysis be discontinued in the light of unfavorable evidence with as little loss of time as possible, (c) an adequate training program be established for auxiliary personnel for psychotherapy, (d) greater readiness be developed to recommend alternative forms of treatment, and (e) problems of analytic training and education be reconsidered with distinctions made between analysis as a therapy and analysis as a method of investigation. (26 ref.)—D. Prager.

2459. Beatty, Frank S. & Beatty, Jeanne M. (Mental Health Center of North Iowa, Mason City) **An evaluation of psychotherapy at a community mental health center.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 45-55.—An improvement rate of 63% was found among 148 patients undergoing psychotherapy from psychologists and psychiatric social workers at a non-urban community mental health center. The highest improvement rate (81%) occurred among patients staying in therapy 3-6 mo., although the majority of patients terminated before 3 mo. The attempt to provide a control group failed because applicants who did not enter therapy were found to be significantly different from applicants who entered therapy. It is suggested that "improvement without treatment" studies be attempted by comparing time elapsed between application and "improvement" for matched pairs of treated and untreated applicants.—*Journal summary.*

2460. Beck, Karl W. (Purdue U.) **The effects of psychotherapy on test responses.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5683.

2461. Blum, E. (Oberweg, Bern, Switzerland) **Anthropologie und Psychoanalyse.** [Anthropology and psychoanalysis.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 225-235.—Points out and discusses the common ontological basis of psychoanalysis and anthropology. The views of Binswanger and Szilasi are discussed in detail. (20 ref.)—B. A. Stanton.

2462. Boeke, P. E. (Rijksuniversiteit U., Groningen, Netherlands) **De praktijk van de psychotherapie door**

psychologen. [Psychotherapy as practiced by psychologists.] *Gawein*, 1968(Aug), Vol. 16(6), 315-324.—Since in all types of psychotherapy the therapist handles himself as an instrument, a training should precede the practice in every type of psychotherapy giving much attention to the technique and the conditions to use this technique, in addition to the theory.—*English summary.*

2463. Bruch, Hilde. (Baylor U., Medical School, Houston, Tex.) **Psychotherapy and eating disorders.** *International Psychiatry Clinics*, 1970, Vol. 7(1), 335-351.

2464. Bruno, Nelson & Duque, Rosa T. (Círculo Colombiano de Psicología Profunda, Bogotá, Colombia) **Kann die Gruppentherapie die Einzeltherapie ersetzen?** [Can group therapy replace individual therapy?] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 256-262.—Discusses criteria for the use of psychoanalysis in a group setting. The analyst is seen to become a part of the behavior of the group as a whole, thereby providing what is described as "group countertransference." Deep regression occurs in the form of a communal experience, and individual communication is reduced. On the basis of various therapeutic considerations, it is concluded that group psychoanalysis can replace individual psychoanalysis. However, the length of time required to achieve analytic goals increases with the group method.—B. A. Stanton.

2465. Cerdeño, A., Brugmann, A., & Suarez, A. **Besonderheiten der psycholytischen Technik im Vergleich mit der psychoanalytischen.** [Peculiarities of psycholytic techniques in comparison with psychoanalytic techniques.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 274-279.—Peculiarities of psycholytic techniques include (a) the use of drugs to maintain patient contact with reality, (b) forced confrontation of the patient with his social environment, and (c) early integration of behavioral changes into the patients ego. Potential dangers and difficulties involved are noted.—B. A. Stanton.

2466. Condrau, Glon. (770 Strehlgasse, Henliberg, Switzerland) **Das Leib-Seele-Problem im Lichte der Psychoanalyse.** [The body-soul problem in the light of psychoanalysis.] *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 30-39.—Psychoanalysis, largely oriented towards natural science and an empirical science itself, depends mainly on obtaining information from philosophy on the nature of man. However, it may make a contribution to the understanding of the interrelations of body and soul to the extent that not only mental illness but also organic troubles fall within its province. Previous thinking, based on subject/object divergence and oriented causally and genetically, had to give way to a phenomenological approach. Body and soul no longer appear as 2 separate entities. Decisive for any physical and mental illness is the basic attitude of man in which the openness or inaccessibility of his extraneous relationship is revealed.—*English summary.*

2467. Dimitrov, Christo T. & Krestnikov, Angel N. (Psychiatrische Universitätsklinik, Sofia, Bulgaria) **Einige Möglichkeiten zur Erweiterung und Bereicherung der Reproduktionsmethode von N. Krestnikoff.** [Several possibilities for further development and enrichment of N. Krestnikoff's reproduction method.] *Jahrbuch für Psychologie, Psychotherapie und medizinische*

Anthropologie, 1967, Vol. 15(3-4), 279-285.—Describes in detail the techniques of the reproduction method, a modification of psychocatharsis. Illustrative case material is presented to demonstrate the manner in which recall of psychotraumatic events is elicited. The method is compared with Tscholakow's method of "psycho-physiological decapsulation" in which hypnosis and suggestion are used to achieve catharsis. Suggestions are made for further application of the reproduction method.—B. A. Stanton.

2468. Graber, Gustav H. **Zur Analyse der geburts-traumatisch und total regressive bedingten Urwiderstände.** [Analysis of birth trauma and total regressive conditioned primary resistances.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 243-247.—Discusses the means by which primary regression can be recognized in the analytic situation. Intrauterine regression and birth trauma are an inseparable complex. Total defensiveness or total ambivalent pretensiveness are seen to be signs of primary regression. Therapeutic management is discussed using illustrative analytic case material. (28 ref.)—B. A. Stanton.

2469. Harrison, S. I. **Is psychoanalysis "our science"? Reflections on the scientific status of psychoanalysis.** *Journal of the American Psychoanalytic Association*, 1970(Jan), Vol. 18(1), 125-149.—There is the view that nothing tests the validity of analytic theory as convincingly as the analytic method. There is also a view that the validity of analytic theory is born of faith rather than observation. Committees of psychoanalysts should assess hypotheses, methodology, findings, and conclusions of experimental studies in an effort to clarify the relevance of the evidence for analytic theory. In psychoanalytic training there should be increasing emphasis on critical evaluation of data and method. (48 ref.)—D. Prager.

2470. Kernberg, O. F. **Factors in the psychoanalytic treatment of narcissistic personalities.** *Journal of the American Psychoanalytic Association*, 1970(Jan), Vol. 18(1), 51-85.—Proposes a general hypothesis regarding the etiology of the narcissistic personality structure, involving the relationships between pathological narcissism and pathological object relationships. Technical problems in the psychoanalytic treatment of narcissistic personalities are examined—especially their typical transference resistances—and prognostic criteria are outlined (21 ref.)—*Journal summary*.

2471. Lickint, K. (2 Vossstrasse, Heidelberg, W. Germany) **Der Empfang des Patienten und das Erstinterview in der psychiatrischen Klinik.** [The reception of patients and the initial interview in the psychiatric clinic.] *Nervenarzt*, 1968(Oct), Vol. 39(10), 451-456.—Reviews criteria for the doctor-patient relation in initial psychiatric interviews. Several samples of dialogue during initial interviews are presented to illustrate 2 main interviewing approaches: (the diagnostic and the psychotherapeutic). The advantages and disadvantages of both approaches are discussed. (15 ref.)—B. A. Stanton.

2472. Mentzel, Gerhard. (Kuranstalt Alpenblick, Neutrauburg, W. Germany) **Zur gezielten Kurztherapie bei funktionellen Erkrankungen.** [Goal-directed short-term therapy with functional disturbances.] *Zeitschrift für psychosomatische Medizin und Psychoanalyse*, 1969(Jan), Vol. 15(1), 37-44.—Describes successful experiences using a 6-wk short-term group

psychotherapy method in a mountain retreat clinic for patients having functional disturbances. Patients with psychosomatic conditions, vegetative syndrome, and vegetative dystonia responded well to treatment.—B. A. Stanton.

2473. Mizushima, Kellchi. [Image interview and its psychotherapeutic process.] *Japanese Journal of Clinical Psychology*, 1968(Jul), Vol. 7(2), 85-94.

2474. Neubauer, Vinzenz E. (1 Schubstr., Innsbruck, Austria) **Gedanken zur Identifikation und Übertragung.** [Thoughts concerning identification and transference.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 262-264.—Investigates the formation of the father and mother image and the mother image using an undefined sample of Ss from German factories and Tyrolean trade schools. Formation of and changes in identifications are compared with stages of psychosexual development. The influence of the father image on transference during psychotherapy is discussed.—B. A. Stanton.

2475. Noonan, J. Robert. (U. Georgia) **A note on an Eastern counterpart of Frankl's paradoxical intention.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 2(3-4), 147-149.—In the last 20 yr., Viktor Frankl's logotherapy has received much attention from mental health workers in the Western world. His procedures are considered particularly relevant to certain specified neurotic behaviors (e.g., insomnia). Morita therapy, an Eastern psychotherapy, is similar in many ways to Frankl's approach. 2 case study excerpts are presented comparing the 2 approaches. (15 ref.)—R. D. Nance.

2476. Papageorgiou, Michael G. (128 Solonos St., Athens, Greece) **Forms of psychotherapy in use in ancient Greece and among the population of modern Greece.** *Psychotherapy & Psychosomatics*, 1969, Vol. 17(2), 114-118.—Reports a method resembling psychoanalysis in the treatment by Melampus of Iphiclus' sexual impotency and the treatment in the sanctuaries of Aesculapius in Ancient Greece. The case of the Ancient tragedies (Aristotle's catharsis) may be considered as a form of group psychotherapy. Methods similar to behavior therapy among the population of modern Greece are mentioned.—*Journal abstract*.

2477. Schindler, Sepp. (111 Schönbrunner Str., Vienna, Austria) **Psychoanalytische Grundregel und Kommunikationsprobleme.** [Psychoanalytical principles and communication problems.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 221-224.—Discusses problems involved in communication during psychoanalysis (i.e., syntax, RT during free association, mutism, resistance, and contact disturbances). The importance of the affective connotation of words in psychoanalysis is emphasized.—B. A. Stanton.

2478. Schuld, W. John & Truax, Charles B. (U. Arkansas) **Variability of outcome in psychotherapeutic research.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 405-408.—Studied the generality of a conclusion that psychotherapy leads to a significantly greater increase in variability of posttest outcome measures within treatment groups than within control groups. Data from 5 research studies were analyzed for variance change from pre- to posttesting. Results suggest that, most commonly, therapy and control situations have little effect on changing variability in outcome measures.—*Journal abstract*.

2479. Schur, M. & Ritvo, L. B. A principle of evolutionary biology for psychoanalysis: Schneirla's evolutionary and developmental theory of biphasic processes underlying approach and withdrawal and Freud's unpleasure and pleasure principle. *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 422-439.—Freud's psychological formulations of the development of the mental apparatus and the unpleasure principle were based on neo-Lamarckian evolutionary theories and Fechner's constancy principle. Schneirla's theory provides a more satisfactory principle than Fechner's constancy principle or Freud's death instinct theory as the biological substratum Freud was seeking for his formulations of the regulatory principles of mental functioning. (27 ref.)—D. Prager.

2480. Shaked, Josef. Bemerkung über die individuellen und die sozialen Dimensionen der Psychoanalyse. [Remarks concerning the individual and the social dimensions of psychoanalysis.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 207-208.—Social dimensions of psychoanalysis should be based on the consideration that man and society are both products of their conflicts. Individuals must not be considered as the products of a society or definite culture; they should be thought of as miniature models of a society and culture. They are models in which many elements have been arranged in new patterns.—B. A. Stanton.

2481. Siegman, A. J. A note on the complexity surrounding a temporary use of denial. *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 372-378.—Denial of object loss and absence of grief and mourning are found after childhood. In an analysis of a young teen-ager, this denial was obscured by a shift of the original conflict between the ego and reality to a conflict between ego and superego. The secondary conflict in turn evoked evidences of and defenses against shame and guilt, as manifested particularly by "as-if" emotions and self-punitive acts and attitudes.—D. Prager.

2482. Skarbek, Andrew. (Langham Clinic of Psychotherapy, London, England) A psychophysiological study of breathing behaviour. *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 637-641.—Measured resting breathing rate (RBR) in 101 acute psychiatric patients to discover correlations between RBR and type of treatment and diagnosis. Clinical improvement was significantly associated with a mean decrease in RBR, and treatment with phenothiazines appeared to decrease RBR. ECS and to a lesser extent antidepressants appeared to increase RBR. There were no significant differences between diagnostic groups in change of RBR.—R. L. Sulzer.

2483. Spain, John L., Attkisson, C. Clifford, & Fine, Harold J. (U. Tennessee) "Never scold a little tin soldier": Case conceptualization in school phobia. *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 95-98.—Presents "an argument that it is necessary to treat both the overt symptomatic behavior and the prebehavioral organizational structures." An illustrative case is given.—H. K. Moore.

2484. Staabs, Gerdhild. (13 Richard-Strauss-Str., Berlin, W. Germany) Der Szenentest in der Psychoanalyse. [The Scene Test in psychoanalysis.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 286-289.—Discusses the application of the Scene Test (originally developed for

use in child psychotherapy) to adult psychoanalysis. The Scene Test has been demonstrated to be of use for activating repressed desires and tendencies in the extremely inhibited patient. It is also seen to intensify analysis and shorten treatment duration requirements.—B. A. Stanton.

2485. Tietz, Walter & Woods, Sherwyn M. (U. Southern California, Medical School) Alienation: A clinical view from multidisciplinary vantage points. *American Journal of Psychotherapy*, 1970(Apr), Vol. 25(2), 296-307.—Presents the alienation theme from a therapeutic viewpoint utilizing 4 theoretical positions, and reports 4 cases from each standpoint, the sociological, existential, psychodynamic, and theological aspects. The "intrapsychic, interpersonal and sociocultural determinants present in the individual clinical circumstance" must be considered for the successful application of 1 of the theoretical positions in therapy. It is concluded that 2 distinct forms of alienation exist: (a) the sociocultural alienation (anomy), and (b) the personal alienation of oneself from one's deeper feeling and real self. (20 ref.)—P. R. Shibelski.

Therapeutic Process

2486. Boesky, D. The reversal of déjà raconté. *Journal of the American Psychoanalytic Association*, 1969(Oct), Vol. 17(4), 1114-1141.—The reversal of déjà raconté occurs when a patient erroneously asserts that he has not already divulged something to the analyst. Clinical material is presented to demonstrate that this reversal is a transference resistance rooted in castration anxiety which is designed to repudiate degraded self-representations. (24 ref.)—Journal summary.

2487. Bondy, Stephen B. (Michigan State U.) Completed psychotherapies: An investigation of the communication of values, therapeutic outcome, and selected therapist variables. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5227.

2488. Close, Henry T. (Georgia Mental Health Inst., Atlanta) A meditation on dying. *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 66-69.—A therapist, knowing he is dying of leukemia, reveals his condition to a patient and the 2 are brought closer together.—H. K. Moore.

2489. Daniels, R. S. Some early manifestations of transference: Their implications for the first phase of psychoanalysis. *Journal of the American Psychoanalytic Association*, 1969(Oct), Vol. 17(4), 995-1014.—The analytic situation encourages the development of transferences and a repetition of the infantile neurosis in current form, the transference neurosis. The working or therapeutic alliance is fostered by comments offering preliminary demonstrations of the analytic method and its value. The case material presented is not helpful in answering technical questions about the effect of early deep transference interpretations. Defense against the transference and the defense transference are helpful concepts in ordering and understanding the phenomena of the first phase of analysis. (20 ref.)—D. Prager.

2490. Enke, Helmut. (U. Ulm, W. Germany) Soziale Bezüge: Über Relativität psychotherapeutischer Diagnostik durch soziale Rollen des Therapeuten. [Social relations: Relativity of psychotherapeutic diagnostics through social roles of therapists.] *Praxis der Psychotherapie*, 1969(Jan), Vol. 14(1), 18-27.—Discusses

the subjectivity on the part of therapists which influences the diagnosis and mode of treatment that the patient will receive. Forms of social relations between therapist are very briefly considered. Attention is focused on the role of the psychotherapist as a member of an elite minority group which projects universal pretensions, roles, and images.—*B. A. Stanton.*

2491. **Friedman, Lawrence.** *The therapeutic alliance.* *International Journal of Psycho-Analysis*, 1969(Apr), Vol. 50(2), 139-153.—Freud noted the therapeutic alliance paradox where the patient feels both helpful and unhelpful toward the analyst. This alliance signals that analytic objectives have been reached, i.e., the patient gives up living by the pleasure principle and develops sublimation. The alliance endows the patient with the analyst's needs. In the midst of discord the analyst must find agreement. As the discord between patient and analyst narrows, the patient starts to recover. This is the therapeutic alliance. If the analyst seeks this point as a fulcrum of treatment he will find only frustration. (26 ref.)—*J. Chyatte.*

2492. **Grayson, Henry.** (Brooklyn Coll., City U. New York) *Grief reactions to the relinquishing of unfulfilled wishes.* *American Journal of Psychotherapy*, 1970(Apr), Vol. 25(2), 287-295.—Inability to fulfill infantile and other hopes and dreams is seen to be related to the loss of an object or person, thus it is postulated that the grief which follows (necessary in the loss of an object for the decathexis of that object) is similarly important in this case. Most important in the grief process is the abreaction and catharsis of the lost hopes and dreams in order to facilitate this mourning process. Case studies are presented to demonstrate the process involved in this type of mourning.—*P. R. Shibelski.*

2493. **Hollender, Marc H. & Hersh, Stephen P.** (Vanderbilt U.) *Impossible consultation made possible.* *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 343-345.—Describes problems encountered when a psychiatrist is called upon as a consultant to see a patient suspected of "creating his own illness" (e.g., surreptitious ingestion of drugs). A case is reported of a 41-yr-old female patient in which the psychiatrist encouraged the referring physician to confront his patient with the facts before referring her for consultation. In this way the psychiatrist will not be perceived by the patient as a prosecutor or detective but as an ally. Possible objections to this approach are that the referring physician might be vindictive in the confrontation, and overlook a possible psychotic reaction in the patient.—*P. McMillan.*

2494. **Hurn, Hal T.** *Adolescent transference: A problem of the terminal phase of analysis.* *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 342-357.—Some incongruities in the literature pertaining to the terminal phase of analysis together with the author's experiences with his own case load and seminars on the terminal phase indicate that some relatively unappreciated complications of the terminal phase may be transferences from adolescence. Several brief vignettes and an extended case report are offered to support this contention together with a brief discussion. (15 ref.)—*Journal summary.*

2495. **Khan, M. Masud.** *On the clinical provision of frustrations, recognitions, and failures in the analytic situation.* *International Journal of Psycho-Analysis*, 1969(Apr), Vol. 50(2), 237-248.—This is an exposition of

Michael Balint's theories. He theorized that to understand the analytic situation one must analyze the analyst's behavior in that situation. The most important drug the doctor uses is himself. Classical theory is based on a biologic and pathologic framework. Balint wants to interpret the patient's transference in terms of object relations independent of the biological development theory of instincts. The analyst should avoid pushing the patient into a dependency state, avoid becoming a sharply contoured separate object, and avoid becoming omnipotent to the patient. (21 ref.)—*J. Chyatte.*

2496. **Klepac, Robert K.** (Kent State U.) *An experimental analogue of psychotherapy involving "client" behavior as a function of confirmation and disconfirmation of expectations of "therapist" directiveness.* *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5690-5691.

2497. **Kroth, Jerome A.** (Florida State U.) *An experimental investigation of free associative effectiveness as a function of posture: Implications for counseling.* *Dissertation Abstract International*, 1970(Jun), Vol. 30(12-A), 5239.

2498. **Páramo-Ortega, Raúl.** *Elnige Bemerkungen über das Schweigen des Analytikers.* [Several observations concerning the silence of analysts.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 247-252.—The silence of the analyst is the most important catalyst for free association by patients. Various patient reactions to the analyst's silence are discussed. Techniques involved and the therapeutic value of silence in relation to countertransference are described. (28 ref.)—*B. A. Stanton.*

2499. **Robertson, Mary & Barford, Frances.** (U. Florida) *Story-making in psychotherapy with a chronically ill child.* *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 104-107.—Stories written specifically for the hospitalized child reflect a release of the child's feelings and reinforce the therapeutic goal of getting well. A psychologist wrote stories which were read by the occupational therapist to chronically ill children to enable them to act out in fantasy those feelings they could not physically express.—*H. K. Moore.*

2500. **Rose, G. J.** *Transference birth fantasies and narcissism.* *Journal of the American Psychoanalytic Association*, 1969(Oct), Vol. 17(4), 1015-1029.—Over a 5-yr period, 9 cases were found to show patterns of unconscious birth fantasies centering around the end of the 9th mo. of treatment. Case examples are given of the various meanings of the birth fantasies. "Unconscious birth fantasies at the end of the 9th mo. of treatment might be viewed as accompaniments of thrusts toward individuation as well as defenses against regressive narcissistic fusion."—*D. Prager.*

2501. **Sandler, J., Dare, C., & Holder, A.** (Inst. of Psychiatry, London, England) *Basic psychoanalytic concepts: III. Transference.* *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 667-672.—Transference, a concept regarded by psychoanalysts as at the very center of their therapeutic technique, has rather different aspects emphasized by different schools, and has meanings than can only be appreciated in terms of historical development. Widening of the concept has occurred in attempts to understand human relationships in general. (26 ref.)—*R. L. Sulzer.*

2502. **Sandler, J., Holder, A., & Dare, C.** (Inst. of Psychiatry, London, England) *Basic psychoanalytic concepts: IV. Counter-transference.* *British Journal of*

Psychiatry, 1970(Jul), Vol. 117(536), 83-88.—Describes counter-transference as a concept that has generalized from Freud's original awareness of the patient's influence on the analyst's unconscious feelings to the present usage to describe the whole of the therapist's feelings and attitudes towards his patient. Counter-transference in the psychoanalytic literature is reviewed. Excluding general features of the analyst's personality, the most useful view of counter-transference may be to take it as referring to the specific emotional responses aroused in the analyst by the specific qualities of his patient. Monitoring and observation of counter-transference reactions may aid the doctor in a variety of clinical situations. (37 ref.)—R. L. Sulzer.

2503. Scher, Maryonda. (U. Washington, Medical School) **The process of changing therapists.** *American Journal of Psychotherapy*, 1970(Apr), Vol. 25(2), 278-286.—The change in therapists is regarded as a triangular situation between the patient, the departing therapist, and the new therapist. Rarely does this transitional period go without any noticeable problems, therefore the relationships between these 3 were examined in order to facilitate this change. Careful advanced preparation of patient and new therapist, enforcing old object losses in the patient, and observation on the part of the new therapist to subsequently fill the gap left by the previous therapist are some of the suggestions for the management of transfers. 2 case histories are presented to illustrate some "common therapeutic triangles found in hospitals, clinics, and related training programs."—P. R. Shibleski.

2504. Simon, J., et al. **Studies in audio-recorded psychoanalysis: II. The effect of recording upon the analyst.** *Journal of the American Psychoanalytic Association*, 1970(Jan), Vol. 18(1), 86-101.—Relates some problems of psychoanalytic research to the effect upon the analyst of audio-recording psychoanalytic sessions. Through a comparison with the supervised analytic situation and a consideration of the analyst's essential tasks, some of the authors' own and others' experiences in recorded analysis are reviewed. (46 ref.)—*Journal summary*.

2505. Spoerri, Theodor. (Psychiatrische U. Poliklinik, Bern, Switzerland) **Das Ausdrucksverhalten in der Arzt-Patient-Situation.** [Expression behavior in the doctor-patient relationship.] *Praxis der Psychotherapie*, 1969(Jan), Vol. 14(1), 41-47.—Discusses the importance of both verbal and nonverbal communication, in the form of facial expressions, respiratory rate, eye movements, laughter, etc. The need for acute perception of this behavior in the doctor-patient relationship is emphasized.—B. A. Stanton.

2506. Trenkel, Arthur. (47 Kramgasse, Bern, Switzerland) **Über "das Offene" der psychoanalytischen Situation.** [The "open-ended" psychoanalytic situation.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 252-255.—In the therapeutic domain, free associations represent the "unresisted whole" and are described by Heidegger as being "open-ended." The open-ended psychoanalytic situation is characterized by its lack of fixed analytic techniques. Its use is advocated for increasing verbalization on the part of the patient and increasing meaningful self-experience and insight.—B. A. Stanton.

2507. Wolman, Richard N. (U. Wisconsin, Medical School) **"Through the one-way mirror": An analysis of the dynamics in the observation of psychother-**

apy. *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 108-110.—There are several phases of the therapist-patient, therapist-Os-through-the-one-way-screen process, viz, Os' identification with the patient, Os' identification with the therapist, and Os' disengagement from selective identification.—H. K. Moore.

Group Therapy

2508. Bartoletti, Mario D. (York U., Toronto, Ontario, Canada) **Conjoint family therapy with clinic team in a shopping plaza.** *International Journal of Social Psychiatry*, 1969(Fal), Vol. 15(4), 250-257.—Presents a plan offering brief service to families and designed to reduce the waiting period between time of referral and the onset of treatment in order that effective psychotherapy can be provided at the time when the family is most ready to accept help and most likely to accept the structure within which help is to be provided.—M. B. Merk.

2509. Braen, Bernard B. (Syracuse U.) **The evolution of a therapeutic group approach to school-age pregnant girls.** *Adolescence*, 1970(Sum), Vol. 5(18), 171-186.—Describes 3 kinds of group therapy for teen-age pregnant girls.—A. B. Warren.

2510. Didato, Salvatore V. (Morton Prince Clinic, New York, N.Y.) **Delinquents in group therapy: Some new techniques.** *Adolescence*, 1970(Sum), Vol. 5(18), 207-222.—28 delinquents were seen in short-term group psychotherapy aimed at helping the boys make a successful transition from school, where they were having difficulty, to jobs in the community. (25 ref.)—A. B. Warren.

2511. Ferschtut, Guillermo. **Notas acerca de la mentalidad y el acting out grupales y de su Interpretación transferencial.** [On group mentality and acting out and their transferential interpretation.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Dec), Vol. 15(4), 324-333.—Relates concepts derived from individual psychoanalysis to group analysis, noting similarities and differences and considering the group as a "Gestalt." Particular attention is given to (a) polarity in group functioning (thought vs. acting-out, working-through vs. projective identification), (b) group identity, and (c) the value and character of transferential interpretation. (English summary) (21 ref.)—P. Hertzberg.

2512. Flomenhaft, Kalman; Kaplan, David M., & Langsley, Donald G. (U. Denver, School of Social Work) **Avoiding psychiatric hospitalization.** *Social Work*, 1969(Oct), Vol. 14(4), 38-45.—To compare results of outpatient family crisis therapy with hospitalization, a clinical team from a psychiatric hospital treated on an outpatient basis 186 patients considered acutely in need of admission to a psychiatric hospital. The control group consisted of 150 patients from the same population who were routinely hospitalized. In all except 3 of the initial 36 pilot cases, it was possible to avoid hospitalization. Tentative findings at 6-mo follow-up suggest that family crisis therapy has proved to be a more economical and less stigmatizing form of psychiatric treatment than hospitalization. Its principles are outlined, and the specific participation of the clinical social worker and his role on the crisis therapy team are described.—*Journal abstract*.

2513. Geller, Joseph J. **Die Verwendung der Grup-**

penpsychotherapie für analytische Langzeitbehandlung. [The use of group psychotherapy for long-term analytic treatment.] *Zeitschrift für psychosomatische Medizin und Psychoanalyse*, 1969(Jan), Vol. 15(1), 44-51.—Discusses the benefits derived from the use of analytically-oriented group psychotherapy, especially in conjunction with individual analysis. Patients having character neuroses, schizoid personalities, or schizoid defense mechanisms are seen to be particularly amenable to this form of treatment. Illustrative case material is presented. (15 ref.)—*B. A. Stanton.*

2514. **Illing, Hans A. & Miles, James E.** (Hacker Clinic, Beverly Hills, Calif.) **Outpatient group psychotherapy with sex offenders.** *International Journal of Social Psychiatry*, 1969(Fal), Vol. 15(4), 258-263.—Demonstrates that the major goal in dealing effectively with sex offenders on parole is "to assist them in bringing about changes in their antisocial behavior thus preventing further breaks with the law, and thus further prolonged incarceration." Group psychotherapy in an outpatient setting is discussed as 1 method of accomplishing this aim. Dialogue excerpts from 2 group meetings 1 yr. apart are presented to illustrate the characteristics of sex offenders, how they interact, and the degree of insight they can gain regarding each other's problems. It is stressed that, although patients increasingly look to the group for stability, there is much resistance and resentment, interpreted as negative transference feelings, which must repeatedly be dealt with. It is concluded that long-term group psychotherapy for sex offenders offers a promising approach which both continues surveillance at the community level and promotes modification of their antisocial behavior.—*M. Maney.*

2515. **Lievano, Jaime.** (221 Dawson Dr., Cockeysville, Md.) **Group psychotherapy with adolescents in an industrial school for delinquent boys.** *Adolescence*, 1970(Sum), Vol. 5(18), 231-252.—Presents an account of 42 sessions of group psychotherapy in which the dynamics, resistances, and insights gained are described.—*A. B. Warren.*

2516. **O'Connell, Walter E. & Hanson, Philip G.** (Veterans Administration Hosp., Houston, Tex.) **Patients' cognitive changes in human relations training.** *Journal of Individual Psychology*, 1970(May), Vol. 26(1), 57-63.—Pre- and posttraining data (N = 143 male patients) as reflected on Hartman's Personal Belief Inventory, revealed a significant reduction in negative beliefs about oneself and others. "Getting a patient to examine his life style by acting out his attitudes toward others and the world would seem to be an effective therapeutic approach."—*A. R. Howard.*

2517. **Reid, F. Theodore.** (Michael Reese Hosp., Inst. for Psychosomatic & Psychiatric Research & Training, Chicago, Ill.) **Impact of leader style on the functioning of a decision-making group.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 268-276.—Describes a study examining the functioning of 17 patient leaders in a task-oriented group in a mental hospital setting. Tape recorders equipped with numerical counters were used to record and rate group meetings. Data suggest that: (a) "in a task-oriented group, information gathering will exceed opinion sharing," which in turn will exceed decision making; (b) if the leader is inactive, the group will compensate by increased activity; (c) that a leader who becomes engrossed in his own ideas "will tend to impair the total leader-

group functioning;" and (d) that optimal functioning of task-oriented groups is related to the free expression of feelings by both leader and group members. Implications for leaders of nonpatient task-oriented groups are discussed.—*P. McMillan.*

2518. **Robinson, Margaret.** (Tavistock Clinic, London, England) **Family based therapy: Some thoughts on the family approach.** *British Journal of Psychiatric Social Work*, 1968(Fal), Vol. 9(4), 188-192.—Defining a family as "2 generations customarily living together," and therapy as "the process of being professionally involved in a helping relationship," some contemporary problems of family referral and diagnosis, criteria and definitions of family based therapy, and common problems encountered are considered. It is concluded that while the choice of treatment models is still imprecise and often guided more by tradition than family needs, progress in delineating various options can be reported.—*P. McMillan.*

2519. **Salas, E., Forti, L., Saimovici, E., & Sirota, A.** (U. Buenos Aires, Argentina) **Psicoterapia de grupo para niños y madres en situación de emergencia frente al tratamiento odontológico de los niños.** [Group therapy for children and mothers in emergency situations arising from dental treatment of the children.] *Revista de Psiquiatría y Psicología Médica*, 1969(Jan), Vol. 9(1), 16-38.—Describes an attempt at psychoanalytic treatment of children who refuse to submit to dental treatment. Therapy was done in groups, separately for mothers and their children. Transcripts and descriptions of the 1st 4 therapy sessions are presented. It is concluded that anxiety over dental treatment results from a confusion of the oral and genital areas. The confusion was observed in both play and verbal behavior. Clarifications made by the therapist led to the acceptance of dental treatment. The mothers began to realize their role in the conflicts of their children and were relieved of anxiety and guilt feelings. (English summary) (24 ref.)—*L. Zusne.*

2520. **Skytner, A. C.** (Queen Elizabeth Hosp. for Children, London, England) **Indications and contra-indications for conjoint family therapy.** *International Journal of Social Psychiatry*, 1969(Fal), Vol. 15(4), 245-249.—Discusses the advantages and disadvantages of conjoint family therapy with a group-analytic approach. Of the former, problem solving is kept within the family; there is economy of time and effort and also a widely variable degree of intervention. The main limitation of family therapy is that change is naturally restricted to what is acceptable to the family as a whole. Experience suggests that families who have reached the depressive position are not suitable.—*M. B. Merk.*

2521. **Snider, Richard T.** (U. Houston) **An exploratory factorial study of behavior interactions in autonomous patient groups.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5701-5702.

Behavior & Conditioning Therapy

2522. **Aikin, Paul A.** (Michigan State U.) **The effectiveness of a behavior oriented therapy and an insight oriented therapy on the academic achievement of "educationally-disadvantaged" students.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5681-5682.

2523. **Ardila, Rubén.** (National U., Bogotá, Colombia) **Psicología experimental e ingeniería del com-**

portamiento. [Experimental psychology and behavioral engineering.] *Revista Mexicana de Psicología*, 1970(May), Vol. 4(1), 8-15.—Behavioral engineering is defined as the application of operant conditioning to solving human clinical or educational problems; of major concern is the management of contingencies and the control of the stimulus situation. It is important to specify exactly the behavior one is looking for in order to shape behavior appropriately.—D. H. Schuster.

2524. Davison, Gerald C., Goldfried, Marvin R., & Krasner, Leonard. (State U. New York, Stony Brook) **A postdoctoral program in behavior modification: Theory and practice.** *American Psychologist*, 1970(Aug), Vol. 25(8), 767-772.—Describes a postdoctoral program in behavior modification which suggests that behavior therapy as an approach to clinical problems has more in common with experimental psychology than with other areas. A corollary of this position is a view of behavior modification as an applied general psychology, not limited by narrow views of conditioning therapy or by radical behavioristic constraints. A principal theme is that an academic setting provides the best opportunity for learning and thinking critically about this field. Specific features of the program as it now functions are detailed.—*Author abstract.*

2525. DiCaprio, Nicholas S. (John Carroll U.) **Essentials of verbal satiation therapy: A learning-theory-based behavior therapy.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 419-424.—Describes the rationale, methodology, and scope of a new form of psychotherapy, verbal satiation therapy. This therapy is based on the assumption that language symbols stand for real objects and events; in the absence of these stimuli, the verbal symbols may produce emotional responses normally associated with the objects themselves. The emotionally charged ideational content, having an advantage over more neutral content, obtrudes frequently into consciousness. Verbal satiation therapy attempts to reduce the emotional component of language symbols. Therapy consists of the use of satiation procedures, that is, verbal repetition, visual fixation, auditory exposure. With this form of treatment, critical language symbols are brought to a neutral level. Both unwanted negative and positive emotions may be dealt with by this form of psychotherapy.—*Journal abstract.*

2527. Franks, Cyril M. (Ed.) (New Jersey Neuropsychiatric Inst., Psychology Service & Research Center, Princeton) **Behavior therapy: Appraisal and status.** New York, N.Y.: McGraw-Hill, 1969. xxv, 730 p. \$15.—Presents a comprehensive overview of the field of behavioral therapy, including contributions by the foremost authorities covering techniques, philosophy, social aspects, experimental bases, and current issues.

2528. Kamil, Leonard J. (U. Texas) **Psychodynamic changes through systematic desensitization.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5689.

2529. Kanfer, Frederick H. (U. Cincinnati) **Self-monitoring: Methodological limitations and clinical applications.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 148-152.—Discusses some methodological, clinical, and theoretical issues in the use of self-observation raised in an experiment by R. M. McFall (see PA, Vol. 45: Issue 3). The difficulties in

ascertaining reliability of self-reports for events which have no external referents and the reactivity of self-monitoring limit the utility of self-observation as a control procedure in evaluating behavior therapy techniques. In clinical application, self-monitoring has been noted to modify behavior, but its controlling variables have not yet been explored. Self-observation is an initial step in self-directed behavior change. Therefore, its consideration is also required for conceptualization of self-regulatory processes, viewed as integration of response feedback utilization, self-control, and self-reinforcement, to attain self or externally prescribed performance standards. (42 ref.)—*Journal abstract.*

2530. Kuroda, Jitsuo. (Seiwa Women's Coll., Nishinomiya City, Japan) **Elimination of children's fears of animals by the method of experimental desensitization: An application of learning theory to child psychology.** *Psychologia: An International Journal of Psychology in the Orient.*, 1969(Dec), Vol. 12(3-4), 161-165.—3 experiments were performed. In Exp. I, elimination of fear of a frog combined desensitization and positive conditioning. Control and experimental groups differed at the .01 level. In Exp. II, elimination of fear of earthworms was obtained using gradual size increase. In Exp. III, elimination of fear of a cat was attempted by gradual approach. Control and experimental groups differed at the .05 level.—R. D. Nance.

2531. Lang, Peter J., Melamed, Barbara G., & Hart, James. (U. Wisconsin) **A psychophysiological analysis of fear modification using an automated desensitization procedure.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 220-234.—In Exp. I with 29 female undergraduates, an apparatus designed to administer systematic desensitization automatically was as effective as a live therapist in reducing phobic behavior, suggesting that effective desensitization is not dependent on a concurrent interpersonal interaction. An extensive psychophysiological analysis of the desensitization process showed that Ss' fear signals are associated with an increment in autonomic arousal, and that repeated presentation of fear items is accompanied by reduction in autonomic activity. Heart rate levels, responses, and degree of habituation to fear stimuli appeared related to success of desensitization. In Exp. II with 5 male and 15 female Ss, the anxiety hierarchies developed for desensitization yielded autonomic gradients, when the items were presented as visualized scenes, that varied with fear content and reported clarity of visualization. Results support the view that desensitization modifies autonomic, as well as gross motor and verbal responses, through learning.—*Journal abstract.*

2532. Lawson, David M. & May, Richard B. (McGill U., Montreal, Quebec, Canada) **Three procedures for the extinction of smoking behavior.** *Psychological Record*, 1970(Spr), Vol. 20(2), 151-157.—Employed 3 strategies of behavior modification, and a nondirective form of psychotherapy individually to determine each of their separate effects on the smoking behavior of 12 undergraduates. Although a significant ($p < .001$) overall reduction in Ss' cigarette consumption was observed, both the treatment effect and the interaction effect between treatments and trial wk. were statistically nonsignificant.—*Journal abstract.*

2533. Laxer, R. M. & Walker, Keith. **Counterconditioning versus relaxation in the desensitization of test anxiety.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 431-436.—Tested the

hypotheses that the efficacy of systematic desensitization could be attributed to a general reduction in anxiety as a result of relaxation training, to simple extinction of nonreinforced fear responses, or to the operation of placebo factors as alternatives to the counterconditioning hypothesis. 119 high-test-anxious high school students were divided randomly into 6 different conditions: systematic desensitization, relaxation alone, simulation alone, relaxation simulation, attention control, and no treatment control. Reduction in test anxiety was found only for Ss placed in conditions employing relaxation training. At least part of the effectiveness of systematic desensitization must be attributed to the effects of relaxation training.—*Journal abstract.*

2534. McConaghy, N. (U. New South Wales, Sydney, Australia) **Results of systematic desensitization with phobias re-examined.** *British Journal of Psychiatry*, 1970(Jul), Vol. 117(536), 89-92.—Past studies indicate a trend for $\frac{1}{2}$ the desensitized patients to show marked improvement vs. $\frac{1}{4}$ those treated with other therapies. The small samples used prevent statistically reliable differences although this trend favoring desensitization may be real and a valuable finding. It is suggested that patients with agoraphobia show a better response to behavior therapy than do those with more specific phobias. (15 ref.)—R. L. Sulzer.

2535. McLean, G. Donald & Graff, Robert W. (Southern Illinois U.) **Behavioral bibliotherapy: A simple home remedy for fears.** *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 118-119.—Describes an anxiety reduction technique in the form of a handout entitled "A Simple Home Remedy for Fears" which was based on a paper by N. Malleon and found effective with a college population. "The home remedy for fear is simply to experience the fear, deliberately and as fully as possible."—H. K. Moore.

2536. McReynolds, William T. (U. Texas) **Systematic desensitization, insight-oriented psychotherapy and relaxation therapy in a psychiatric population.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5694.

2537. Nerenberg, Arnold P. (U. Texas) **A comparison of systematic desensitization and another distraction method to increase tolerance for interpersonal silences.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5718.

2538. Nolan, J. Dennis & Pence, Connie. (Ohio State U.) **Operant conditioning principles in the treatment of a selectively mute child.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 265-268.—Reports the treatment of a 10-yr-old selectively mute girl. Over the course of 8 mo. of almost continuous contact, relatively normal speaking patterns were generated. At a 1-yr follow-up, her speech was indistinguishable from that of her classmates. She had improved even further in the "natural" environment and no new problems had developed.—*Journal abstract.*

2539. Prescott, James C. (U. Georgia) **The reduction of anxiety responses by relaxation and scene visualization until response onset or termination.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5696.

2540. Ramsay, R. W. & Barendregt, J. T. (U. Amsterdam, Lab. of Psychology, Netherlands) **Behaviour therapy: A brief introduction.** *Psychiatria, Neurologia, Neurochirurgia*, 1968(Sep), Vol. 71(5), 447-457.—Presents a brief introduction to behavior therapy

and describes the main techniques covered by the term behavior therapy. Some of the main criticisms of this approach are discussed, and some case histories are given to illustrate systematic desensitization and aversion therapy. (28 ref.)—*Journal summary.*

2541. Shank, Rowland W. (U. Georgia) **Anxiety reduction as preventive technique for experimentally induced stress.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5699.

2542. Smith, Ronald E. & Sharpe, Theodore M. (U. Washington) **Treatment of school phobia with implosive therapy.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 239-243.—Employed implosive therapy in the treatment of a 13-yr-old boy having a severe school phobia of some 60 days duration. Following the 1st session of implosive therapy, the S was able to return to school and attend his most anxiety-arousing class, and after 4 sessions, he returned to school on a full-time basis with no reported anxiety. Follow-up data revealed that the S not only had maintained his gains, but that he had also shown substantial improvement in school grades and peer relationships.—*Journal abstract.*

2543. Wolff, Richard & Perkins, Dan. (Peoria State Hosp., Ill.) **Contingency control and shaping procedures to institute bedmaking behaviors in a state mental hospital.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 320-321.—By making cigarette smoking for the day contingent on bed making, the number of unmade beds on a locked psychiatric ward of a state mental hospital was reduced from 50%-10%. Of Ss who did not make their beds, only 1 found cigarette smoking to be enjoyable. Successive approximations were used to institute bedmaking in that S.—*Journal abstract.*

Special & Adjunctive Therapy

2544. Fazio, Anthony F. (U. Wisconsin, Milwaukee) **Treatment components in implosive therapy.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 211-219.—In an effort to evaluate reality-testing and supportive aspects of implosive therapy (IT) independent of the anxiety-eliciting scenes, 73 and 93 female undergraduates with a fear of a specific insect were administered 3 sessions of 1 of 3 tape-recorded treatments. In 2 double-blind experiments, Ss treated with IT were not found to improve significantly as measured by repeated overt behavioral tests. In both studies, the reality-supportive discussions were associated with significantly greater reductions in phobic behaviors than IT. Findings are related to the theoretical formulations of IT and to treatment applications. (34 ref.)—*Journal abstract.*

2545. More, Joseph. (Rambam Hosp., Haifa, Israel) **Hypnoanalysis and analytic psychotherapy: A comparative study.** *British Journal of Psychiatry*, 1970(Jul), Vol. 117(536), 75-82.—Compared the process of analysis with and without hypnosis as an adjunct to reveal many shared qualities and no proof that hypnoanalysis offers any distinct advantage. It is possible that a working therapeutic contract, which is seen as the most important element determining the subsequent behavior of patient and therapist, may be better established using hypnosis, at least for some patient-therapist combinations. It is concluded that the goals of hypnosis in therapy can be achieved by alternate techniques in psychoanalysis and analytic psychotherapy, which is reasonable considering

the common evolution of these procedures from hypnotic therapy. (16 ref.)—R. L. Sulzer.

2546. Rhinard, Larry D. (Florida State U.) **A comparison of the effectiveness of nondirective play therapy and behavior modification approaches.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5696.

2547. Singer, Myron M. (Louisiana State U. & A & M Coll.) **The relationship of trait- and state-anxiety, overall fearfulness and suggestibility to the implosion of fear of rats.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5700-5701.

2548. Stoudenmire, John A. (U. Southern Mississippi) **Methodological variables in the reduction of state and trait anxiety using relaxation training.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5703.

Drug Therapy

2549. Abuzzahab, Faruk S. (U. Minnesota, Medical School) **Some uses of haloperidol in the treatment of psychiatric conditions.** *Psychosomatics*, 1970(May), Vol. 11(3), 188-193.—Conducted a 4-wk open investigation of haloperidol on 41 variously diagnosed 7-57 yr. old psychiatric patients, most of whom were schizophrenic, although 3 Ss with Huntington's chorea and 4 with Gilles de la Tourette syndrome were also included. Of the 31 Ss who completed the study, 3 showed marked improvement, 19 moderate improvement, 5 slight improvement, and 4 no change. Extrapyramidal side effects appeared in 24 patients and, with the exception of 4 cases, were adequately controlled by the concurrent administration of antiparkinsonian medication. It is concluded that haloperidol, found to be a rapid acting and nontoxic agent, is valuable in the treatment of a wide variety of psychiatric problems.—*Journal summary.*

2550. Angst, J., et al. (Psychiatrische Universitätsklinik, Zurich, Switzerland) **Lithium prophylaxis in recurrent affective disorders.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 604-614.—Presents data from clinics in Glostrup, Prague, and Zurich for 244 patients. Lithium treatment led to pronounced and statistically reliable reductions in the number of episodes of affective disorder and hospital admissions. All 3 clinics and each disorder, manic-depressive psychosis, recurrent depressive psychosis, and schizo-affective psychosis, showed the positive effect of lithium with the effect independent of age, sex, and previous frequency of episodes. Additional results showing the effects of lithium on prolongation of cycles and shortening of episodes provide strong evidence that lithium is an active prophylactic agent in recurrent affective disorders. (39 ref.)—*Journal summary.*

2551. Bordeleau, J. M., Charland, P., & Tetreault, L. (St. Jean-de-Dieu Hosp., Montreal, Quebec, Canada) **Hypnotic properties of nitrazepam (mogadon): A comparative study of chlordiazepoxide, diazepam, nitrazepam, secobarbital and placebo in psychiatric patients.** *Diseases of the Nervous System*, 1970(May), Vol. 31(5), 318-323.—Studied the relative hypnotic properties of 3 benzodiazepines, standard hypnotic, and a placebo in a double-blind study involving 64 18-60 yr. old patients. Behavioral effects of the drug were evaluated by a questionnaire completed daily after interviews with each S. Nitrazepam, like secobarbital, reduced the duration of sleep-induction and increased

the duration of sleep. Chlordiazepoxide and diazepam did not differ significantly from placebo by their action on these 2 parameters of sleep. Side effects were mild in all cases and medications were well tolerated, although at 50 mg., chlordiazepoxide had more side effects than placebo.—*Journal summary.*

2552. Brandsma, Maynard. (Leisure World Medical Center, Laguna Hills, Calif.) **Preliminary experience with medazepam (nobrium) in the management of psychophysiological reactions.** *Psychosomatics*, 1970(May), Vol. 11(3), 197-200.—Administered medazepam (nobrium) to 57 patients with psychiatric or functional somatic disorders in which anxiety-tension was a characteristic symptom. The daily dosage ranged from 10-60 mg. in divided doses, the usual dose being 15-40 mg. daily. Duration of treatment ranged from 3 days-17 wk., most Ss being treated for 6-8 wk. Results were favorable in 49 Ss, in 14 of whom symptoms completely disappeared. Side effects, mainly drowsiness, occurred in 10 Ss (transient in 5 who responded to adjustment of dosage, and necessitating discontinuation of medication in the others). Laboratory data for 17 Ss showed no abnormalities attributable to medazepam. Statistical analysis showed highly significant improvement ($p < .001$) due to medazepam in the major anxiety symptoms, average improvement score, and overall clinical status.—*Journal summary.*

2553. Canger, R. & Wahl, L. (U. Heidelberg, Nerven-klinik, W. Germany) **Die Behandlung der Epilepsie mit Maliasin.** [Treatment of epilepsy with maliasin.] *Nervenarzt*, 1968(Oct), Vol. 39(10), 476-478.—Describes results of clinical trials using maliasin in anticonvulsant treatment of 298 8-64 yr. old epileptic patients. 110 Ss who had previously had frequent grand mal seizures, remained asymptomatic on minimal oral doses of 300 mg/day. 30 additional Ss received subminimal doses, therefore making assessment invalid. Ss having psychomotor epilepsy exhibited no anticonvulsant response to the drug. No irreversible side effects were observed. 35 Ss developed mild side effects including anorexia, fatigue, weight gain, constipation, and irritability. Further trials are advocated.—B. A. Stanton.

2554. Chechel, A. P. (Medical Inst., L'vov, USSR) **Vliyaniye difenina na slizistuyu obolochku dësen.** [Influence of diphenine on the gingival mucosa.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 275-277.—Discusses complications in the gums and teeth resulting from the treatment of epilepsy with the anticonvulsant preparation, diphenine, based on observations of 74 6-59 yr. old patients. (English summary)—I. D. London.

2555. Diebold, K. & Ronge, J. (U. Heidelberg, Psychiatrische & Neurologische Klinik, W. Germany) **Ergebnisse, Kasuistik und Diskussionen über Polythymolepsie (kombinierte Anwendung von Thymoleptika) bei endogener Depression.** [Results, case histories, and discussions concerning polythymolepsy (combined use of thymoleptics) in endogenous depression.]—Discusses the combined use of novril (dibenzepin), tofranil (imipramine), melleril (thioridazine), and saroten (amitriptyline) in 10 31-62 yr. old patients who failed to respond to other forms of therapy for endogenous depressions. Full remission was effected in 5 cases, partial in 4 cases, and no remission in 1 case. No adverse reactions were observed, however, the drug combination is contraindicated for patients with circulatory or cardiac disorders and for the elderly. Specific

responses for each case are discussed. (40 ref.)—*B. A. Stanton.*

2556. **Gershon, Samuel.** (New York U., Medical School) **Psychopharmacology of the lithium ion: Twenty years after.** *Diseases of the Nervous System*, 1970(May), Vol. 31(5), 333-335.—Traces the course of development of the lithium ion following its introduction into psychiatry by J. F. Cade in 1949 to review its current clinical indications, treatment of manic episodes, and research possibilities. Occurrence of toxicity and death in the early use of lithium slowed its utilization in the treatment of affective disorders. It is felt that the lithium ion can be a prime research tool in psychopharmacology because it can be readily studied in fluids and tissues in humans and animals, and because of its long-term effectiveness in influencing the manic-depressive disorders. (15 ref.)—*P. McMillan.*

2557. **Grishilov, A. E.** (Provincial Psychiatric Hosp., Kursk, USSR) **K voprosu o diagnosticheskoy znachenii élektrokardiograficheskikh izmenenii u psikhicheskikh bol'nykh v period lecheniya insulinom.** [On the diagnostic significance of electrocardiographic changes in mental patients during insulin treatment.] *Zhurnal Nevropatologii i Psikhatrii*, 1970, Vol. 70(2), 267-270.—Presents an analysis of the EKGs of 1254 mental patients undergoing insulin treatment. The observed changes were not specific to insulin hypoglycemia because similar changes may be observed in other conditions as well, such as in organ lesions of the myocardium. In insulin treatment there were no clinical or biological indications of organic destruction of the myocardium. (English summary)—*J. D. London.*

2558. **Grof, P., et al.** (Psychiatrische Universitätsklinik, Zurich, Switzerland) **Methodological problems of prophylactic trials in recurrent affective disorders.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 599-603.—Presents 2 ways in which controlled prophylactic trials may be performed: concurrent comparison of the course of disease in an experimental patient group and a control group, and studies on a single group of patients during successive control and drug periods. Each procedure has advantages and disadvantages, and ethical problems are of importance. Definition of patient samples and the criteria chosen for recording a relapse are worthy of special attention. Consideration is due to nonpharmacological factors, i.e., spontaneous variation of the disease course, the psychological effects of the treatment, and O bias. (41 ref.)—*Journal summary.*

2559. **Gromov, S. A. & Sarykh, N. T.** (Bekhterev Psychoneurological Inst., Leningrad, USSR) **K izucheniyu mekhanizma deistviya i terapevticheskoi éffektivnosti éleniuma i duksen pri diéntséfal'noi épilepsii.** [On the mechanism of action and therapeutic effectiveness of elenium and duxen in diencephalic epilepsy.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Jan), Vol. 70(1), 122-125.—Mice, rats, guinea pigs, cats, and rabbits were used in a study of the pharmacological activity of elenium (librium), followed by a study of the therapeutic effectiveness of elenium and that of a preparation with analogous pharmacological properties, duxen (seduxen), in 117 18-55 yr. old patients with diencephalic epilepsy. Elenium had no clear adreno- or cholinolytic effects and could not prevent a diencephalic attack through action on the mediators of the autonomic nervous system (adrenaline, noradrenaline, acetylcholine). Elenium and duxen demonstrated high therapeutic

effectiveness with stable improvement attained in 83-85% of the Ss. Suspension of the use of these preparations brought about a renewal of the attacks. It is suggested that the therapeutic effect of these drugs derives from a possible interruption of pathological impulses in the deep regions of the brain (thalamus, limbic system, amygdaloid complex) without affecting the cortex and without acting on the source of pathological excitation. Details of the investigations into the pharmacological properties of elenium are presented, leading to the suggestion that the derivatives of 1,4-benzodiazepine be more widely used in treating diencephalic attacks and crises.—*J. D. London.*

2560. **Houck, John.** (Niagara County Mental Health Services, Niagara Falls, N.Y.) **Combined therapy in anxiety-depressive syndromes: II. Comparative effects of amitriptyline and Limbitrol (chlorthalidoxime-amitriptyline).** *Diseases of the Nervous System*, 1970(Jun), Vol. 31(6), 421-426.—Evaluated the comparative effectiveness of limbitrol (chlorthalidoxime, a minor tranquilizer, 5 mg. + amitriptyline, an antidepressant, 12.5 mg.) and amitriptyline (12.5 mg.) alone in a double-blind study with 49 neurotic outpatients with mixed anxiety-depressive reactions. Highly significant symptomatic improvement ($p < .001$) was demonstrated with both drug regimens at 1, 2, 3, and 5 wk. Analysis of data, however, showed the chlorthalidoxime-amitriptyline combination to be slightly but consistently more effective than amitriptyline alone even in the early phases of the study. As treatment continued, the superiority of the combined medication became more evident reaching statistical significance ($p < .01$) after 5 wk. particularly in regard to mood, somatic manifestations, total symptomatology, and drug efficacy ratings by Ss. Side effects were comparable on the 2 drug regimens and consisted most frequently of dry mouth, drowsiness, restlessness and excitement, and in a few cases, of constipation and gastrointestinal symptoms. They were generally mild and tended to disappear as treatment continued. Results indicate that neurotic patients with mixed anxiety-depressive reactions respond best to combined anti-anxiety-antidepressant medication. (15 ref.)—*Journal abstract.*

2561. **Kunca, David F.** (George Peabody Coll. for Teachers) **The effect of pharmacologically-induced arousal on novelty and complexity preferences of mentally retarded persons.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5691-5692.

2562. **Lichko, A. E. & Braverman, L. B.** (Psychiatric Hosp. No. 3, Leningrad, USSR) **Zatyazhnye (nekupiruemye glyukozoi) insulinovye komi, ikh prichina, klinika i lechenie.** [Protracted (not terminated by glucose) insulin comas, their cause, clinical picture and treatment.] *Zhurnal Nevropatologii i Psikhatrii*, 1970, Vol. 70(2), 270-274.—Presents an analysis of 23 cases of protracted insulin comas developing in the process of insulin therapy of psychoses. Indications and contraindications for the treatment of such comas at various stages are presented. The clinical picture of protracted comas can be differentiated from the usual hypoglycemic comas by the absence of excessive perspiration, the development of hyperthermia, and by signs of noncellular dehydration. The reason for lethal outcomes may be cerebral and subarachnoid hemorrhages during severe tonic convulsions. (English summary) (25 ref.)—*J. D. London.*

2563. **Matlina, E. Sh. & Osipova, M. S.** (Inst. of Child

& Adolescent Hygiene, Moscow, USSR) **Vliyanie aminazina na ékskretsiyu adrenalina, noradrenalina, dofamina i dofa u zdorovykh lyudei i pri maniakal'noi faze maniakal'no-depressivnogo psikhhoza.** [Influence of aminazine on excretion of adrenaline, noradrenaline, dopamine and DOPA in healthy people and in the manic phase of manic-depressive psychosis.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jan), Vol. 70(1), 128-131.—Presents data on the daily urinary excretion of catecholamines and DOPA (dihydroxyphenylalanine) under the influence of 50-mg aminazine (chlorpromazine) in 15 normal Ss and 11 manic-depressives in the manic phase of their psychosis. In normal Ss, 3 hr. after the administration of aminazine an increase in the excretion of adrenaline, dopamine, and DOPA appeared along with a decrease in that of noradrenaline; Ss in the manic phase of manic-depressive psychosis exhibited an increase in the excretion of adrenaline, noradrenaline, and DOPA 9 hr. after the administration of aminazine.—*I. D. London.*

2564. **Murphy, H. B.** (McGill U., Montreal, Quebec, Canada) **Ethnic variations in drug response: Results of an international survey.** *Transcultural Psychiatric Research*, 1969(Apr), Vol. 6, 5-23.—Reviews literature on neuroleptics in schizophrenia, personality traits and drug response, and ethnic differences between paradoxical and orthodox reactors as a basis for an international survey. Responses of an international group of psychiatrists who were asked to report any "possible ethnic differences in psychotropic drug response" support the hypothesis of cultural influence on reactions to psychotropic drugs. Evidence supports 2 types of influence: facilitatory and inhibitory. It is suggested that "the action of neuroleptics in Malaysians deserves further study." (22 ref.)—*G. Steele.*

2565. **Rastopchin, I. P.** (Provincial Psychiatric Hosp., Orenburg, USSR) **Opyt primeneniya pangamovoi kisloty (vitamin B₁₅) pri ateroskleroze sosudov golovnogo mozga s psikhicheskimi narusheniyami.** [An experiment in applying pangamic acid (vitamin B₁₅) in cerebrovascular atherosclerosis with mental disturbances.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 264-267.—Presents a clinical evaluation based on observations of 76 patients: 14 with atherosclerotic dementia, and 24 with asthenic, 20 with asthenodepressive, and 18 with hallucinatory-paranoid syndromes. Pangamic acid is a rather active preparation and may not only improve mental states, but also in some cases bring on an exacerbation of symptoms. Pangamic acid had a positive influence on asthenic and asthenodepressive states irrespective of the psychopathological syndrome within which they may be seen. Pangamic acid exerted a primary influence on mental manifestations due to cerebral hypoxia, but had no effect on symptoms reflecting destructive processes in brain tissue. (English summary)—*I. D. London.*

2566. **Rickels, Karl; Heschacher, Peter, & Downing, Robert W.** (U. Pennsylvania) **Differential drug effects in neurotic depression.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 468-475.—Divided 176 patients, treated for a 4-wk period with amitriptyline, chlordiazepoxide, placebo, or the drug combination of both active agents, into 4 subgroups according to their initial levels of depression and anxiety. Results indicate the drug combination to be most effective in the high depressed/high anxious subgroup, chlordiazepoxide in the low depressed/high anxious subgroup and amitripty-

tyline in the high depressed/low anxious subgroup. All agents, including placebo, were equally effective in the low depressed/low anxious group. These differences were not apparent when testing for main drug effects irrespective of initial level of anxiety and depression. In contrast to earlier studies, by dividing patients into 4 depressed subtypes, it was possible to separate not only the effects of the single antianxiety and antidepressant agents, but also the clinical effects produced by the drug combination from the effects produced by its single constituents.—*Journal summary.*

2567. **Rickels, Karl & Howard, Kay.** (University Hosp., Philadelphia, Pa.) **The Physician Questionnaire: A useful tool in psychiatric drug research.** *Psychopharmacologia*, 1970, Vol. 17(4), 338-344.—Discusses a 10-item Physician Questionnaire for rating neurotic symptomatology and presents the results of a factor analysis. The sensitivity of the 3 derived factor and 2 clinical cluster scores in detecting differences among psychotropic drug treatments was demonstrated.—*Journal abstract.*

2568. **Ross, Elizabeth K. & Priest, Robert C.** (U. Chicago) **The effect of hydroxyzine on phenothiazine therapy: A method of study.** *Diseases of the Nervous System*, 1970(Jun), Vol. 31(6), 412-414.—Assessed the possible potentiating effect of hydroxyzine (a minor tranquilizer) on phenothiazine (a major tranquilizer) in the treatment of 19 psychotic patients. Placebo and hydroxyzine were compared in a double-blind trial in addition to simultaneous phenothiazine therapy. Effects were assessed by the Hostility and Direction of Hostility Questionnaire, (51 items derived from the MMPI) administered independently. Results were the reverse of those expected, i.e., hydroxyzine minimized the effect of the phenothiazines ($p < .03$). Possible reasons for this result are discussed, including the role of occasional onset of depression during the course of hospital treatment.—*Journal summary.*

2569. **Schou, M., et al.** (Aarhus U., Risskov, Denmark) **Pharmacological and clinical problems of lithium prophylaxis.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 615-619.—While systematic use of lithium leads to improvement in recurrent affective disorders, there are some who do not respond. Treatment also may be accompanied by side effects, and in overdose serious intoxications may occur. Normal mental processes are little affected by lithium, but risks are sufficient to make it essential that the patients be motivated and well instructed, and that patients and doctors be prepared to observe the measures necessary for successful treatment. (33 ref.)—*R. L. Sulzer.*

2570. **Ucha Udabe, Ronaldo; López Molina, Amanda, & Niedermaier, Carmen.** **Nuevo tratamiento farmacológico del alcoholismo.** [New pharmacological treatment for alcoholism.] *Revista de Psiquiatria y Psicología Médica*, 1969(Jan), Vol. 9(1), 51-54.—A preliminary report on a 3-mo treatment of alcoholism in a group of 18 male and 12 female patients, 7 of whom were chronic (10-15 yr.) alcoholics, while the rest had histories of less than 2 yr. duration. The double-blind procedure was employed in administering a recently developed drug, metronidazole, which is said to decrease craving for alcohol. Patients were told that the medication was being given to improve the functioning of their livers. A dosage of 750 mg/day was used. At the end of the treatment period, 16 of the 20 patients who received the drug had abandoned the use of alcohol

completely. In 12 of these, anxiety level, as measured by an anxiety test, was also reduced. Of the 10 patients who received a placebo, only 1 improved. (17 ref.)—*L. Zusne.*

2571. Wittig, John & Coopwood, William E. **Lithium versus chlorpromazine for manics: Initiative and productivity versus tranquilization hospitalization.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 486-489.—Argues that lithium is "specific and superior for mania" and more useful than chlorpromazine in treating the manic depressive patient. 3 case histories are presented of patients who showed marked improvement when changed from chlorpromazine to lithium. It is felt that chlorpromazine usually succeeds in suppressing the more violent manifestations of mania, but has no specific effect on the fundamental mood change. Patients are "drugged rather than relieved of the manic symptoms." With lithium treatment, however, the patient "has no clouding of consciousness...and appears to have a normal degree of initiative and planning function." Reasons for resistance to the use of lithium are discussed, and it is suggested that posttreatment differences between the 2 drugs should be compared in patients through measures of initiative, mood, ability to plan daily activities, alertness, and attention. A rehabilitation program is suggested in conjunction with lithium treatment to enable the patient to use his new initiative productively and to recover from possible hospitalitis.—*P. McMillan.*

HOSPITAL CARE & INSTITUTIONALIZATION

2572. Bergen, Bernard J. & Thomas, Claudewell S. (Dartmouth Medical School) **An attempt to examine the perception of self and hospital among chronically ill mental patients.** *International Journal of Social Psychiatry*, 1969(Fal), Vol. 15(4), 307-313.—Investigated whether chronically ill mental patients significantly differ from newly admitted acute cases in dependency on and identification with the hospital. Ss were newly admitted patients, chronic patients hospitalized for 2 yr., and chronic patients hospitalized for 5 yr., with 10 males and 10 females in each group. Measures of dependency and identification with the hospital included: (a) interviews to determine Ss' feelings about returning to the community, helpfulness of the hospital, acceptance of his mental illness, and circumstances leading to hospitalization; (b) a modified TAT test; and (c) presentation of hypothetical dilemmas involving a choice between engaging or not engaging in a deviant act. Results indicate that: (a) although anxiety about returning to the community is characteristic of long-term hospitalized patients, it may be specific only to male chronic patients with females exhibiting this anxiety regardless of length of hospitalization; and (b) length of hospitalization may not have as great an effect on changing the self as is sometimes assumed. It is suggested that future research investigate how psychopathology and the sense of social self are related in terms of balancing potentials for rehabilitation and community treatment.—*M. Maney.*

2573. Brodsky, Carroll M. (U. California, Medical Center, Adult Psychiatry Clinic, San Francisco) **The culture of the small psychiatric unit in a general hospital.** *American Journal of Psychotherapy*, 1970(Apr), Vol. 25(2), 246-257.—Examines the problems, needs, unique patient/staff benefits innate in a hospital-based small psychiatric unit. Information compiled from one such unit and generalizations drawn from observation of

similar units throughout the country are presented. Some problems noted were that of staffing the unit, conflicting interests among the diversified points of view held by the staff, conflicts with the hospital's administration, etc. It was noted that on the whole, young psychiatrists, just having completed their residency, are usually chosen (more from necessity than desire) for the post of director. Frustration among residents in their work was similarly noted. Problems of having a closed- or open-ward policy also arose. Some of the advantages noted were that: (a) staff viewpoint diversity allowed for the use of varied therapies as opposed to a set continuum policy; (b) far less dissociation (on the part of the patient) with the outside world, implying less dependency upon ward life; and (c) more personalized treatment due to small size of ward. Under cultural analysis, these units are seen to resemble a type of "transient cultures" that "assume responsibility for the custody and rapid processing of people."—*P. R. Shibelski.*

2574. Hemprich, R. D. & Kisker, K. P. (U. Heidelberg, Psychiatrische & Neurologische Klinik, W. Germany) **Die "Herren der Klinik" und die Patienten: Erfahrungen aus der teilnehmend-verdeckten Beobachtung einer psychiatrischen Station.** [The "clinic men" and patients: Experiences with camouflaged observations of a psychiatric ward.] *Nervenarzt*, 1968(Oct), Vol. 39(10), 433-441.—Describes personal experience with a 6-wk observation via 1-way screen of the behavior of physicians, medical students, and ancillary personnel as therapeutic figures in a closed psychiatric ward. (22 ref.)—*B. A. Stanton.*

2575. Linn, Lawrence S. (U. Southern California, Medical School) **State hospital environment and rates of patient discharge.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 346-351.—Examined the relationship between hospital rates of patient discharge and the characteristics of 12 state hospital environments. Short-term hospitalization was found to be significantly correlated with small hospital size, high attendant-patient ratios, frequent and comprehensive staff-patient involvement in hospital activities, the frequency of normal activity observed on the wards, and the percentage of patients receiving visitors from outside the hospital. Data indicate that the quality of hospital living conditions defined by ward facilities or physical aesthetics, rules governing patients' behavior, and patients' age, mental status, or level of physical disability were not significantly correlated with length of hospitalization.—*Journal summary.*

2576. Muzekari, Louis H. (Philadelphia State Hosp., Pa.) **The therapeutic community and the mental institution: A new perspective.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 79-82.—Examines the nature of the therapeutic community as a system or subsystem within an organizational context and its role as an agent of change. 4 generic models of a therapeutic community are presented as a basis for the analysis and classification of existing therapeutic communities in relation to the total institution within which they function as well as the extramural community.—*Journal abstract.*

2577. Raphling, David L. & Lion, John. (Harvard Medical School, Boston, Mass.) **Patients with repeated admissions to a psychiatric emergency service.** *Community Mental Health Journal*, 1970(Aug), Vol. 6(4), 313-318.—Psychiatric emergency treatment units traditionally care for patients with acute psychosocial crises but are not ordinarily concerned with long-term follow-

up treatment. Nevertheless, a significant percentage of patients continue to request emergency treatment rather than becoming involved in durable treatment programs. These patients and their recurrent emergency treatment contacts are described. It is postulated that psychiatric treatment on an emergency basis may be an effective mode of treatment for patients prone to recurrent crises and unable to establish more stable treatment relations. (15 ref.)—*Journal abstract*.

2578. Ravensborg, Milton R. & Reyerson, Maurice. (Fergus Falls State Hosp., Minn.) **Discharge readiness: The similarity of social workers' and technicians' ratings of discharge criteria to a "community consensus."** *Community Mental Health Journal*, 1970(Jun), Vol. 6(3), 222-228.—Describes a discharge readiness questionnaire sent to 20 social workers and 80 technicians of a state psychiatric hospital, and to 7 community groups. Overall importance-ratings (mean weights on a scale from 1-3) assigned to scale items were compared among the 9 groups. It was found that hospital social workers ascribed less importance to patient behaviors as criteria for discharge than most other groups. However, technicians showed significant overlap with a community consensus (items weighted as very important by at least 4 out of 7 community groups) while hospital social workers did not.—*Journal abstract*.

PSYCHOANALYTIC INTERPRETATION

2579. Andreae, Stefan. (9 Kirchsteig, Innsbruck, Austria) **Über das Verhältnis von Traum und Realität und seine Bedeutung für die Traumdeutung.** [Concerning the circumstances of dream and reality and its meaning for dream interpretation.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 100-120.—Emphasizes the value of the dream as a key to knowledge of the unconscious. Dreams correlate grossly with reality as symbols of wish fulfillment. The fundamental difference between them is that our human experiences as well as feelings of real biological and intellectual needs are symbols of the anticipation of the consummation of all our wishes. (59 ref.)—*B. A. Stanton*.

2580. Bach, Helmut. (281 Clayallee, Berlin/Zehlendorf, W. Germany) **Die Ausreifung der menschlichen Aggressivität (am klinischen Beispiel Tetanie und Schizophrenie).** [The maturation of human aggressiveness: Clinical examples of tetany and schizophrenia.] *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 147-168.—Discusses the role of aggressiveness in 18 cases of neurogenic tetany, 6 cases of which underwent psychoanalysis for a total of 2500 hr. The aggressiveness in neurogenic tetany is seen to appear in the form of "runoff impulses," "break-off tendencies," and defense mechanisms. 7 schizophrenics who underwent a total of 4000 hr. of psychoanalysis demonstrated aggressiveness in the form of remissions, infantilism, and suicidal impulses. It is concluded that maturation of aggressiveness is directly related to and dependent upon ego maturation. (English summary) (28 ref.)—*B. A. Stanton*.

2581. Burkhardt, Hans. **Sinnlichkeit und Selbststege-wissheit.** [Sensuality and self-assurance.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 337-351.—Briefly discusses Freud's concept of libido. The problems of puberty entail the need to integrate eros and sex. Perceived

sensual feelings create a dualism within the individual which causes a conflict between society and sex. One defense against sensuality is "morbid rationalism" which causes estrangement of sensuality.—*B. A. Stanton*.

2582. Burt, Forrest D. (Texas A & M U.) **William Somerset Maugham: An Adlerian interpretation.** *Journal of Individual Psychology*, 1970(May), Vol. 26(1), 64-82.—The framework for this discussion includes the earliest memory, family constellation, inferiority feelings, style of life, social interest, and the tasks of life. (28 ref.)—*A. R. Howard*.

2583. Caruso, Igor A. (45 Lainzerstr., Vienna, Austria) **Aggressivität oder "Todestrieb?"** [Aggressivity or "death-drive?"] *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 105-121.—The death principle is seen to clearly manifest itself in the compulsion of repetition, but the compulsion of repetition is fundamentally ambivalent. Civilization carries with it manifestations of death, for it is originated as an answer to it. But its practice is not reduced to the utilization of the "death drive," but on the contrary, its return to the past is preformed under the signum of the "principle of Hope," and it is consecrated to the transcendent and progressive quality of eros. The psychoanalysis is based on the compulsion of repetition, but is based on the new quality of this phenomenon: about the "not yet" of the repetition, about the future and the "utopia" which are inherent to it.—*English summary*.

2584. Chasseguet-Smirgel, Janine. **Female sexuality: New psychoanalytic views.** Ann Arbor, Mich.: U. Michigan Press, 1970. viii, 220 p. \$8.95.—Presents articles by C. David, B. Grunberger, C. Luquet-Parat, J. Chasseguet-Smirgel, M. Torok, and J. McDougall which reexamine the theories of female sexuality using the Freudian approach to the unconscious.

2585. Gerpe, Marta & Valentini, Rodolfo. (735 Alvarez Thomas, Buenos Aires, Argentina) **Abwehr-mechanismen und Entfremdung.** [Defense mechanisms and alienation.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 266-274.—Reviews the Marxist concepts of work. The importance of alienation in relation to the nature and role of defense mechanisms is discussed. In his strivings for ego identity man is seen to develop defenses against nature and society. (24 ref.)—*B. A. Stanton*.

2586. Hawkins, David R. (U. Virginia, Medical School) **Psychoanalytic dream theory reexamined.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 233-240.

2587. Heigl-Evers, Annelise. (Niedersächsisches Landeskrankenhaus, Göttingen/Tiefenbrunn, W. Germany) **Rache als Gekränktheitsaggression.** [Revenge as aggression resulting from violation.] *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 182-198.—Examines the hostile reaction known as revenge and the neurotic character structure of the arrogant vindictive type as described by Karen Horney. On the basis of numerous case histories, it is demonstrated that neurotic revenge is an aggressive reaction to certain mortifications.—*English summary*.

2588. Holstijn, Westerman A. (10 Albrecht Durer-Str., Amsterdam, Holland) **Aggressivität, Todestrieb, Destruktionstrieb, Sadismus, Machtstreben.** [Aggressiveness, destruction instinct, sadism, death instinct, power instinct.] *Fortschritte der Psychoanalyse: Inter-*

nationales Jahrbuch zur Weiterentwicklung der Psychoanalyse, 1968, Vol. 3(3), 93-104.—Proposes that there is only 1 basic instinct, the life-instinct or eros-drive. The common conception of the word "aggressivity" is that of malicious aggressivity or destruction-drive. The original, neutral meaning of *adgredi* (to go toward) seems to be lost. The different forms of "aggressivity" are ways of defence, at the service of the life-instinct, by which we try to remove obstacles. Usually in psychoanalysis sadism is considered to be a mixture of sexuality and destruction drive. Sadomasochism, however, is an infantile form of libido-activity, in which, beside organic pleasure, a unity of S and O is pursued. It is illogical to call the physical entropy "death instinct" and to allege that it can be "turned outwards" into a drive to kill. This entropy may influence the psychic function. A tendency to stiffen in a fixed form is not aggressivity, at most "death-tendency"—Klages saw "the death of the soul" even in rational thinking. Only upon certain fixed forms, however, the development of mind as well as of life, can really progress. (German summary) (36 ref.)—*English summary*.

2589. Jones, Richard M. (State U. New York, Old Westbury) **The transformation of the stuff dreams are made of.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 221-227.

2590. Karon, Bertram P. (Michigan State U.) **An experimental study of parental castration fantasies.** *British Journal of Psychiatry*, 1970(Jul), Vol. 117(536), 69-73.—Examined 32 male Ss, with no history of psychiatric disorder and having both mother and father figures in childhood, with a modified Blacky technique, a TAT variant, to discover which parent was the castrator in their fantasies. While the classical fantasy of the father castrator was found, it appeared to be a defensive fantasy against the deeper, more frightening idea of the mother as the threatening castrator. This extends the previous finding with schizophrenic patients, indicating as suggested by Fairbairn and others that this constellation is characteristic of the general human condition. (19 ref.)—*Journal summary*.

2591. Levin, S. **Further comments on a common type of marital incompatibility.** *Journal of the American Psychoanalytic Association*, 1969(Oct), Vol. 17(4), 1097-1113.—In many instances a vicious circle of marital incompatibility results from a tendency on the part of the husband, when frustrated sexually by his wife to react by withdrawing from her and by developing an attitude of bitter grievance, which prevents a reconciliation. Some aspects of the sensitivity which underlies these reactions are discussed.—*Journal summary*.

2592. Lewis, Helen B. (State U. New York, Downstate Medical Center, Brooklyn) **The royal road to the unconscious: Changing conceptualizations of the dream.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 199-213.

2593. Lichtenstein, H. **Changing implications of the concept of psychosexual development: An inquiry concerning the validity of classical psychoanalytic assumptions concerning sexuality.** *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 300-318.—Clinical observations do not confirm a clear correlation between emotional maturity and ability to achieve genital orgasm. Sex is only 1 variable influencing human individuation. Sexuality is the earliest and most basic way to experience an affirmation of the reality of his existence. Suggestions concerning the

modification of the concept of genital primacy are introduced. (31 ref.)—*D. Prager*.

2594. Lipin, T. **Sensory irruptions and mental organization.** *Journal of the American Psychoanalytic Association*, 1969(Oct), Vol. 17(4), 1055-1073.—Irruptions into the inner world of sensory elements occur normally and pathologically. They are generated by the activity of repressed mental processes. This activity utilizes primary and secondary processes. Splitting off of organized functional segments occurs pathogenically as a part of the defensive process against trauma or unpleasure. The activity of the split-off portions of the mind may increase disturbances caused by pathological processes; it also may serve as an instrumentality of reparative processes and be a component of adaptive and creative functioning. (18 ref.)—*D. Prager*.

2595. Luparello, T. J. **Features of fugue: A unified hypothesis of regression.** *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 379-398.—A case presentation showing intense separation anxiety, close relationship between fugue and sleep, and suicidal and murderous impulses. These features are discussed in terms of current concepts of fugue states. A unified hypothesis of regression to an early phase of the mother-child relationship is proposed to account for such features. This regression hypothesis is an amplification of one proposed in 1956 by Geleerd. (15 ref.)—*D. Prager*.

2596. Marcovitz, E. **On the nature of addiction to cigarettes.** *Journal of the American Psychoanalytic Association*, 1969(Oct), Vol. 17(4), 1074-1096.—Heavy cigarette smoking is primarily a respiratory addiction consisting of the respiratory triad of inhalation-exhalation-visualization. It attempts the fulfillment of many unconscious purposes: delineation of inner boundaries and filling of emptiness of the chest, relief of fear of suffocation, gratification of respiratory erotism, respiratory introjection of a symbolic object with magic powers for the purpose of identification or mastery, and the projection by way of the exhaled smoke or onto it of the unconscious fantasy of the self. (27 ref.)—*D. Prager*.

2597. Noy, Pinchas. **A revision of the psychoanalytic theory of the primary process.** *International Journal of Psychoanalysis*, 1969(Apr), Vol. 50(2), 155-178.—Freud classified mental processes into primary (dominated by the pleasure principle) and secondary (dominated by the reality principle). A trend exists to widen the definition of primary process to include childhood, psychopathology, and dream thought processes. The original definition is adequate for clinical theory but inadequate in explaining creative activities. The 3 mechanisms of the primary process—displacement, condensation, and symbolism—need enlarging. The 2 processes are seen as a continuum, not as 2 different systems. The development of the primary process need not be limited to infantile stages. Its function need not be limited to disorganization and disintegration. Primary processes do not depend on feedback (consciousness) and are aimed at preserving self-integrations and are self-centered. Secondary processes are dependent on feedback and are reality oriented. (54 ref.)—*J. Chyatte*.

2598. Pollock, George H. (Inst. for Psychoanalysis, Chicago, Ill.) **Anniversary reactions, trauma and mourning.** *Psychoanalytic Quarterly*, 1970(Jul), Vol. 39(3), 347-371.—The concept of anniversary reactions (reactions which occur at the anniversary of a painful event in the patient's life, often on an unconscious basis)

is reviewed, "related to recent considerations of trauma, and specifically connected with unresolved mourning reactions resulting from significant losses. Clinical variations of these anniversary reactions are used to illustrate aspects of the theoretical propositions presented."—J. Z. Elias.

2599. **Pulver, S. E. Narcissism: The term and the concept.** *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 319-342.—Narcissism was used to denote a sexual perversion, a stage of development, a type of object choice, a mode of relating to the environment, and various aspects of self-esteem. Narcissism has not received sufficient elaboration in terms of ego psychology. (39 ref.)—D. Prager.

2600. **Reimann, Fritz.** (27 Oberföhringer Str., Munich, W. Germany) **Frühkindliche Formen der Aggression.** [Forms of aggression in early childhood.] *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 136-146.—Discusses aggression in relation to phases of psychosexual development. In the oral phase aggression is expressed in an intensive wish-force, cessation of detachment from the world, and the process of "taking in." The developmental objective is the establishment of the bond with the mother, and introjection is the dominant function. In the anal phase aggression is expressed in excretion and the creation of detachment and negation. Here repression is the dominant function, and the developmental objective is the assertion of independence and release from the maternal bond. In the phallic phase aggression is expressed in sexual rivalry, courtship, and conquest. The developmental objective is the gradual assumption of the sexual role, and identification is the dominant function.—*English summary.*

2601. **Ross, N. The primacy of genitality in the light of ego psychology: Introductory remarks.** *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 267-284.—Libidinal development and personality maturation are not dependent variables. Rich genital experiences of neurotics may be accounted for in terms of the existence of transitory fusions of early pregenital forms of tenderness with genital orgasm and/or especially rich constitutional libidinal endowments of relatively autonomous nature. Psychoanalysis cannot yet explain the unsatisfactory, nonorgastic sex life of more mature people. (55 ref.)—D. Prager.

2602. **Rothschild, Friedrich S.** (3 Redak Rd., Jerusalem, Israel) **Das Ich und das Gehirn.** [The ego and the brain.] *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 53-68.—In a survey of the evolution of intraorganismic sign systems the lawfulness is exposed which dominates the relation also between ego and brain. Essential conceptions of Freud's are argued from the viewpoint of biosemiotics, confirming issues, i.e., the relationships between the 3 qualities of psychical processes (unconscious, preconscious, and conscious), primary and secondary processes, developmental stages of childhood, and the role of defense against conflict in the predisposition of the ego towards health or disease. (16 ref.)—*English summary.*

2603. **Sarlin, C. N. The current status of the concept of genital primacy.** *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 285-289.—Discoveries making revision of the concept of genital primacy and the genital phase advisable fall into

4 interrelated categories: recognition of the equal importance of the aggressive drive in psychosexual development, focus on the earliest pregenital and preoedipal factors in the psychosexual development of character, greater understanding of ego functions and mechanisms, and increased knowledge of female psychosexual development. (25 ref.)—D. Prager.

2604. **Schlesinger, H. J. The place of forgetting in memory functioning.** *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 358-371.—Rather than the enemy of memory; repression can be viewed as a special form of memory, while forgetting, rather than the apparent opposite of memory, is a necessary result of the reorganizing of the working memory in the service of adaptation.—*Journal summary.*

2605. **Shapiro, T. Interpretation and naming.** *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 399-421.—The interpretation of an unconscious fantasy is the first step prior to working-through. A linguistic model is presented to describe the vicissitudes of verbal representation according to what is known about the development of reference. In this way disparate data on the interpretative process are brought together under the single heading called the "ego function of language." 6 clinical examples are given. In all instances the defects in verbal grasp can be viewed according to our understanding of the developmental faults in structuring language. (60 ref.)—D. Prager.

2606. **Silverman, L. H. Further experimental studies of dynamic propositions in psychoanalysis: On the function and meaning of regressive thinking.** *Journal of the American Psychoanalytic Association*, 1970(Jan), Vol. 18(1), 102-124.—Drive-related and neutral stimuli are presented subliminally and effects are observed on ego functioning and symptomatology. When a drive-related stimulus registers subliminally, it contacts congruent drive derivatives and stimulates unconscious conflict or it gets momentarily resolved. In the current work a series of experiments were conducted to provide an understanding of regressive thinking. Clinical and theoretical implications of the results are discussed. (40 ref.)—D. Prager.

2607. **Skinner, James C.** (Boston U., Medical School) **The dream in psychoanalytic practice.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 213-220.

2608. **Slochower, H. Psychoanalytic distinction between myth and mythopoesis.** *Journal of the American Psychoanalytic Association*, 1970(Jan), Vol. 18(1), 150-164.—Mythopoesis exemplifies the process of a change in function in its relation to mythology. What in mythology is a defense against drives develops here a degree of autonomy, which can set a goal in its own right with the hero participating in the labor to transform the old tradition. Mythopoesis takes the step by which magical and religious reality is transformed into symbolic and psychological reality. The function of the old mythology is not eliminated. This change of function renders the hero in mythopoesis at once tragically guilty and redeemable. (36 ref.)—D. Prager.

2609. **Spanijaard, Jacob. The manifest dream content and its significance for the interpretation of dreams.** *International Journal of Psycho-Analysis*, 1969(Apr), Vol. 50(2), 221-235.—Freud's views of manifest dream content never underwent reformulation or revision. Manifest dream content has a subjectively conflictual aspect which can be used for interpretation.

Freud warns against taking the manifest dream content seriously except perhaps the "undisguised wishful dreams." No technique of latent dream interpretation is evident in Freud's works. "Take all of the associations the patient reveals about the dream and himself and view these against the manifest dream background to interpret the dream.... The role of the dreamer in the dream itself is important to the interpretation of the current conflict." (113 ref.)—J. Chyatte.

2610. Spiegel, Rose. (350 Central Park W., New York, N.Y.) **A spectrum of varieties of violence toward understanding the violent individual.** *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 122-135.—The essential distinctions used so far in assessing violence hinge on the criterion of impulsivity vs. premeditation. This is seen to be too limited to subsume many other important phenomena of violence. An attempt is made to: (a) formulate a constellation of parameters or elements which apply to violence and which would serve to distinguish varieties in it; and (b) work out, on this basis, an orderly categorization which will increase the understanding of violence of different persons and be of practical use. (German summary) (21 ref.)—*Journal summary*.

2611. Streich, Hildemarie. (38 Preussenallee, Berlin, W. Germany) **Über die Symbolik der Musik: Ein Beitrag zur Interpretation musikalischer Motive im Traumgeschehen.** [The symbolism of music: A contribution to the interpretation of musical motives in dreams.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 120-133.—Briefly reviews the position held by music in Greek mythology and during the Middle Ages. Special meaning is ascribed to dreams having musical content. Frequently, dreams with musical content depict new phases of inner development. Musical harmony in dreams symbolizes totality of self. Case histories are presented to demonstrate how symbolic musical dream content may be used as a means of evaluating progress during psychoanalysis. Observations are made on symbolism accorded to various musical instruments (i.e., the flute and trumpet).—B. A. Stanton.

2612. Tenzler, Johannes. (12 Freiherrnstr., Weichs über Dachau, W. Germany) **Lebenswende und Individuationsprozess.** [Change of life and the individuation process.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 313-337.—Emphasizes the influence exerted by cultural factors, early personality development, ego strength, identity, and religious beliefs on attitudes towards acceptance and the change of life during middle age. Jung's views regarding the psychology of aging are summarized. (161 ref.)—B. A. Stanton.

2613. Wegeler, Adalbert. (5/12 Otto-Bauer-Gasse, Vienna, Austria) **Bemerkungen zu Ideologie und Rationalisierung.** [Remarks concerning ideology and rationalization.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 235-243.—An ideology used as a systematization of ideas and values is used by both the individual and the group as a rationalization. In the group it serves to provide structure and security. Ontogenetically, an ideology assumes the role of an ego ideal substitute. The manner in which the dialectic play between the group situation and the individual can foster self-understanding is demonstrated.—B. A. Stanton.

2614. Wollheim, Richard. **The mind and the mind's image of itself.** *International Journal of Psycho-Analysis*, 1969(Apr), Vol. 50(2), 209-220.—Reports of mental states presuppose a conception of mind itself. It is also assumed that every mental state is connected to a thought. Thoughts are passive (it just occurred to me) and active (we think thoughts). Freud's theory of thoughts originating in an attempt to avoid frustration and Klein's distinction between inner thought and the external object are introduced with the idea of pointing out that the conception of mind involves spatiality. If it is spatial, one must do more than attribute the mind with thoughts of 3-dimensional objects. For this, it is suggested that "either we should have some specific view about mental states assigning them an extended or quasi-extended character or else have some specific view about the relations in which objects of mental states stand to the mind, assigning to this a positional character." We are at home in our mind and this is the mind's image of itself. But is this a correct image? (33 ref.)—J. Chyatte.

2615. Zetzel, Elizabeth R. (Harvard Medical School, Boston, Mass.) **Is the domain of the psychological still floating?** *International Psychiatry Clinics*, 1970, Vol. 7(2), 240-247.

PSYCHODIAGNOSIS

2616. Adams, Jerry. (William S. Hall Psychiatric Inst., Columbia, S.C.) **Canter Background Interference Procedure applied to the diagnosis of brain damage in mentally retarded children.** *American Journal of Mental Deficiency*, 1970(Jul), Vol. 75(1), 57-64.—Evaluated the efficacy of Task-Central and Task-Peripheral forms of the Canter Background Interference Procedure for the diagnosis of brain damage in mentally retarded children. 30 brain-damaged and 30 non-brain-damaged 6-16 yr. old children were tested on both forms, several days apart, with counterbalanced presentation. A Type IV analysis of variance revealed no sequence or order effect and a significant difference between the 2 groups only on the Bender Error score. The 2 forms differed significantly on the difference score and the Number Positive, but not as a function of diagnostic category. Discriminant analyses revealed significant multiple correlations with diagnosis for each form, although the accuracy of prediction was low. Because the comparison of the 2 forms was difficult to interpret, a conceptual link to present literature remains to be clarified. Results indicate that the performance of older children of average intelligence would be more like that of adults, and several avenues of further research are suggested. (18 ref.)—*Journal abstract*.

2617. Becker, Alois M. (19 Spitalgasse, Vienna, Austria) **Indikation und Prognose in der psychologischen Diagnostik für den praktizierenden Arzt.** [Indications and prognosis in psychological diagnostics for the medical practitioner.] *Praxis der Psychotherapie*, 1969(Jan), Vol. 14(1), 48-52.—Discusses the role of the general practitioner in ruling out somatic diagnoses, advising patients of the need for psychiatric consultations, and instigating abortive drug therapy. The major difficulty lies in the fact that while patients will readily accept a somatic diagnosis, they frequently reject advice which entails obtaining a psychiatric consultation.—B. A. Stanton.

2618. Chandler, Michael J. (U. Rochester) **Self-**

- awareness and its relation to other parameters of the clinical inference process. *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 258-264.—Examines the extent to which 30 professional and student psychologists could accurately describe the inference process they followed in converting MMPI scores into descriptive ratings of patient pathology. The correlation between an S's ratings and set of derived judgments based on a series of subjective weights presumed to reflect the relative importance attached to available predictor variables was used as an index of level of awareness. In sharp contrast to previously reported results, these Ss were characterized by a substantial degree of awareness, and the extent of this capacity was related to their level of clinical training and the appropriateness of the confidence with which their judgments were made. (18 ref.)—*Journal abstract*.
2619. Engelhardt, George M. (Wayne State U., Coll. of Education) **Predicting rehabilitation of socially maladjusted boys.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 546-549.—Investigated whether it is possible to identify the potential rehabilitant or nonrehabilitant at time of placement in a special education program for socially maladjusted boys. A random sample of boys designated as rehabilitated ($N = 30$) and as nonrehabilitated ($N = 30$) comprised the normative group. The cross-validation group consisted of 30 rehabilitants and 30 nonrehabilitants randomly selected. 10 intellectual functioning variables were included in the multivariate predictive analysis using the linear discriminant function. Discrimination between rehabilitants and nonrehabilitants of the normative group was possible with $p < .001$. Socially maladjusted Ss in the cross-validation group were assigned to the rehabilitated-nonrehabilitated dichotomy. Identification of the rehabilitants and nonrehabilitants was possible with 75% accuracy.—*Journal abstract*.
2620. French, Nancy H. & Heninger, George R. (Yale U., School of Nursing) **A Short Clinical Rating scale for use by nursing personnel: I. Development and design.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 233-240.—Describes the development and design over an 8-mo period of the 13-item Short Clinical Rating scale suitable for use by nursing personnel. Each item consists of a carefully defined component of psychopathology which is rated in a global clinical manner from 0-8 according to specified degrees of severity at scale points 0, 2, 4, 6, and 8. The scale can be used easily and rapidly on an hourly, daily, or weekly basis to provide measurements of the major components of the more severe psychiatric syndromes. Rating data are immediately available without further processing. (15 ref.)—*Journal summary*.
2621. Langen, Dietrich. (U. Mainz, Psychotherapy Clinic, W. Germany) **Die Problematik der Diagnose in der Psychotherapie.** [The problem of diagnosis in psychotherapy.] *Praxis der Psychotherapie*, 1969(Jan), Vol. 14(1), 53-62.—The ambiguity of diagnosis of mental disturbances is aggravated by rigid diagnostic categories. 6 types of mental disturbance always seem to appear: (a) abnormal emotional disturbances, (b) abnormal emotional development, (c) abnormal personality, (d) vegetative regulatory disturbances, (e) sex drive disturbances, and (f) drug habituation.—*B. A. Stanton*.
2622. Mason, E. Mary. (Hampstead Child Therapy Clinic, London, England) **The contribution of the social history in the diagnosis of child disturbances.** *British Journal of Psychiatric Social Work*, 1968(Fal), Vol. 9(4), 180-187.—Asserts the returning importance of the social history, in addition to the psychiatric interview and psychological testing, for a complete diagnostic formulation in children. Purposes of the social history include: (a) eliciting a comprehensive picture of the present stage of development of the child; (b) creating an atmosphere which can overcome the parents' anxiety and the child's possible fear, thus helping to establish a positive attitude toward future treatment; and (c) affording an opportunity to check the parents' report of the child against information the child brings directly to the diagnostic examination.—*P. McMillan*.
2623. Maxwell, A. E. (U. London, England) *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 651-655.—Describes a test for comparing the lateral distributions in square contingency tables obtained when a sample of Ss is classified into k categories ($k > 2$) independently by 2 judges or agents. The test is supplemented by an extension of Q. McNemar's (see PA, Vol. 37:48) test for correlated proportions in a 4-fold table. This extension provides a check on the symmetry of misclassifications.—*Journal summary*.
2624. Mills, David H. (U. Maryland) **Adjectives pertinent to psychotherapy for use with the semantic differential: An heuristic note.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 211-213.—Attempts to get bipolar adjectives pertinent to psychotherapy for use in research with the semantic differential. A total of 41 pairs of adjectives were rated by 15 therapists as to their pertinence. Results are presented for their heuristic value and discussed in terms of their generality. Despite being theoretically biased, they overlap with R. B. Cattell's list of personality sphere variables and have general use.—*Journal abstract*.
2625. Phillips, J. P. (U. Hull, England) **A new type of personal questionnaire technique.** *British Journal of Social & Clinical Psychology*, 1970(Sep), Vol. 9(3), 241-256.—Describes a questionnaire for an individual psychiatric patient, suitable for obtaining relatively precise (interval) scalings of a small number of symptoms. For each symptom, statements are derived in consultation with S, representing graded levels of its possible intensity. A preliminary scaling may be obtained by the S making paired comparison judgments of the differences between these levels. When a scaling of the current level of the symptom is required, S makes paired comparison judgments of the difference between it and each of the statements in turn. After all data have been collected, the significance of changes in the level of the symptom is assessed by means of a final analysis of variance, which also checks the preliminary scaling of statements and tests for systematic inconsistencies in S's responses. 2 computer programs, in the Elliott 803 dialect of ALGOL 60, to check, analyze, and graph the results are reported, and a clinical example presented. (30 ref.)—*Journal abstract*.
2626. Piercy, Dwayne C. (U. Houston) **Idiodynamic associative sets in a clinical population.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5695.
2627. Pilowsky, I. & Boulton, D. M. (U. Sydney, Australia) **Development of a questionnaire-based decision rule for classifying depressed patients.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 647-650.—Following on the application of numerical taxonomy to the problem of classifying depressive

illnesses, a decision rule for identifying class members was developed. Its relationship to ECT response supports the validity of regarding "Class B depression" as representing "endogenous" or "psychotic" depression. The depression questionnaire on which the study was based should prove to be a useful research tool in the field of depressive illness.—*Journal summary*.

2628. Ravensborg, Milton R. (Fergus Falls State Hosp., Minn.) **Empirical validation of automated nursing notes: Informational utility.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 279-282.—Compared automated nursing notes (ANN) with traditional notes (TNN) made by 2 Os as to efficiency in recording and transmitting information and ability to preserve the identifiability of 8 adolescent patients' behavior. Analysis of summaries based on both types of notes showed that ANN yielded more informative reports than TNN, while retaining as much identifiability.—*Journal abstract*.

2629. Revers, Wilhelm J. (U. Salzburg, Psychologische Inst., Austria) **Testdiagnostik des Konfliktes.** [Diagnostic tests of conflicts.] *Praxis der Psychotherapie*, 1969(Jan), Vol. 14(1), 28-33.—Discusses psychological tests which can be of use to psychotherapists in facilitating establishment of a diagnosis and in identifying emotionally charged conflicts. The use of the Rorschach, Szondi, and other projective tests are discussed as a means of identifying neurotic behavior disturbances. The TAT which is seen to be useful in isolating both overt and latent conflicts is emphasized. Limitations (i.e., test interpretation difficulties) are discussed. (21 ref.)—B. A. Stanton.

2630. Rokhlin, L. L. **O differentsial'noi diagnostike shizofrenii, psikhopatii i psikhopatopodobnykh sostoyaniy.** [On differential diagnosis of schizophrenia, psychopathy and psychopathoid states.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970, Vol. 70(2), 235-241.—Discusses the problems of differential diagnosis of schizophrenia, psychopathy, and psychopathoid states of various etiology in young people (mostly 18-25 yr. old girls) with psychopathic and psychopathoid behavior (narcomania, minor criminality, hypochondriacal states, and dysmorphophobia—dysmorphomania). Errors in diagnosis of these people were in the direction of both schizophrenia and psychopathy. Certain cases of pathological, but socially engendered behavior, should not be placed in these usual categories of diagnosis. All diagnoses of the enumerated conditions should take account of the changes which have been occurring in contemporary society under the influence of the scientific and technological revolution. Consideration of the data of social psychology and of microsociological analysis can be useful. These changes involve such factors as automation, mechanization, the strain on the "perception of information due to mass communication," increasing socialization of man, the acceleration and retardation of physical and mental development, etc. (English summary) (19 ref.)—I. D. London.

2631. Sperber, Zanwil. (Cedars-Sinai Medical Center, Los Angeles, Calif.) **Psychodiagnostic appraisal of children in one interview.** *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 99-103.—Illustrates an "approach to psychodiagnostic appraisal of children utilizing a single interview as the observation setting. The style of interview emphasizes the interpersonal relationship of the adult and child and the youngster's use of this relationship and reaction to therapist-like activity of the diagnostician. We also try to

mesh the needs of a particular child and his family to one of the action alternatives available in the clinic."—H. K. Moore.

2632. Strotzka, Hans. (16 Daringergasse, Vienna, Austria) **Diagnose und Diagnostik.** [Diagnoses and diagnostics.] *Praxis der Psychotherapie*, 1969(Jan), Vol. 14(1), 1-9.—Discusses the World Health Organization's international diagnostic classifications of diseases pertaining to mental illness. There are 9 major classifications: psychogenic reactions (behavior disturbances manifest as the result of stress situations); neuroses (depressions, compulsive reactions, conversion reactions, anxiety neurosis, and phobias); character neuroses; psychosomatic disorders; schizophrenic psychosis; schizophrenic episodes; manic depressive psychosis; organic psychosis; and mental retardation.—B. A. Stanton.

2633. Swartz, Jon D. (U. Texas) **Pathognomic verbalizations in normals, psychotics, and mental retardates.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5703-5704.

2634. Tarter, R. E. (U. Oklahoma, Medical Center, Center for Alcohol Related Studies) **Acquiescence in chronic alcoholics.** *Journal of Clinical Psychology*, 1970(Jul), Vol. 26(3), 301-302.—The MMPI was administered to alcoholic, psychiatric, and control Ss. On the Acquiescence scale alcoholics scored significantly higher than the psychiatric and control Ss, and after a 3-mo period the trait appeared to remain stable in the alcoholic group.—E. J. Kronenberger.
